SELECTED WATER RESOURCES ABSTRACTS

VOLUME 7, NUMBER 1
JANUARY 1, 1974

W74-00001 – W74-00550

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 7, NUMBER 1
JANUARY 1, 1974

W74-00001 -- W74-00550

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

METHODOLOGY FOR ASSESSING THE POTENTIAL IMPACT OF URBAN DEVELOPMENT ON URBAN RUNOFF AND THE RELATIVE EFFICIENCY OF RUNOFF CONTROL ALTERNATIVES,
Massachusetts Inst. of Tech., Cambridge. Ralph M. Parsons Lab. for Water Resources and Hydrodynamics.
G. Leclerc, and J. C. Schaake.
Available from the National Technical Information Service as PB-224 477, $6.25 in paper copy, $1.45 in microfiche. Report 167, 1973. 257 p, 66 fig, 28 tab, 40 ref, 4 append. OWRR C-2137 (No 3403) (5). 14-31-0001-3403.

Descriptors: *Urban runoff, *Storm runoff, *Rainfall-runoff relationships, *Urbanization, *Detention reservoirs, *Mathematical models, *Statistical models, Urban hydrology, Surface runoff, Precipitation, Storm drains, Urban drainage, Model studies.

A methodology was developed to assess the potential impact of urban development on urban runoff and to measure the relative efficiency of runoff control alternatives. The methodology utilizes runoff frequency curves, derived at different stages of development of the urban catchment. Comparisons of these curves completely quantify the impact of urban development and/or the efficiency of a control structure. Runoff frequency curves are derived directly from the rainfall process. The method of solution utilizes a stochastic model of the rainfall process and a deterministic model of the catchment. The rainfall model describes the rainfall exterior and the rainfall interior and preserves the Intensity-Duration-Frequency curves of the historical rainfall sample. The catchment model developed with the kinematic wave equations is a modular model; detailed and simplified configurations of the prototype catchment have been successfully developed. Filter theory is used to estimate the parameters of the infiltration model from observations of the rainfall and of the runoff. The method of solution, referred to as stochastic/deterministic simulation, incorporates the stochastic rainfall model, the deterministic catchment model, and the results of the infiltration estimator. Results show that the solution procedure and the methodology developed are recommended for urban drainage analysis.

INTERACTION OF BULK PRECIPITATION, STREAM WATER, AND SEWAGE IN A SMALL WATERSHED NEAR OXFORD, MISSISSIPPI,
Mississippi Univ., University. Dept. of Geology and Geological Engineering.
K. J. Banaszak, C. B. Whitten, and D. A. Thompson.
Available from the National Technical Information Service as PB-224 434, $3.75 in paper copy, $1.45 in microfiche. Mississippi State University, Mississippi. State Water Resources Research Institute Report, August 1973. 70 p, 21 fig, 11 tab, 155 ref. OWRR A-063-MISS (1).

Descriptors: Weathering, Chemical reactions, Heavy metals, Soils, *Mississippi, *Small watersheds, *Precipitation (Atmospheric), *Sewage, *Streamflow, Discharge (Water), Storm runoff, Chemical analysis.
Identifiers: *Oxford (Miss), *Urban watersheds.

A 500 hectare (54% forest, 26% pasture and fallow field, and 20% rural urban) rainfed watershed near Oxford, Mississippi was studied from July 1, 1972 to June 30, 1973. During this period, 200 centimeters (132 cm are 'normal') of precipitation with an average pH of 4.6 and an average composition in parts per million of 0.66 calcium, 0.04 magnesium, 0.54 sodium, and 0.23 potassium fell. The stream discharge of 80 centimeters had a neutral pH and an average composition in parts per million of 6.4 calcium, 1.5 magnesium, 6.4 sodium, 2.2 potassium, 13 bicarbonate, 12 sulfate, and 5.5 chloride. A sewage influx of 50 liters per second had little noticeable effect on the composition of storm runoff. The reasons for the change from bulk precipitation to stream water are not clear but must involve biologic, aerosol, and anthropogenic material. The change is compatible with a change from a water in equilibrium with gibbsite to a water in equilibrium with gibbsite and kaolinite. The net output for the study year from the watershed in kilograms per hectare-year was 43 for calcium, 12 for magnesium, 44 for sodium, 14 for potassium, and 36 for silica. These outputs are not compatible with earlier studies but are compatible with gross chemical erosion rates. Data for cadmium and zinc were inconclusive.

WATER IN THE SAN LUIS VALLEY, SOUTH-CENTRAL COLORADO,
Geological Survey, Denver, Colo.
P. A. Emery, R. J. Snipes, J. M. Dumeyer, and J. M. Klein.
Colorado Water Resources Circular No 18, 1973. 26 p, 7 fig, 10 plate, 2 tab, 14 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater resources, *Hydrologic data, *Colorado, Water quality, Mountains, Snowmelt, Streams, Aquifer characteristics, Hydrogeology, Valleys, Water wells, Water utilization, Irrigation, Domestic water, Livestock, Confined water, Water yield, Groundwater recharge, Chemical analysis, Hydrologic budget, Deserts.
Identifiers: *San Luis Valley (Colo).

The San Luis Valley of south-central Colorado is a high mountain desert with an area of approximately 3,200 square miles. It has an average altitude of about 7,700 feet, and the annual precipitation averages about 7.5 inches. The primary source of water to the valley is surface-water inflow derived chiefly from snowmelt. About 86% of the water supplied to the valley by surface-water inflow and precipitation is consumed by evapotranspiration. Irrigation has increased during the last two decades, mainly due to substantially increased withdrawal of groundwater. More than 1,800 large-capacity irrigation wells withdraw water from the unconfined aquifer. Water is withdrawn from the confined aquifer by more than 650 large-capacity irrigation wells and about 7,000 small-capacity domestic, stock, and pasture-irrigation wells. The chemical quality of water in the unconfined aquifer is excellent around the rim of the valley. In the central part of the valley water in the confined aquifer has a brownish color and contains gas. This colored water is commonly associated with high fluoride concentration and high salinity and alkali hazard. The chemical quality of surface water is generally excellent; the dissolved solids concentration ranged from 25 to 450 mg/liter in 28 of the 32 streams sampled. (Woodard-USGS)

ESTIMATING THE PRECIPITATION CLIMATE,
Scripps Institution of Oceanography, La Jolla, Calif.
C. K. Stidd.
Water Resources Research, Vol 9, No 5, p 1235-1241, October 1973. 4 fig, 1 tab, 10 ref.

Descriptors: *Flood forecasting, *Estimating, *Droughts, *Precipitation (Atmospheric), Statistics, Rainfall-runoff relationships, Flood frequency, Statistical methods, Monte Carlo method, Data collection.

Climatic expectancies of flood or drought may be estimated from the mean and variance of a precipitation record. An interrelationship between the distributions of measurements from various observing periods allows any one of these records to be used to estimate the others. The method is based on the cube root normal distribution of precipitation and on an observed tendency for the distribution lines to be parallel. Graphs and tables are provided as an aid to making these estimates. The relationship between monthly, daily, and other measurements must be derived from the frequency spectrum of precipitation rates. This spectrum has the same profile as the theoretical spectrum for atmospheric pressure; thus the spectrum of kinematic energy regulates the relationship between precipitation distributions. (Knapp-USGS)
W74-00375

LOSS OF PARTICULATE ORGANIC MATERIALS FROM SEMIARID WATERSHEDS AS A RESULT OF EXTREME HYDROLOGIC EVENTS,
Utah State Univ., Logan. Watershed Science Unit.
G. F. Gifford, and F. E. Busby.

Water Resources Research, Vol 9, No 5, p 1443-1449, October 1973. 5 fig, 1 tab, 9 ref.

Descriptors: *Rainfall-runoff relationships, *Runoff, *Overland flow, *Nutrient removal, Floods, Organic matter, Nutrients, Deserts, *Utah.

Three debris basins in southern Utah were sampled to determine the amount of particulate organic debris deposited as a result of a single extreme runoff event on each of the three semiarid watersheds above the basins. The total quantity of large particulate organic materials lost from each contributing area ranged from 64.06 kg/ha to 12.89 kh/ha. Vegetation on the watersheds was primarily big sagebrush, pinyon, and Utah juniper. Nutrient losses due to the removal of particulate organic materials from each watershed were also approximated. TROPICAL CYCLONE PRECIPITATION IN NEW JERSEY,
Rutgers--The State Univ., New Brunswick, N.J. Dept. of Meteorology.
E. A. Brotak, and M. D. Shulman.
New Jersey Academy of Science 'Bulletin', Vol 16, No 1-2, p 2-7 Spring-Fall, 1971. 5 fig, 6 tab, 16 ref.

Descriptors: *Tropical cyclines, Hurricanes, *New Jersey, Climatology, *Precipitation (Atmospheric), Storms, Seasonal.
Identifiers: *Cyclone precipitation.

All tropical cyclines producing measurable precipitation in New Jersey for the period 1930-1969 were analyzed to determine their origin, intensity, movement, and precipitation amounts. There were 46 such storms with most occurrences in August and September. Percentages of total monthly and annual precipitation are given for 21 selected stations scattered throughout the state. Annual percentages of precipitation caused by tropical cyclines range from 5 or 6% in the south to 3 or 4% in the north. Monthly percentages up to 40% were recorded in the southeastern part of the state for September.
W74-00435

VARIATION OF THE LOW LEVEL WINDS DURING THE PASSAGE OF A THUNDERSTORM GUST FRONT,
Pennsylvania State Univ., University Park.
R. W. Sinclair, R. A. Anthes, and H. A. Panofsky.
Available from NTIS, Springfield, Va. 22151 NASA CR-2289 Price $3.00 printed copy; $1.45 microfiche. National Aeronautics and Space Administration Contractor Report NASA CR-2289, July 1973. 65 p, 29 fig, 3 tab, 15 ref. NASA Contract NAS8-27334.

Descriptors: *Thunderstorms, *Wind velocity, *Aircraft, Shear strength, Statistical analysis, Meteorological data, *Florida, *Oklahoma, Altitude, Winds, Variability, Forecasting, Regression analysis, Atmospheric physics.

One atmospheric phenomenon that may adversely affect the operation of aeronautical systems is the cold surge or gust front accompanying thunderstorms. Three time histories of wind profiles in thunderstorm gust fronts at Cape Kennedy and three at Oklahoma City are analyzed. Wind profiles at maximum wind strength below 100 m follow logarithmic laws, so that winds above the surface layer can be estimated from surface winds once the roughness lengths is known. A statistical analysis of 81 cases of surface winds during thunderstorms at Tampa revealed no predictor with skill to predict the time of maximum gust. Some 34% of the variance of the strength of the gust is accounted for by a stability index and surface wind prior to the gust; the regression equations for these variables are given. The coherence between microscale wind-speed variations at the different levels has the same proportions as in nonthunderstorm cases. (Woodard-USGS)
W74-00545

2C. Snow, Ice, and Frost

NUTRIENT FACTORS LIMITING PRIMARY PRODUCTIVITY IN SIMULATED AND FIELD ANTARCTIC MICROECOSYSTEMS,
Virginia Commonwealth Univ., Richmond. Dept. of Biology.
For primary bibliographic entry see Field 05C.
W74-00069

THE GROWTH OF PINGOS, WESTERN ARCTIC COAST, CANADA,
British Columbia Univ., Vancouver. Dept. of Geography.
J. R. Mackay.
Canadian Journal of Earth Sciences, Vol 10, No 6, p 979-1004, June 1973, 24 fig, 4 tab, 57 ref.

Descriptors: *Permafrost, *Canada, *Arctic, Freezing, Frost, Frost heaving, Silts, Lakes, Lake beds, Soil mechanics.
Identifiers: *Pingos.

The growth rates of 11 closed system pingos were measured by precise levelling of permanent bench marks anchored well down into permafrost. The rate of growth of the pingo decreases from the summit to the base, and the rate of the growth of the ice-core decreases from the center out to the periphery. The pingos grow in the bottoms of lakes which have drained rapidly and thus become exposed to permafrost aggradation. The specific site of growth is usually in a small residual pond where permafrost aggradation is retarded. The size and shape of a residual pond exercises a strong control upon the size and shape of the pingo which grows within it. The icecore thickness equals the sum of the pingo height above the lake flat and the depth of the residual pond in which the pingo grew. Pingos tend to grow higher rather than both higher and wider. Pingos are believed to grow more by means of ice segregation than by the freezing of a pool of water. The water source, and the associated positive pore water pressure, result from permafrost aggradation insands and silts in the lake bottom under a closed system with expulsion of pore water. The fastest growth rate of an icecore for the Western Arctic Coast is estimated at about 1.5 m/yr for the first 1 or 2 years. After that, the growth rate decreases inversely as the square root of time. The largest pingos may continue to grow for more than 1,000 years. At least five pingos have commenced growth since 1935. Probably 50 or more pingos are now growing along the coast. (Knapp-USGS)
W74-00098

RESULTS OF AN OPERATIONAL TEST OF M--100 RADIO-ELECTRONIC SNOW GAGES,
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
Z. A. Mikhaylova, and V. I. Ponomarev.
Soviet Hydrology: Selected Papers, No 4, p 320-324, 1971. 2 fig, 2 tab, 1 ref. Translated from Transactions of State Hydrologic Institut (Trudy GGI), No 189, p 83-88, 1971.

Descriptors: *Precipitation gages, *Testing, *Testing procedures, *Snow, *Snow surveys, Water equivalent, Radiation, Gamma rays, Winter, Equations.
Identifiers: USSR, Snow courses.

Operational tests were performed on 19 M-100 radio-electronic snow gages in the winter of 1968-69 to determine their basic operational characteristics and possible use as a replacement for the weighing-type snow gage. Upon elimination of constructional inadequacies and with proper operational conditions, the M-100 snow gage can be used in the Hydrometeorological Service network for snow surveys in regions with continuous snow cover. (Josefson-USGS)
W74-00109

EFFECT OF AN ERROR IN THE DETERMINATION OF THE MAXIMUM WATER EQUIVALENT OF SNOW IN A BASIN ON THE FORECAST ACCURACY OF THE SPRING FLOOD VOLUME,
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).
R. A. Nezhikhovskiy.
Soviet Hydrology: Selected Papers, No 4, p 324-327, 1971. 2 tab, 6 ref. Translated from Transactions of State Hydrologic Institute (Trudy GGI), No 193, p 62-66, 1971.

Descriptors: *Water equivalent, *Snowpacks, *Watersheds (Basins), *Flood forecasting, Flood discharge, Spring, Snow surveys, Correlation analysis, Equations.
Identifiers: USSR.

The acceptable accuracy with which average maximum water equivalent of snow in a basin can be determined and the effect which an error in determination of maximum water equivalent has on closeness of stochastic relations used in spring-flood forecasting are examined. With considerable variability in maximum water equivalent and flood runoff, the accuracy with which water equivalent is determined has relatively little effect on the closeness of predictive relations. An increase in the accuracy of determination of maximum water equivalent in a basin is a prerequisite for improving quality of spring runoff forecasts in northern regions. For rivers in southern regions, additional factors must be considered, including permeability of soils before start of snowmelt. (Josefson-USGS)
W74-00110

SHORT-TERM SNOW LOADS,
V. I. Lipovskaya.
Soviet Hydrology: Selected Papers, No 4, p 337-341, 1971. 2 fig, 3 tab, 9 ref. Translated from Transactions of the Voyeykov Main Geophysical Observatory (Trudy GGO), No 283, p 35-42, 1971.

Descriptors: *Snow, *Snowpacks, *Snow cover, *Loads (Forces), Weight, Density, Depth, Snowfall, Storms, Winds, Probability, Curves, Equations.
Identifiers: USSR.

Loads created by snow accumulation must be computed for short periods of time as well as for an entire winter. To estimate magnitude of short-term heavy loads, the weight of snowpack produced by great snowfalls must be considered. A snow density of 0.14 g/cu cm was assumed for the Volga Region, the southern Urals, southern West Siberia, Kazakhstan, Sakhalin, and coastal areas of the Arctic Ocean, while a value of 0.11 g/cu cm was used for all other regions. Maximum daily snow loads ranging from 15 to 115 kg/sq m

for 55 stations in European and Asiatic Russia and probability values of daily snow loads for 21 stations in the country are tabulated. (Josefson-USGS)
W74-00111

DESCRIPTION OF SNOW TRANSPORT AND SNOW DEPOSITION IN THE EUROPEAN USSR,
V. M. Mikhel', and A. V. Rudneva.
Soviet Hydrology: Selected Papers, No 4, p 342-348, 1971. 2 fig, 2 tab, 11 ref. Translated from Transactions of Main Geophysical Observatory (Tudy GGO), No 283, p 87-96, 1971.

Descriptors: Snow, *Snow cover, *Snow surveys, Winds, Winter, Probability, *Maps.
Identifiers: *European USSR, *Snow transport, Drifting snow, Blowing snow.

Patterns of snow transport and accumulation in winter during periods of blowing and drifting snow were investigated for the European part of the USSR. The volumes of snow transported and deposited over the territory vary widely and are mapped and tabulated with a probability of 5%. (Josefson-USGS)
W74-00112

DETERMINATION OF THE DURATION OF NATURAL HYDROLOGIC PERIODS,
B. A. Krutskikh, and Yu. A. Gorbunov.
Soviet Hydrology: Selected Papers, No 4, p 348-354, 1971. 3 fig, 4 tab, 8 ref. Translated from Problems of the Arctic and Antarctic (Problemy Arktiki i Antarktiki), No 38, p 22-28, 1971.

Descriptors: *Oceanography, *Hydrology, *Frequency, Time, Sea level, Water levels, Water level fluctuations, Variability, Water temperature, Salinity.
Identifiers: USSR, *East Siberian Sea, *Chuckchee Sea.

Hydrologic processes on a medium synoptic scale of 1 to 10 days are analyzed with allowance for their development and variations in time and space. An objective classification is made of space-time series of sea level, water temperature, and salinity to determine limits of unidirectional variations in elements of a sea's hydrologic regime, and a spectral analysis is made of initial data to determine duration of natural hydrologic periods more reliably. Based on investigations conducted at six polar stations in the East Siberian and Chuckchee Seas in July-October 1958-68, recurrence of low frequencies in water temperature and salinity variations is higher than for sea level. Results of determinations of recurrence periods by different methods attest to reliability of the established duration of natural hydrologic periods and can serve as a basis for further studies of processes within the limits determined on the basis of an objective classification. (Josefson-USGS)
W74-00113

DETERMINATION OF LIQUID RUNOFF FROM THE FIRN FIELD OF A GLACIER,
P. F. Shabanov, K. G. Makarevich, and Ye. N. Vilesov.
Soviety Hydrology: Selected Papers, No 4, p 363-370, 1971. 5 fig, 7 ref. Translated from Geophysical Bulletin (Geofizicheskiy Byulleten'), No 24, p 29-38, 1971.

Descriptors: *Glaciers, *Firn, *Runoff, *Snowmelt, *Water equivalent, Melting, Ablation, Ice, Infiltration, Snow surveys, Mountains, Maps, Equations.
Identifiers: *Zailiski Ala Tau (USSR), Glacier mass balance, Firn line Superimposed ice, Isolines.

Investigation of runoff from the accumulation area as well as from the tongue of mountain glaciers at middle latitudes is an important problem in modern glaciology. Investigations were conducted on the Central Tuyuksu Glacier in the Zailiski Ala Tau mountain range to obtain data on runoff from the firn basin. Surface layers of a glacier accumulation area are diagrammed, and maps of the accumulation area of the Central Tuyuksu Glacier show distribution of observation points; isolines of water equivalent of snow (mm) during maximum accumulation in winter and spring of 1966-67; isolines of water equivalent of residual snow (mm) at the end of the ablation period in 1967; and isolines of superimposed ice (mm of water depth). (Josefson-USGS)
W74-00115

EFFECT OF SALINITY ON THE OPTICAL EXTINCTION OF SEA ICE AT 6328A,
Cold Regions Research and Engineering Lab., Hanover, N.H.
H. Davis, and R. H. Munis.
Research Report 308, July 1973. 14 p, 7 fig, 4 tab, 8 ref, append.

Descriptors: *Sea Ice, *Heat balance, *Optical properties, *Light penetration, Correlation analysis, Salinity, Analytical techniques, Radiation, Wavelengths, Evaluation.
Identifiers: *Laser, Monochromatic light, Angstrom.

The penetration of shortwave radiation into sea ice is very important in specifying its heat balance. It is therefore necessary to understand the penetration of radiation of different wavelengths through sea ice under varying conditions. An investigation was made to determine the relationship between the extinction coefficient and the salinity of sea ice. A HeNe laser was used to propagate a beam of red light, of wavelength 6328 Angstroms through a series of ice samples at -20 deg C. The optical extinction coefficients were calculated and plotted against the measured salinities. The results of the experiment indicated an exponential relationship between extinction coefficient and salinity. (Woodard-USGS)
W74-00333

SOLUBLE PARTICULATES IN ICE FROM SITE 2, GREENLAND,
Nevada Univ., Desert Research Inst., Reno.
G. O. Linkletter.
Army Cold Regions Research and Engineering Laboratory Special Report 188, July 1973. 17 p, 3 fig, 5 tab, 31 ref, 2 append. NSF Grant 104.

Descriptors: *Glaciology, *Ice cover, *Chemical properties, *Polar regions, Physical properties, Sampling, Cores, Depth, Chemical analysis, Hydrologic cycle, Glaciers, Correlation analysis, Evaluation.
Identifiers: *Greenland, Ice accumulation.

Several investigators have found seasonal layering in snow in northern Greenland, and Langway (1962, 1967) has shown that certain physical and chemical parameters retain their cyclic behavior to at least 100 m depth. Collections of soluble and insoluble particles made by sublimation techniques from small pieces of polar ice are well suited for microscopic and microchemical analysis. Examination of an 89-cm vertical profile of a polar ice core from a depth of 100 m at Site 2, Greenland, indicated no seasonal cycle in the abundance of particules greater than 2 micrometers in diameter. Microchemical spot tests made on individual particles indicated the presence of NH4, K, Ca, Na and C1. Whole filter spot tests for K indicated no systematic variation in the concentration of potassium-bearing particles. Approximately 4% of the particles greater than 2 micrometers were soluble salts of Na, K, Mg, and Ca. The concentrations of Na, K, Ca and Mg were measured in melted fractions of the same core profile by atomic absorption spectrophotometry. Variation of the K concentration and variation of the number of potassium-bearing particles per gram of ice have a correlation coefficient of 0.93 over the 2.5 years of accumulation studied. ANTICIPATED CLOSURE RATES FOR A PROPOSED DRILL HOLE, ROSS ICE SHELF, ANTARCTICA,
Cold Regions Research and Engineering Lab., Hanover, N.H.
J. Weertman.
Special Report 190, July 1973. 8 p, 3 fig, 1 tab, 17 ref.

Descriptors: *Glaciology, *Rheology, *Creep, *Antarctic, Methodology, Data collections, Drill holes, Glaciers, Movement, Velocity, Ice.
Identifiers: *Ross Ice Shelf (Antarctica).

Closure rates are calculated for the proposed drill hole through the Ross Ice Shelf, Antarctica at 166 deg W, 82 deg 30 min S. Closure rates are calculated using the best experimental data on power law creep of polycrystalline ice. Without pressurization of the drill hole closure rates greater than 0.1% per day are estimated to occur at the bottom of the drill hole. (Woodard-USGS)

QUATERNARY GLACIATION IN TRANSBAYKALIA (CHETVERTICHNOYE OLEDENENIYE ZABAYKAL'YA),
V. V. Zamoruyev.
Vsesoyuznoye Geograficheskoye Obshchestvo Izvestiya Vol 105, No 3, p 229-236, May-June 1973. 56 ref.

Descriptors: *Glaciation, *Glaciers, *Glacial sediments, *Glacial drift, *Quaternary period, Stratigraphy, Paleoclimatology, Topography, Mountains.
Identifiers: *USSR (Transbaykalia), Glacier recession, Tectonics.

Quaternary glaciation in the Transbaykal Region was of the mountain type and confined to individual mountain massifs. On the basis of generalization of available data, traditional concepts of 'maximum' Middle Quaternary glaciation must be reexamined. The presence of glacial deposits of this age cannot be considered as conclusive evidence. Existing data in the literature on traces of 'maximum' glaciation are contradictory and conflict with present data on evolution of climate and topography. Glaciation was determined by interaction of climatic and tectonic factors, of which climate was the most important. Initial stages of glaciation must be correlated with Middle Quaternary cooling. Greatest glacier development occurred at the end of Late Quaternary time, and formations developed during the maximum stage are clearly defined and relatively thick. Glacier recession in many cases was stadial in character. Glacial deposits at the time of glacier maximum development and subsequent shrinkage can be compared with the Sartanskiy horizon in the stratigraphic classification. (Josefson-USGS)
W74-00343

INVESTIGATION OF ICE MOVEMENT ON MOUNTAIN GLACIERS BY STEREOPHOTOGRAMMETRY (ISSLEDOVANIYE DVIZHENIYA L'DA GORNYKH LEDNIKOV STEREOFOTOGRAMMETRICHESKIM METODOM),
I. F. Knizhnikov.
Izadatel'stvo 'Nauka', Moscow, 1973. 106 p.

Descriptors: *Photogrammetry, *Glaciers, Mountains, *Ice, Movement, Velocity, Rates, Aerial photography, Mapping, Surveys, Measurement, Instrumentation, International geophysical year, International hydrological decade, Equations.

Identifiers: *Caucasus, *USSR (Tien Shan), *Stereophotogrammetry, Stereocomparators, Geodesy, Phototheodolites, Second International Polar Year.

Development and present state of application of terrestrial photogrammetry in glaciological investigations, and modern methods of measurement of glacier surface velocities are discussed. Attention is focused on theoretical and experimental research designed to improve the method of pseudo parallaxes employed in the measurement of ice motion at 800 points on Elbrus glaciers in the Caucasus. The rate of ice movement on Elbrus glaciers varies between several millimeters and 140 cm/day (about 0.5 km/year). On the basis of repeated phototheodolite surveys in Central Tien Shan, the rate of ice motion in terminal portions of receding mountain glaciers is several meters a year. The Zeiss phototheodolite 19/1,318 best satisfies the requirements of a glacier survey, although it is not readily adaptable to alpine conditions because of its weight. Results of a stereophotogrammetric determination on ice-movement velocities in 14 glaciers in the Caucasus and Tien Shan in 1955-63 are graphed, tabulated, and mapped. (Josefson-USGS)

ALTERNATIVE METHODS OF ESTIMATING SNOW WATER PARAMETERS,
Idaho Univ., Kimberly. Water Resources Research Inst.
D. L. Reese, H. F. Mayland, and C. E. Brockway.
Water Resources Research, Vol 9, No 5, p 1433-1439, October 1973. 2 fig, 3 tab, 5 ref.

Descriptors: *Water yield, *Snowmelt, *Statistical methods, Regression analysis, Frequency analysis, Snowpack, Snow surveys, Water equivalent, Runoff forecasting.

A recurrence analysis technique uses probability and contingency relationships of snow depth, water equivalent, and snow density to estimate snow water. Regression techniques are based on the value from the previous month, the value from a reference site, and the month to previous month contingency parameter of the reference course. Correlation of estimated values to measured values indicated equal reliability of recurrence and regression analysis when any of the methods were used. The recurrence technique can successfully be used in estimating snow water and probability of yield. This technique like the regression technique requires a basic data set before it can be applied. EVIDENCE OF A SURGE ON BARNES ICE CAP, BAFFIN ISLAND,
Department of the Environment, Ottawa (Ontario). Inland Waters Directorate.
G. Holdsworth.
Candadian Journal of Earth Sciences, Vol 10, No 10, p 1565-1574, October 1973. 8 fig, 1 tab, 22 ref.

Descriptors: *Glaciers, Movement, *Glaciation, Glaciology, *Canada, *Surges, Regimen, Arctic.
Identifiers: *Glacial surges, *Baffin Island.

A source on Barnes Ice Cap, Baffin Island is shown by several independent sources of evidence. Recently obtained and previously published flow rate, ice depth, and temperature measurements available in the region of the south dome enable a closer examination of one of the postulated surge areas on the south section of the south dome. The additional geophysical evidence is also supported by independent observations of a geological-hydrological nature in and adjacent to Generator and Flyway Lakes. It seems likely that the surge occurred in this century. The total area affected was about 240 sq km, including 'transition zones'. The increase in area of the dome was about 35 sq km in the form of the south lobe, and the increase in length of the southwest flow line was about 56%, taking account of the displaced divide. EVAPORATION AND COOLING OF A LAKE UNDER UNSTABLE ATMOSPHERIC CONDITIONS,
Cornell Univ., Ithaca, N.Y. School of Civil and Environmental Engineering.
R. N. Weisman, and W. Brutsaert.
Water Resources Research, Vol 9, No 5, p 1242-1257, October 1973. 10 fig, 3 tab, 26 ref.

Descriptors: *Evaporation, *Lakes, Convection, Advection, Winds, Water temperature, Humidity, Turbulence, Boundary processes, Boundary layers, Meteorology, Mass transfer, Diffusion, Heat transfer.
Identifiers: *Lake evaporation.

Evaporation from a lake involves turbulent diffusion of momentum, sensible heat, and water vapor in the lower atmosphere when a neutral, dry air mass encounters a warm, wet surface. To calculate evaporation, the water surface temperature is specified, and the surface roughness is taken to be constant over land and water. The turbulent fluxes are formulated by a semiempirical turbulence theory with the Businger-Dyer form of the Monin-Obukhov similarity functions, a water vapor buoyancy term in the Obukhov stability length, and Blackadar's scaling height in the mixing length. The resulting solution of the equations of conservation shows that the stability discontinuity at the leading edge can greatly affect the mean rate of evaporation and that the vertical vapor flux can greatly contribute to the atmospheric stability. The solution is relatively insensitive to the exact form of the Monin-Obukhov similarity functions or to the exactness of Reynolds' analogy or von Karman's constant. For large fetches and near-neutral conditions the solution becomes similar to that obtained in Sutton's problem and with Harbeck's empirical formula. (Knapp-USGS)

THE TRANSPIRATION OF CORN,
Baghdad Univ. (Iraq). Coll. of Agriculture.
G. A. Al-Nakshabandi, and H. N. Ismail.
J Agric Sci. Vol 79, No 3, p 501-507. 1972. Illus.
Identifiers: *Corn, Irrigation, Neutron probes, Phaseolus-Aureus, Radiation, *Transpiration, Zea-Mays.

The actual transpiration of corn (Zea mays L.) was determined by hydraulic lysimeters, by the inflow-outflow method and by use of a neutrone probe. Two irrigation treatments were used; wet and dry. Under the wet treatment 740, 858, and 743 mm of irrigation water was used during the seasons 1968, 1969 and 1970, respectively. Under the dry treatment, irrigation water used was 560, 627 and 565 mm during the seasons 1968, 1969 and 1970, respectively. Ratios of actual transpiration (Et) to Penman's estimate of potential evaporation (Eo), evaportion from a Class-B pan (EpB), global radiation (Rg) and net radiation (Rn) were calculated. Values of Et measured by the different methods are in good agreement. Seasonal averages of Et were 6.2 and 4.9 mm/day under wet and dry treatments, respectively. The Et/Eo, Et/EpB, Et/Rg and Et/Rn ratios increased with leaf area index (L.A.I.) and reached their maximum values when L.A.I. reached its maximum value of 1.03 under wet and 0.92 under dry treatment. The empirical coefficient (f ± Et/Eo) under wet treatments was higher than that given by Penman for short grasses and about the same as that obtained by Boumans et al. for golden-gram (Phaseolus aureus) in Iraq for Aug. and Sept. The empirical coefficient Kb in the Blaney-Criddle formula was greater than the value given by Blaney and Criddle for an arid climate, and less than the value obtained by Boumans et al. for golden-gram in Iraq. Water use efficiency for grain production was greater under dry than under wet treatments.--Copyright 1973, Biological Abstracts, Inc.

PROCESSING OF RESULTS OF OBSERVATIONS OF SPRING DISCHARGE,
Ceskoslovenska Akademie Ved, Brno. Geograficky Ustav.
H. Kriz.
Ground Water, Vol 11, No 5, p 3-14, September-October 1973. 7 fig, 9 tab, 5 ref.

Descriptors: *Springs, *Discharge (Water), *Statistical methods, Water yield, Time series analysis, Data collections, Hydrologic data, Data processing, Water measurement.
Identifiers: *Czechoslovakia.

In Czechoslovakia special methods of mathematical statistics are being used for the treatment of results of long-term observations of spring discharges. Examples are given of the statistical treatment of weekly discharges of springs issuing in the eastern margin of the Bohemian Cretaceous Plateau for the years 1901 to 1970. Besides the usual average and extreme discharges of springs, the characteristic discharge, that is the discharge exceeded for the period of n days or n percent per year, is determined. On the basis of these characteristic values it is possible to rate the individual discharges for a longer time, and with an extraordinarily high or low discharge of springs, to calculate the exceptionality of the occurrence. HYDROLOGY AND SEDIMENT TRANSPORT, MOANALUA VALLEY, OAHU, HAWAII,
Geological Survey, Honolulu, Hawaii. Water Resources Div.
B. L. Jones, and C. J. Ewart.
Hawaii Department of Transportation, Highways Division Report No HI-HWY-71-1-II, May 1973. 111 p, 14 fig, 15 plate, 8 tab, 25 ref.

Descriptors: *Streamflow, *Sediment transport, *Hydrologic data, *Hawaii, Rainfall-runoff relationships, Model studies, Data collections, Correlation analysis, Gaging stations, Discharge (Water), Sediment yield, Particle size, Bed load.
Identifiers: *Moanalua Valley (Hawaii).

In November 1970, the State of Hawaii, Department of Transportation, entered into a cooperative agreement with the U.S. Geological Survey to study the hydrology and sedimentation characteristics of Moanalua Valley, Oahu. The primary purpose of this study is the analysis of rainfall-runoff and rainfall-sedimentation relations in a tropical watershed. This report is the first of a series of progress reports on the Moanalua Valley investigation. Preliminary results from the limited use of the U.S. Geological Survey's rainfall-runoff model have been encouraging. The calibration phase based on 10 storms produced a reasonable correlation between simulated and observed peaks. Data collected through July 1972 indicate that Moanalua Stream has a considerable capability of transporting sediment, both as bedload and as suspended sediment. Observations and calculations by the Schoklitsch formulae indicate the stream often moves material in excess of 2 feet in diameter. Calculations of suspended-sediment load, using the instantaneous relation of water and sediment discharge, resulted in a storm load of 12,000 tons for a flood similar to the design flood, or a load equivalent to 4.6 times the computed bedload discharge. (Woodard-USGS)

WATER RESOURCES SUMMARY, ISLAND OF HAWAII,
Geological Survey, Honolulu, Hawaii.
D. A. Davis, and G. Yamanaga.
Hawaii Division of Water and Land Development Report R47, April 1973. 42 p, 7 fig, 1 map, 5 tab, 45 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater resources, *Water quality, *Hawaii, *Reviews, Hydrologic data, Stream gages, Streamflow, Rainfall, Runoff, Water yield, Groundwater, Water wells, Aquifer characteristics, Geomorphology, Perched water, Water storage, Water analysis, Hydrographs, Maps, Bibliographies.

A summary of existing information on water on the island of Hawaii is presented. Shown on the water resources map are (1) principal streams and ditches on the island and the locations of gaging stations; (2) types of occurrence of groundwater; (3) locations of principal wells, springs, and development tunnels; and (4) information on depths of wells, groundwater levels, and salinity of groundwater as indicated by chloride content. Graphs show characteristics of flow of streams at selected gaging stations and a brief description is given of development of streamflow. Brief descriptions are given of the rocks and their water-bearing properties and the occurrence, availability, and quality of groundwater. The report was compiled from published reports and records and from unpublished records in the files of the U.S. Geological Survey and the Hawaii Division of Water and Land Development. A list of selected references gives the principal publications containing information on geology and water resources of the island. (Woodard-USGS)
W74-00355

A RECONNAISSANCE OF THE WATER RESOURCES IN THE PAHSIMEROI RIVER BASIN, IDAHO,
Geological Survey, Boise, Idaho.
H. W. Young, and W. A. Harenberg.
Available from Idaho Dept. of Water Admin., Statehouse Annex 2, Boise, Idaho 83707 - Price $.50. Idaho Department of Water Administration Water Information Bulletin No 31, June 1973. 57 p, 19 fig, 10 tab, 15 ref, append.

Descriptors: *Water resources, *Hydrologic data, *Streamflow, *Groundwater resources, *Idaho, River basins, Water yield, Water quality, Discharge (Water), Sediment transport, Gaging stations, Water wells, Aquifer characteristics, Groundwater movement, Water level fluctuations, Water analysis Chemical analysis, Water utilization, Irrigation, Water supply, Livestock.
Identifiers: *Pahsimeroi River basin (Idaho).

The Pahsimeroi River basin occupies approximately 845 sq mi of east-central Idaho and is tributary to the Salmon River. The economy of the basin is dependent primarily upon livestock raising which in turn is dependent upon irrigation of lands for hay and pasture. A distinctive feature of the basin is the large interchange of water from the surface to the subsurface and back again to the surface. Water from the surrounding mountains seldom reaches the Pahsimeroi River as direct overland runoff. The Pahsimeroi River is principally a groundwater fed stream with maximum mean monthly flows occurring in November and minimum mean monthly flows occurring in May. A 7-day mean discharge in excess of 290 cfs occurs on the average of once in about 2 years; and a 7-day low mean discharge of less than about 102 cfs occurs on the average of once every 2 years. The principal aquifer is the alluvial fill from which measured well yields are as high as 3,850 gpm. The major use of water is for irrigation. In 1971, about 120,000 acre-feet of surface water and about 930 acre-feet of groundwater were used to irrigate approximately 27,000 acres. Both the surface waters and groundwaters of the basin are of good chemical quality and are suitable for all present uses. Future agricultural development in the basin must rely on the development of its groundwater supplies. (Woodard-USGS)

A STREAM LENGTH STUDY,
Institute of Hydrology, Wallingford (England).
K. Blyth, and J. C. Rodda.
Water Resources Research, Vol 9, No 5, p 1454-1461, October 1973. 7 fig, 20 ref.

Descriptors: *Geomorphology, *Streams, *Drainage patterns (Geologic), Hortons law.
Identifiers: *England, *Stream lengths.

The length of flowing channel in a small clay basin in southeast England was observed once per week over a period of 1 year. The main controls of the total length of flowing channel were found to be the effective rainfall during the previous week and the length of stream flowing at the time of the previous week's observation. Variations in the lengths of streams of different orders were studied, first-order streams being found to vary most. (Knapp-USGS)

ON THE ANGULAR ENERGY SPECTRUM OF WIND WAVES,
Y. M. Krylov, S. S. Strekalov, and V. F. Tsyplukhin.
Izvestiya, Academy of Science, USSR, Atmospheric and Oceanic Physics, p 441-446. 5 fig, 2 tab, 14 ref. Trans. from Izv. Akad. Nauk SSSR, Fiz. Atmos. Okeana, Vol 2, No 7, 1966.

Descriptors: *Beaches, Shores, *Ocean waves, *Waves (Water), Refraction, Translation, Coasts.
Identifiers: Energy spectrum, Wind waves, Angular spectrum, Wave energy, *Near shore processes, Surf zone, *Black Sea, Wind generated waves.

The angular spectrum of deep-water wind waves and its variation in the coastal region is considered. The experimental data on the energy distribution in the angular deep-water spectrum confirm the previously suggested hypothetical dependence upon cosine squared theta. By an analysis of the field measurements and the theoretical calculations it could be shown that the angular spectrum in the narrow coastal region before the breaking zone follows the predictions of a linear hydrodynamic theory which is based on the hypothesis that the flux of wave energy is constant for the individual spectral components. WAVE SHOALING,
National Engineering Science Co., Pasadena, Calif.
R. C. Y. Koh, and B. Le Mehaute.
Journal of Geophysical Research, Vol 71, No 8, p 2005-2012, April 15, 1966. 7 fig, 9 ref.

Descriptors: Shores, *Shallow water, *Energy conservation, *Waves (Water), *Coasts.
Identifiers: Stokes theory, *Wave shoaling, Progressive waves, Gravity wave theory.

The transformation of progressive waves as they travel from deep water to the shore is analyzed using the Stokes theory at a fifth order of approximation and the method of conservation of energy flux. The approximation is not uniformly valid because the wave is traveling from deep to shallow water. The first, third, and fifth orders of approxi-

mation are compared with each other and with experiments. The differences between the predictions based on the three orders of approximation are small--of the order of 5%. For most practical purposes the third-order theory would probably give the most reliable results. (Sinha-OEIS)

ON THE ORIGIN OF CERTAIN BREAKERS OFF THE ISLAND OF ARUBA,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
W. S. Wilson.
Available from NTIS as AD-677 052; $6.00 in paper, $1.45 in microfiche. Report No. TR-43, Ref-68-13, October 1968. 34 p, 14 fig, 5 ref. Nonr-4010)11).

Descriptors: *Beaches, Islands, *Coasts, *Waves (Water), *Refraction, Shoals.
Identifiers: *Aruba, Venezuela, Trade Winds, *Breakers, Swell.

Eastward-traveling swell developing into breakers and having a period estimated to be between 13 and 14 seconds appears intermittently along a beach on the lee side of Aruba, an island lying off the coast of Venezuela in the Trade Winds. It is suggested that waves, generated by winter storms off the mid-Atlantic coast of North America, propagate southward to Mona Passage where they are refracted in a shoal area and that they then propagate across the Caribbean Sea toward Aruba where they are refracted in a shoal area off the northwest tip of the island and arrive on the leeward coast. Evidence is presented to support this hypothesis. (Sinha-OEIS)

PROCESSES AFFECTING SEAWATER CHARACTERISTICS ALONG THE OREGON COAST,
Oregon State Univ., Corvallis. Dept. of Oceanography.
J. Pattullo, and W. Denner.
Limnology and Oceanography, Vol 10, No 13, p 443-450, July 1965. 4 fig, 1 tab, 10 ref.

Descriptors: *Coasts, Sea water, *Oregon, *Water temperature, *Salinity, Rainfall, *Mixing, *Columbia River, Surface waters, Water properties.

Local processes that modify surface water properties are described. Temperature and salinity data from Oregon coastal waters during 1961 and 1962 are examined to assess the effects of the various processes. The temperature-salinity pairs are divided into sets; each set is considered as dominated by a single modifying process. The set is defined by a process sector on a T-S field. The percentage of observations in each process sector is determined; these provide a basis for quantitative comparison of different samples of data. During winter, rainfall is the dominant process all along the Oregon coast. Rainfall effects were found in 72% of the winter observations. During summer, two other processes dominate: along the northern Oregon coast, mixing with Columbia River water occurred 23% of the time; near Cape Blanco, upwelling in conjunction with heating was found 42% of the time. (Sinha-OEIS)

WATER WAVES AT THE SHORELINE,
Wisconsin Univ., Madison. Dept. of Mathematics.
A. D. Taylor.
Available from NTIS as AD-478 688; $6.00 in paper, $1.45 in microfiche. Report No. TR-1202 (27)/3, July 1965. 54 p, 8 fig, 8 ref. ONR-1202 (27) NR-083-167.

Descriptors: *Waves (Water), *Shallow water, *Beaches, Mathematics, *Coasts, Equations, *Shores.
Identifiers: *Wave action, Bore-free motion, Laplace transform.

The nonlinear equations of two-dimensional wave motion on a shallow beach are used to study motions starting from rest and developing so that the surface elevation, at a fixed distance from the initial shore position, approaches rapidly an approximately simple-harmonic function of time. The Laplace transform is applied to a related problem and is inverted to obtain the solution of the physical problem when the water motion is bore-free. It is shown, moreover, that the solution does represent a bore-free motion for sufficiently small, non-zero amplitude, except at a set of resonant frequencies. (Sinha-OEIS)

Descriptors: *Storms, Surf, *Beaches, Shores, Coasts, *Waves (Water), *Ocean waves, Translation.
Identifiers: Surf zone dynamics, Swash, *Near shore processes, Wave action, Backwash, Pressure field.

An analysis of surf and swash action during two storms reveals the following: (1) The pressure records generated in the surf zone, and on the upper portions of the fore-shore, exhibit the sawtooth geometry predicted by theoretical analysis; (2) spacing between pressure peaks decreases down the foreshore with increasing distance from the scarp; (3) recorded pressure peaks, which are indistinguishable from those produced by discreet waves, may be generated by surf beat; (4) as the waves become higher in a coastal storm area, transverse movements of swash give backwash (pressure) effects, which do not correspond to wave and swash pressures recorded for given waves; (5) the fact that the operations were carried out on a straight stretch of fine, sandy beach with rectilinear scarp and very gentle foreshore gradient imposes radical limitations upon the generality of the results. The data were collected during 1956 at the Anapa Research Station of the Oceanographic Institute, on the Black Sea. (Sinha-OEIS)

DRAINAGE AREAS OF TEXAS STREAMS, LAVACA RIVER BASIN.
Geological Survey, Austin, Tex.

Open-file report, September 1973. 1 fig, 1 tab.

Descriptors: *Drainage area, *River basins, *Texas, Locating, Indexing, Mapping, Sites, Streams, Networks.

In 1951 the Federal Inter-Agency River Basin Committee, Subcommittee on Hydrology, designated the U.S. Army Corps of Engineers as the coordinating agency for the determination of drainage areas in the Arknasas and Red River basins. The U.S. Geological Survey was designated as the coordinating agency for all other river basins in Texas. These data are being compiled in cooperation with the Texas Water Development Board. Data on the drainage areas of Texas streams are being compiled so that information of uniform accuracy and reliability will be available for hydrualic, or general engineering use. This report gives the drainage areas as determined by measurements at 61 points within the Lavaca River basin. Tabulated are the latitude and longitude of the points of determination and the drainage area in square miles above each point. (Woodard-USGS)

RIVER MILE INDEX-SAN JOAQUIN RIVER, TULARE LAKE AND BUENA VISTA LAKE BASINS, CALIFORNIA.
Bureau of Reclamation, Sacramento, Calif. Mid-Pacific Regional Office.

Pacific Southwest Inter-Agency Committee, Water Management Technical Subcommittee report, May 1973. 121 p, 1 fig.

Descriptors: *Distance, *River systems, *Indexing, *California, Documentation, River basins, Tributaries, Drainage area, Elevation.
Identifiers: *River mile index, *Pacific Southwest, San Joaquin River basin (Calif), Tulare Lake basin (Calif), Buena Vista Lake basin (Calif).

This river mile index for the San Joaquin River, Tulare Lake and Buena Vista Lake basins, California, is one of a series of reports on stream basins in the Pacific Southwest. River mileage designations established on major streams by the Corps of Engineers or the State of California Department of Water Resources have been widely accepted for many years. These designations were used without change where they existed. River mileages for intermediate points and on other streams were determined from independent measurements made on U.S. Geological Survey topographic quadrangles. The U.S. Geological Survey furnished information on stream gage locations, drainage areas, and water elevations at key points. River mile distances were measured upstream from the mouth to the nearest tenth mile. (Woodard-USGS)

July 1973. 56 p, 1 fig.

Descriptors: *Distance, *River systems, *Indexing, *California, *Oregon, Documentation, River basins, Tributaries, Drainage area, Elevation.
Identifiers: *River mile index, *Klamath River basin (Calif and Oreg), Pacific Slope basin, Pacific Southwest.

This river mile index for the Klamath River basin in northern California and southern Oregon is one of a series of reports on major rivers in the Pacific Slope basin. This, in turn, is part of a larger program covering all the major rivers of the Pacific Southwest. Distances and other data were taken primarily from U.S. Geological Survey topographic maps. The U.S. Geological Survey Water Resources Data for California and Oregon was the source for stream gage location, height, and drainage area. Streams are designated by order number to indicate their relationship in the basin network. First order streams are main stem streams with an outlet on the sea. Tributaries to these are second order, etc. In making the index, the river mile distances were measured upstream from the mouth to the nearest tenth of a mile. (Woodard-USGS)

HYDRAULIC TESTING ACCOMPANYING DRILLING OF FIVE EXPLORATORY HOLES, PICEANCE CREEK BASIN, COLORADO,
Geological Survey, Lakewood, Colo.
J. E. Weir, Jr., and G. A. Dinwiddie.
Available from NTIS, Springfield, Va., 22151 as USGS-3002-2 Price $5.45 printed copy; $1.45 microfiche. Contract Report USGS-3002-2, September 1973. 55 p, 40 fig, 1 tab, 1 ref. AEC Contract No. AT (49-16)-3002.

Descriptors: *Core drilling, *Core logging, *Test wells, *Colorado, *Hydrologic data, Hydrogeology, Transmissivity, Aquifer characteristics, Water quality, Specific conductivity, Geology, Rocks, Water levels, Jets, Flow, Groundwater movement, Exploration, Watersheds (Basins).
Identifiers: *Piceance Creek basin (Colo).

Five exploratory core holes which penetrated alluvium and the Green River Formation were drilled in the Piceance Creek basin, Colorado, and hydrologic information was obtained during drilling. Transmissivity of the rocks tested was low (less than 7,500 gallons per day per foot). Field conductance of fluid discharged during drilling ranged from about 500 to about 29,000 micromhos per centimeter. General conclusions, based on comparison and evaluation of available data, are that (1) the rocks having greatest permeability penetrated by the five test holes are above the Mahogany ledge zone in the upper part of the Parachute Creek Member of the Green River Formation; (2) groundwater in the penetrated rocks becomes more mineralized with depth, noticeably at and below the Mahogany ledge zone; and (3) the test holes probably are in an area of potential groundwater discharge. DIGITAL SIMULATION AND PROJECTION OF WATER-LEVEL DECLINES IN BASALT AQUIFERS OF THE ODESSA-LIND AREA, EAST-CENTRAL WASHINGTON,
Geological Survey, Tacoma, Wash.
J. E. Luzier, and J. A. Skrivan.
Open-file report, 1973. 56 p, 29 fig, 12 ref.

Descriptors: *Groundwater resources, *Hydrologic data, *Washington, *Water level flucatuations, Projections, Model studies, Computer models, Analytical techniques, Water wells, Aquifer characteristics, Groundwater movement, Water yield, Water utilization, Groundwater recharge.
Identifiers: *Odessa-Lind area (Wash).

A digital computer program using finite-difference techniques simulates an intensively pumped, multilayered basalt-aquifer system near Odessa, Wash. The aquifers now developed are in the upper 1,000 feet of a regionally extensive series of basalt flows of the Columbia River Group, thousands of feet thick and having a slight southwesterly dip. Most of the aquifers are confined. Those in the depth range of about 500 to 1,000 feet are the chief source of groundwater pumped from irrigation wells. Transmissivity of these aquifers ranges from less than 2,700 sq ft per day to more than 40,000 sq ft per day, and storage coefficients range from 0.0015 to 0.006. Projected average annual rates of decline in the Odessa-Lind area during the 14-year period 1967-81 are: (1) from 1 to 9 feet per year if pumpage is maintained at the 1970 rate of 117,000 acre-feet per year, or (2) from 3 to 33 feet per year if 1970 pumpage is increased to 233,000 acre-feet per year, which includes 116,000 acre-feet per year covered by water-right applications held in abeyance. (Woodard-USGS)

EQUATION FOR ONE-DIMENSIONAL VERTICAL FLOW OF GROUNDWATER: 2. VALIDITY RANGE OF THE DIFFUSION EQUATION,
Centro di Ricerca IBM di Venezia (Italy).
G. Gambolati.
Water Resources Research, Vol 9, No 5, p 1385-1395, October 1973. 14 fig, 8 ref.

Descriptors: *Groundwater movement, *Consolidation, *Compaction, Land subsidence, Subsidence, Deformation, Diffusion, Equations, Aquifer testing, Porous media, Dispersion, Mathematical studies.

The reliability of the parabolic diffusion equation was investigated by solving the rigorous one-dimensional equation of groundwater flow in deforming soils. The dependence of the hydraulic conductivity on the specific weight of water is included. The grain velocity was expanded first. This expansion leads to a nonlinear integro-differential term. An iterative finite element technique of solution was then developed. The true time-dependent pressure head was compared to the standard one. The entire range of variations for the formation parameters was carefully explored. The usual equation gives satisfactory results in the vast majority of applications. The conditions underlying the approximated theory become critical only when the flow field is to be determined in highly compressible units for strong boundary pressure variations. In this case the solid material movements can no longer be considered small. The pressure head changes are faster than it would appear from the standard solution, and the consolidation process is more rapid than that in the classical Terzaghi's theory. DIGITAL MODEL OF THE HYDROLOGIC SYSTEM, NORTHERN HIGH PLAINS OF COLORADO--A PRELIMINARY REPORT,
Geological Survey, Denver, Colo.
R. R. Luckey, and W. E. Hofstra.
Colorado Water Resources Circular 19, 1973. 25 p, 14 fig, 6 ref.

Descriptors: *Groundwater resources, *Water level fluctuations, *Hydrogeology, Colorado, Model studies, Data collections, Correlation analysis, Projections, Water utilization, Withdrawal, Water wells, Groundwater recharge, Hydrology, Aquifers.
Identifiers: *Colorado High Plains.

The hydrologic system in part of the northern High Plains of Colorado was modeled using a finite-difference technique and a digital computer. Models were prepared for the eastern part of Kit Carson and of Yuma Counties, a total area of 2,900 square miles. The models were verified within the limits of the field data by comparing observed and simulated changes in water levels in the groundwater reservoir during 1964-71. The verified models were used to predict declines in the water table by the year 2000. The predictions indicated declines in excess of 80 feet in Kit Carson County and in excess of 90 feet in Yuma County. However, by the year 2000, Yuma County still had a large groundwater supply remaining. The models indicated that the specific yield of the aquifer and groundwater withdrawals must be more accurately determined to refine the model results. (Woodard-USGS)

WATER-LEVEL RECORDS, 1969-73, AND HYDROGEOLOGIC DATA FOR BACA AND SOUTHERN PROWERS COUNTIES, COLORADO,
Geological Survey, Denver, Colo.
L. A. Hershey, and T. J. Major.
Colorado Water Resources Basic-Data Release No 32, 1973. 17 p, 1 fig, 1 plate, 2 tab.

Descriptors: *Groundwater resources, *Water wells, *Water levels, *Basic data collections, *Colorado, Hydrogeology, Well data, Water yield, Aquifers, Mapping, Sites.
Identifiers: Baca County (Colo), Southern Prowers County (Colo).

Water levels measured during 1969-73 are presented for about 270 wells in Baca and southern Prowers Counties, Colo. Details are presented of location, ownership, yield, depth, and other characteristics of 165 wells inventoried. The water levels were measured by the U.S. Geological Survey and Colorado State University personnel. The study is made in cooperation with the Colorado Water Conservation Board as a part of an investigation to identify areas where the groundwater supply is being depleted. The water-level data are needed by State and local agencies to aid in administering and managing the groundwater supply. (Woodard-USGS)

TIME SERIES ANALYSIS OF THE HYDROLOGIC REGIMEN OF A GROUND-WATER DISCHARGE AREA,
Ottawa Univ. (Ontario). Dept. of Civil Engineering.
R. E. Jackson, J. A. Gilliland, and K. Adamowski.
Water Resources Research, Vol 9, No 5, p 1411-1419, October 1973. 4 fig, 18 ref.

Descriptors: *Time series, analysis, *Groundwater, *Discharge (Water), *Water level fluctuations, Hydrogeology, Variability, Markov processes, Evapotransporation, Statistics, Precipitation (Atmospheric), Climates, Water balance, Hydrograph analysis, *Canada.

Time series analysis was employed to examine climatological and hydrogeological variables associated with a groundwater discharge area in Manitoba, Canada. Daily groundwater evapotranspiration and inflow rate were adequately modeled by a first-order Markov process. Nonrandom fluctuations associated with the weather and circulation of the North American summer climate were identified in the time series of mean daily temperature and groundwater evapotransporation; daily precipitation was random. Statistical filtering of the hydrogeological time series showed that two processes were associated with seasonal maximums in the groundwater evapotranspiration series, one due to the propagation of groundwater recharge through the flow system and the other due to climatic effects on the discharge area, in particular, the Lisse effect. GALERKIN SOLUTION OF THE INVERSE PROBLEM FOR AQUIFER TRANSMISSIVITY,
Waterloo Univ. (Ontario). Dept. of Earth Sciences.
E. O. Frind, and G. F. Pinder.
Water Resources Research, Vol 9, No 5, p 1397-1410, October 1973. 11 fig, 20 ref. Canada NRC Grant A 8368.

Descriptors: *Groundwater movement, *Aquifer testing, *Transmissivity, *Finite element analysis, Numerical analysis, Equations, Mathematical models, Flow nets.
Identifiers: *Galerkin method.

The inverse problem in aquifer analysis may be solved by a Galerkin finite element approach. The proposed solution was applied to an inhomogeneous isotropic aquifer for which steady state piezometric head is known and transmissivity is unknown. The condition for existence and uniqueness of a solution is that transmissivity must be known along a line crossed by all streamlines in the flow system. In the Galerkin solution this condition may be stated alternatively in terms of flux, so that knowing the discharge at a well may satisfy the uniqueness requirement. Isoparametric finite elements were used; polynomial shape functions approximated aquifer geometry, hydraulic head, and transmissivity. The flexibility of the isoparametric elements permits using an irregular grid with nodes directly at observation points. The solution is highly sensitive to the degree of approximation in the functional representation of hydraulic head but relatively insensitive to the representation of transmissivity. The finite element solution converges to a unique solution as element size decreases. (Knapp-USGS)

ANALYTICAL SOLUTIONS TO THE ONE--DIMENSIONAL NONLINEAR DIFFUSION EQUATION FOR FLOW THROUGH POROUS MEDIA,
Geological Survey, Denver, Colo.
A. F. Moench.
Water Resources Research, Vol 9, No 5, p 1378-1384, October 1973. 4 fig, 3 tab, 4 ref.

Descriptors: *Diffusion, *Groundwater movement, *Numerical analysis, *Porous media, Transmissivity, Equations, Mathematical studies, Soil water movement, Saturated flow, Unsaturated flow.

The one-dimensional nonlinear diffusion equation was solved approximately by an extension of the Neumann method for a step input to a semi-infinite medium. The method of solution requires that the region under consideration be divided into an arbitrary number of zones, each zone having known constant diffusivities. The boundaries between zones move at rates that are initially unknown. Two problems were considered: (1) horizontal flow in an aquifer in which the transmissivity and storage coefficients are functions of hydraulic head and (2) horizontal absorption in an unsaturated soil for which the diffusivity is a function of moisture content. Computational results compare well with finite difference and other numerical solutions to the same problems. The technique has application to other nonlinear problems of the same type. (Knapp-USGS)

EXPERIMENTAL AND MATHEMATICAL MODELING OF LIQUID-LIQUID MISCIBLE DISPLACEMENT IN POROUS MEDIA,
Kansas Univ., Lawrence. Dept. of Chemical and Petroleum Engineering.
S. S. Chhatwal, R. L. Cox, D. W. Green, and B. Ghandi.
Water Resources Research, Vol 9, No 5, p 1369-1377, October 1973. 10 fig, 1 tab, 13 ref.

Descriptors: *Dispersion, *Mixing, *Groundwater movement, Saline water intrusion, Path of pollutants, Diffusion, Numerical analysis, Convection, Mathematical models, Hydraulic models.

When one liquid in a porous medium displaces a second miscible liquid of different density, both gravity effects and dispersion are present at the liquid-liquid interface. Equations describing this process were solved numerically. The method of characteristics numerical solution and a new technique (the centered in distance, centered in time method) were evaluated by direct comparison and by checking against an analytical solution for the case of one-dimensional flow. The solutions were used to simulate saltwater displacement experiments in a two-dimensional laboratory model as a further test. (Knapp-USGS)

METHOD FOR NUMERICAL SIMULATION OF FLOW IN MULTIAQUIFER SYSTEMS,
Illinois Univ., Chicago. Dept. of Geological Sciences.
Z. A. Saleem.
Water Resources Research, Vol 9, No 5, p 1465-1469, October 1973. 2 fig, 14 ref.

Descriptors: *Simulation analysis, *Numerical analysis, *Groundwater movement, *Aquifer characteristics, Aquicludes, Artesian aquifers, Confined water.
Identifiers: Multiaquifer systems.

A model for simulation of groundwater flow in multiaquifer systems was developed. A system of nonlinear partial differential equations that are isomorphic to groundwater flow in the system was formulated in a finite difference form suitable for the line successive overrelaxation technique. The resulting system of difference equations is solved by using an efficient algorithm. The algorithm serves as a means for solving the bitridiagonal system of difference equations representing flow in two aquifers simultaneously. Storativity of the semiconfining layer can be considered indirectly or can be neglected. The results derived from the numerical simulator for the flow to wells in two coupled aquifers are in good agreement with analytical results for the same system. (Knapp-USGS)
W74-00382

ELECTRICAL RESISTIVITY SOUNDINGS ON THE COASTAL PLAIN OF SOUTHEASTERN VIRGINIA: A FEASIBILITY STUDY,
Old Dominion Univ., Norfolk, Va. Dept. of Geophysical Sciences.
M. A. Sabet.

Completion Report Submitted to Virginia Polytechnic Institute and State University, Blacksburg, Water Resources Research Center (1972). 17 p, 41 fig, 4 ref.

Descriptors: *Resistivity, *Coastal plains, *Aquifers, Groundwater, *Virginia, Geophysics, Electrodes.
Identifiers: Tidewater, *Schlumberger array, Dismal Swamp (Va).

A total of 39 vertical electrical resistivity soundings (VES) were made on the Coastal Plain Region of Southeastern Virginia. The Schlumberger array was used throughout the study. The maximum distance between the current electrodes was 8000 feet. Interpretation of the VES data was made by the curve matching method. Depth and resistivity parameters thus obtained were substituted in a computer program and the results were modified, by trial and error, until the calculated apparent resistivity matched the observed one. The results suggest that the maximum depths to fresh-water-bearing sands is about 40 feet in the Dismal Swamp area; it increases eastwards to 130 feet before it diminishes to 40 feet at the Atlantic Coast. To the west of the Dismal Swamp the maximum depth seems to increase progressively westwards from 55 feet at a site immediately to the west of the Swamp to 930 feet at about 50 miles from the Swamp. In the vicinity of the town of Painter on the Eastern Shore, the maximum depth of groundwater aquifers was interpreted to be between 560 and 920 feet. Alternative interpretations are given for 2 sites, in order to stress the idea that the interpretation of resistivity data is not unique.

ENTHALP, A COMPUTER PROGRAM FOR THE CALCULATION OF AQUIFER CHEMISTRY IN HOT-WATER GEOTHERMAL SYSTEMS,
Geological Survey, Menlo Park, Calif. Geologic Div.
A. H. Treusdell.
Available from NTIS, Springfield, Va., 22151 as PB-219 376, Price $4.50 printed copy; $1.45 microfiche. Computer Contribution (USGS-GD-73-006), March 1973. 72 p, 3 tab, 36 ref, 3 append.

Descriptors: *Geothermal studies, *Borehole geophysics, *Thermal water, *Computer programs, *Geochemistry, Water chemistry, Steam, Gases, Aquifer characteristics, Enthalpy, Systems analysis, Wells, Thermal properties, Thermodynamics, Model studies, Analytical techniques, Theoretical analysis.

This program calculates the temperature and chemical conditions in a geothermal aquifer supplying a producing bore. The input includes the enthalpy of the total fluid and the chemical analyses of water and steam separated and collected at known pressures. Alternately if a single water phase exists in the aquifer the complete analyses (including gases) of a sample collected by a downhole sampler are sufficient without a measured value of the total enthalpy. The fundamental assumptions are that the fluid is produced from a single aquifer, and is homogeneous in enthalpy and chemical composition. The calculation, necessarily involving moderately large amounts of auxiliary information and frequent iteration, is well suited to computer methods. (Woodard-USGS)

REGIONAL SPECIFIC YIELD OF THE EDWARDS AND ASSOCIATED LIMESTONES IN THE SAN ANTONIO, TEXAS AREA,
Geological Survey, San Antonio, Tex.
R. W. Maclay, and P. L. Rettman.
Edwards Underground Water District report, August 1973. 10 p, 3 fig, 1 tab, 4 ref.

Descriptors: *Aquifer characteristics, *Specific yield, *Limestones, *Texas, *Groundwater resources, Groundwater movement, Water wells, Water level fluctuations, Hydrographs, Observation wells, Basic data collections.
Identifiers: *San Antonio (Tex), *Edwards aquifer (Tex).

The regional specific yield in the recharge area of the Edwards and associated limestones, the principal aquifer in the San Antonio, Texas, area, is estimated to be about 0.025. This estimate is based on annual differences between recharge and discharge and on the averages of annual water-level changes in 10 observation wells in and near the outcrop area. Illustrations include: map showing recharge and artesian areas of the Edwards and associated limestones; geologic section showing the altitude of the potentiometric surface in January 1961; and hydrographs for observation wells. SOIL DENITRIFICATION IN SEALED SOIL--PLANT SYSTEMS: II. EFFECT OF SOIL WATER CONTENT AND FORM OF APPLIED NITROGEN,
Adelaide Univ. (Australia). Dept. of Agricultural Biochemistry and Soil Science.
R. C. Stefanson.
Plant Soil, Vol 37, No 1, p 129-140, 1972, Illus.
Identifiers: *Denitrification, *Nitrogen, Nitrous oxide, Soil systems, *Soil denitrification, *Soil-water-plant relationships.

The gaseous losses from N applied to the soil were measured in sealed soil-plant systems. In all treatments, large quantities of N2 and N2O were evolved into the atmosphere of the sealed growth chambers, where nitrate-N was applied; the final concentration of N2O and N2 was closely related to soil water content. Plant growth increased the final concentration of N2O and N2 in these chambers. In the presence of plants, the major component of soil denitrification was molecular N whereas in the absence of plants the main product of denitrification was N2O. Application of ammonium-N reduced the losses of soil N as N2O and N2. In ammonium-N-treated soils, the denitrification product was exclusively N, the quantity of which was not related to soil water content. N uptake by plants was low from the higher fertility sample of the Urrbrae red-brown earth, and the plant increased the soil denitrification. The reverse situation was found in the lower fertility soil sample. Some losses of soil N as ammonia nitric oxide and NO2 were found from the soil-plant system. (See also W74-00237 and W74-00025).--Copyright 1973, Biological Abstracts, Inc.
W74-00014

SOIL DENTRIFICATION IN SEALED SOIL--PLANT SYSTEMS: III. EFFECT OF DISTURBED AND UNDISTURBED SOIL SAMPLES,
Adelaide Univ. (Australia). Dept. of Agricultural Biochemistry and Soil Science.
R. C. Stefanson.
Plant Soil. Vol 37, No 1, p 141-149. 1972.
Identifiers: Carbon, *Denitrification, *Nitrogen, Samples, Sealed, Soil systems, *Soil denitrification, *Soil water-plant relationships.

Dentrification was compared in disturbed and undisturbed samples of the Urrbrae red-brown earth placed in sealed growth chambers. With the soil water content at field capacity the losses of N as N2N2O averaged 1-3 mg N/kg soil/wk. This rate was maintained throughout the experimental period of 6 wk and is similar to that occurring in the field. No significant trends were observed in the final concentrations of N2 and N2O resulting from varying the form of applied N, the presence or absence of plants, the disturbance of the soil, or the rotational histories of the sites sampled. However, the combined organic C contents were similar for the A1 and A2 horizons of the soils taken from the old pasture area and continuously cropped area. RELATIONSHIP BETWEEN PROPERTIES AND AGRICULTURAL SUITABILITY OF SOILS: SOIL COMPLEXES: GOOD WHEAT SOILS, VERY GOOD RYE SOILS, GOOD RYE SOILS (IN POLISH),
Instytut Uprawy Nowozenia i Gleboznawstwa, Pulawy (Poland). Laboratorium Anal. Glebowych.
H. Terelak.
Pamiet Pulawski, 48, p 41-71, 1971, Illus, English summary.
Identifiers: *Agricultural soils, Barley, Oats, Rye, Soil, *Soils, Wheat, Crop yield.

Trials were undertaken both to analyze and synthesize the agricultural properties of pseudopodzolic and brown soils developed from loesses, silts, loams and sands, based on the analytical data and description of 4976 profiles of soils belonging to the following soil--agricultural complexes: good wheat soils, very good rye soils and good rye soils. Each soil profile was characterized in regard to: depth of humic horizon, percentage and total humus content, depth of carbonate occurrence, depth of acidification and deacidification, mechanical composition, texture of soil profile, soil-water condition, degree of soil culture and capability class. Based on these features, the basic agricultural properties of the investigated soil complexes were characterized. The relationship between the texture of soil profile and genetic type and the agricultural suitability of soils was determined. The criteria were more strictly defined regarding the division between the good wheat and very good rye complexes, and the good rye and the very good rye in the range of silty soils as well as loamy and sandy soils. Information is also presented regarding the yield of wheat, barley, oats, and rye on the various soil complexes.--Copyright 1973, Biological Abstracts, Inc.

USE OF THE GAMMA FIELD OF THE EARTH TO DETERMINE THE WATER CONTENT OF SOILS,
Gosudarstvennyi Gidrologicheskii Institut, Leningrad (USSR).

N. V. Zotimov.
Soviet Hydrology: Selected Papers, No 4, p 313-320, 1971. 4 fig, 5 tab, 16 ref. Translated from Transactions of State Hydrologic Institute (Trudy GGI), No 189, p 38-48, 1971.

Descriptors: *Soil water, *Moisture content, *Radiation, *Gamma rays, Watersheds (Basins), Bogs, Bulk density, Water storage, Water levels, Instrumentation, Lysimeters, Analytical techniques, Surveys.
Identifiers: USSR.

Field experiments were performed to (1) establish a relation between gamma radiation intensity and soil water content; (2) determine the depth of soil to which this relation can be applied; and (3) develop equipment for surveys of the earth's gamma field to determine average soil water content in catchments. To determine water content at individual stations and during continuous traverse surveying, the relation of natural gamma radiation of the earth to soil water content can be used. The gamma survey method makes it possible to determine water content in soil layers to a depth of approximately 50 cm and to differentiate it by layers within limits of this depth. Under certain climatic and natural conditions, this method can be used to compute water content in the upper 100 cm of soil and in saturated soils. Construction of the relation for a specific catchment requires simultaneous measurement of the gamma field, soil bulk density, and soil water content by the thermostatic-gravimetric method. The error in determining soil water content using this method and fairly simple equipment will not exceed 5%-10%. Use of the gamma survey method to determine soil water content eliminates laborious sampling, drying, and weighing of soil, installation of sensors, and sinking of wells. (Josefson-USGS)

MINERALOGY OF PARENT MATERIALS, TOPSOILS AND EROSION PRODUCTS OF TAITA EXPERIMENTAL STATION,
Department of Scientific and Industrial Research, Lower Hutt (New Zealand). Soil Bureau.
N. Wells, and R. J. Furkert.
N Z J Sci. Vol 15, No 2, p 141-155, 1972.
Identifiers: *Erosion, Materials, *Mineralogy, *New Zeland, Products, Soils, *Topsoils.

Five parent materials from 38 sites on Taita Experimental Station were analyzed for their mineral content by rapid methods. Very strongly weathered greywacke had a low amount of feldspar and a high amount of halloysite. Four deposits of loess had compositions that related to their degree of weathering and to the presence of volcanic ash. The least weathered loess had high amounts of feldspar. Weathering of volcanic ash gave a parent material with high amounts of amorphous minerals together with some gibbsite. Topsoils analyzed from 11 soils mapped on the station had the following mineralogical character: high amounts of quartz, varying amounts of feldspar, halloysite, vermiculite, illite, interlayered hydrous mica, amorphous minerals and organic matter, with traces of gibbsite, montmorillonite, chlorite, and cristobalite. Analysis of 123 topsoil samples showed the degree of variability within the soil mapping units over the 20 ha of the Station. There was little variation in the Pinehaven silt loam form alluvium or Pomare silt loam from colluvium. Larger variations occurred in: Wingate hill soils from loess, Bucks clay loam from loess plus volcanic ash, and Tawai steepland soils from eroded weathered greywacke. The Taita clay loam from weathered greywacke with a minimum of accession varied less in its mineralogical composition than did adjacent mapping units. Erosion products analyzed were: stones from steep slopes, stones from stream beds, sandy deposits from stream beds, and silty deposits from the bottom of ponds. Stones from steep slopes had more illite than stones from streams. Sandy deposits in streams had more quartz and amorphous minerals but less feldspar than stones from streams. The mineralogy of the silty sediments from ponds was related to the nature of land use in the catchment.--Copyright 1973, Biological Abstracts, Inc.

Plant Soil, Vol 37, No 1, p 113-127, 1972, Illus.
Identifiers: *Denitrification, Diffusion, Organic matter, Oxygen, Respiration, Roots, Soils, *Soil denitrification, *Soil-water-plant relationships.

Evolution patterns and constituent components of denitrification were measured in sealed soil-plant systems. In 2 samples of the Urrbrae red-brown earth containing 1.6 and 2.3% organic C, respectively, the growth of the plant consistently increased the amounts of N2O and N2 from the soil at all water contents below field capacity. At soil water contents above field capacity, the total losses of soil N were limited in the pasture soil (organic C 2.3%) by the amount of nitrate substrate and in the crop soil by the lack of easily decomposable soil organic matter. The yields of plant tops were low in these treatments. In the presence of plants, N2 was evolved preferentially, while in their absence N2O accounts for most of the soil N loss. This trend was most pronounced in the crop soil. The pore space relationships measured at the end of the experiments showed that potential O2 diffusion pathways were more restrictive in the crop soil than in the pasture soil. The plant effect on soil denitrification was 2-fold, firstly by increasing the demand for O2 in the soil and secondly by supplying easily decomposable organic matter. INFILTRATION PROPERTIES OF SOILS AND INTRAZONAL STRUCTURE OF THE HYDROLOGIC BUDGET (INFIL'TRATSIONNYYE SVOYSTVA POCHV I VNUTRIZONAL'NYYE OSOBENNOSTI STRUKTURY VODNOGO BALANSA),
A. M. Grin.
Vsesoyuznoye Geograficheskoye Obshchestvo Izvestiya, Vol 103, No 5, p 463-469, September-October 1971. 5 fig, 15 ref.

Descriptors: *Infiltration, *Hydrologic budget, *Soil properties, Hydrologic properties, Permeability, Soil moisture, Soil types, Rainfall-runoff relationships, Runoff coefficient, Land use, Correlation analysis, Equations.
Identifiers: *European USSR.

The hydrologic budget of a land-use class is affected by soil physical and chemical properties, which determine the capacity of a soil to absorb, transmit, and retain water. To describe the infiltration capacity of different soils in various uses, investigations were carried out in 1962-70 in forest steppe, steppe, and southern forest zones of European Russia. An empirical relation was established between infiltration capacity of soil and surface-runoff and total-moisture values of an area. Quantitatively determined relations between soil hydrophysical properties and relation of major items in the hydrologic budget of a particular land-use class can be used in routine hydrologic forecasting and in formulating a genetic theory of river runoff formation. THE EFFECT OF DENSITY ON WATER RETENTION PROPERTIES OF FIELD SOILS,
Soil Survey of England and Wales.
M. J. Reeve, P. D. Smith, and A. J. Thomasson.
Journal of Soil Science, Vol 24, No 3, p 355-367, September 1973. 3 fig, 6 tab, 23 ref.

Descriptors: *Bulk density, *Available water, *Retention, Clays, Soil structure, Soil management, Field capacity, Soil physical properties, Hydrologic properties, Soil texture.
Identifiers: Water retention.

The bulk density, available water, air capacity, and retained water capacity were determined for A, B, and C horizons of 158 field soils, clay, and silt. Statistical analysis of the results demonstrated that bulk density exerts a profound influence on available water, air capacity, and retained water capacity, but the effect varies between texture groups and horizons. Significant negative correlations were obtained between bulk density and air capacity for most texture and horizon groups. In B and C horizons available water and retained water capacity also decrease with increasing density, whereas in A horizons they tend to increase with bulk density. Within a limited range it is feasible to control these soil characteristics by using field techniques to achieve optimum bulk density. (Knapp-USGS)

OBSERVATIONS ON THE SOIL-WATER REGIMES IN A DRAINED CLAY SOIL,
Ministry of Agriculture, Fisheries and Food, Cambridge (England). Field Drainage Experiment Unit.
B. D. Trafford, and D. W. Rycroft.
Journal of Soil Science, Vol 24, No 3, p 380-391, September 1973. 6 fig, 2 tab, 17 ref.

Descriptors: *Drainage, *Clays, *Mole drainage, *Deep tillage, Drainage practices, Soil water movement, Percolation, Chiselling, Soil management.
Identifiers: England.

Soil-water profiles between drains and the associated drain-flow data were measured for the winter period on a clay soil of the Ragdale series, formed in drift over Lias clay in the Midlands of England. A water table exists and the rate of drain flow depends on whether the water table is high enough to be within layers having a better hydraulic conductivity than the normal subsoil. Mole drainage modifies the drainage performance considerably by providing a quicker disposal of water and significantly lower water table subject to much smaller fluctuations in level. Where drains are laid in the natural subsoil, without this being disturbed by deep cultivations, the water-table level is frequently close to cultivation level and there appears to be little water movement in the subsoil. For effective drainage, soils of this type require deep cultivation to modify the subsoil and allow water movement at greater depth. (Knapp-USGS)

SOME ASPECTS OF THE HYDRODYNAMIC DISPERSION OF SOLUTES IN POROUS MATERIALS,
Rothamsted Experimental Station, Harpenden (England).
D. A. Rose.
Journal of Soil Science, Vol 24, No 3, p 284-295, September 1973. 2 fig, 17 ref.

Descriptors: *Dispersion, *Soil water movement, *Groundwater movement, Porous media, Solutes, Leaching, Path of pollutants, Saturated flow, Mixing.
Identifiers: Hydrodynamic dispersion.

Several methods are given for analyzing the breakthrough curve of one solution as it displaces another from a column of porous material to yield a coefficient of hydrodynamic dispersion. The form of K is a function of particle size and fluid velocity in granular beds composed of solid particles or of aggregates. The effect of K on the dispersion osbserved in a column of porous material, as fluid velocity and particle size vary, may be used as an aid in assessing the efficiency of leaching. uantitative aspects of the hydrodynamic dispersion of solute which occurs under the combined influence of convection and molecular diffusion when a solution flows through a porous medium are reviewed. Solute is dispersed longitudinally relative to a plane moving with the mean velocity of flow with an apparent diffusion coefficient K termed the coefficient of hydrodynamic dispersion. The medium is considered to be a uniform bed of uniform particle size at a uniform water content. The analysis of breakthrough curves to estimate the dispersion coefficient, which treats K as a constant, is general and thus applies to both saturated and unsaturated media. (Knapp-USGS)

MODIFIED APPROACH TO CAPILLARY HYSTERESIS BASED ON A SIMILARITY HYPOTHESIS,
Technion-Israel Inst. of Tech., Haifa. Dept. of Civil Engineering.
Y. Mualem.
Water Resources Research, Vol 9, No 5, p 1324-1331, October 1973. 8 fig, 23 ref. USDA FG-IS-287.

Descriptors: *Unsaturated flow, *Capillary action, *Hysteresis, Soil water movement, Wetting, Drying, Capillary conductivity, Pores.
Identifiers: Capillary hysteresis.

A simplified approach to the capillary hysteresis phenomenon is based on a similarity hypothesis. A simple method predicts the relationships between the capillary head and the water content within the hysteretic loop. Only the boundary curves of the main loop are required in order to derive analytically the scanning curves. The realiability of the proposed model is demonstrated by a comparison of the predicted scanning curves with measured ones. The computed results are often in more satisfactory agreement with experiments than those obtained with the use of the general Neel-Everett model. (Knapp-USGS)

ANALYSIS OF COUPLED HEAT-FLUID TRANSPORT IN PARTIALLY FROZEN SOIL,
Department of the Environment, Ottawa (Ontario). Water Resources Branch.
R. L. Harlan.
Water Resources Research, Vol 9, No 5, p 1314-1323, October 1973. 5 fig, 30 ref.

Descriptors: *Soil water movement, *Heat flow, *Frozen soils, Freezing, Thawing, Mass transfer, Temperature, Numerical analysis, Equations, Infiltration, Frost, Frozen ground, Ice.

An analogy can be made between the mechanisms of water transport in partially frozen soils and those in unsaturated soils. By use of this analogy a Darcian approach may be applied to the analysis of coupled heat-fluid transport in porous media with freezing and thawing. With the aid of a numerical model, freezing-affected soil-water redistribution and infiltration to frozen soil were examined from a phenomenological point of view, and the effects of soil type and initial conditions on the response of a hypothetical soil column were studied. In general, the model shows that the rate of upward redistribution of soil water to a freezing zone at the soil surface decreases from coarse-textured soils to fine-textured soils and decreases with increase in depth to the water table. Subsequent redistribution during melting of the frost wedge occurs at a rate less than that associated with freezing. Infiltration to partially frozen soil has a significant influence on soil-water redistribution and the response of the groundwater table. (Knapp-USGS)

A METHOD FOR DETERMINING THE BEHAVIOR OF LONG WAVES CLIMBING A SLOPING BEACH,
North Carolina State Univ., Raleigh Dept. of Civil Engineering.
M. Amein.
Journal of Geophysical Research, Vol 71, No 2, p 401-410, January 15, 1966. 7 fig, 21 ref. NBy-32236

Descriptors: *Beaches, *Coasts, Tsunamis, Shallow water, Waves (Water), Computer programs.
Identifiers: *Long waves, *Beach slopes, *Near shore processes, Explosion waves, Wave runup.

The motion of periodic long waves in shoaling water and their climb on a sloping beach are determined. One objective was the development of a method which might be useful in the investigation of tsunamis and explosion waves in coastal waters. Results are given for waves with periods ranging from 20 to 200 sec and for beach slopes ranging from 0.05 to 0.10. The propagation of long-period waves is determined by the first-order linear small-amplitude surface wave theory for regions away from the shore and by the first-order nonlinear shallow-water theory for regions near the shore. Calculations by the linear theory were made by using Friedrichs' second asymptotic representation, which is suitable for small beach slopes. Calculations by the nonlinear theory were made on a digital computer by a finite difference technique based on the method of characteristics. In the numerical method, the bre equations are coupled to the equations of the nonlinear theory, and a procedure for the calculation of the wave runup on the dry sloping beach is given. A primary objective was the development of computer programs for the application of the nonlinear theory to periodic long waves. Instantaneous dimensionless wave profiles as functions of the distance from the shore are presented for several combinations of wave periods and beach slopes. (Sinha-OEIS)

Identifiers: Gulf of Maine, *Coastal processes, Clupea harengus, *Near shore processes, *Wind effects, *Dynamic pressure gradients, *Shoreline configuration, Surface circulation, Coastal topography, Bottom topography.

Coastal currents during 1962-65 are described for an area extending from the headlands to 28 km offshore and from Cape Ann, Massachusetts (42 deg 39 min N, 70 deg 35 min W), to Machias Bay, Maine (44 deg 40 min N, 67 deg 20 min W). Recoveries of drift bottles confirm the major features of the surface circulation described previously by other authors. Recoveries of sea-bed drifters suggested movement of water shoreward, as well as into bays and estuaries; and along the coast for varying distances. Upwelling is the most prominent feature of the coastal circulation. Exceptions occurred at times when, (1) surface water moved inshore along a dynamic gradient within the eastern sector of the coast, (2) winds, dynamic topography at the surface, and bottom topography directed surface drift shoreward within the central and western portions of the coast, and (3) bottom water moved parallel with the coast. PROBABILITIES OF WAVE CHARACTERISTICS IN THE SURF ZONE,
Tetra Tech, Inc., Pasadena, Calif.
J. I. Collins, and W. Wier.
Available from the National Technical Information Service as AD-696 140, $6.00 in paper copy, $1.45 in microfiche. Report No. TT-TC-149-1, September 1969. 124 p, 23 fig, 24 ref, 3 append. ONR N00014-69-C-0107.

Descriptors: *Coasts, Shallow water, Hydrodynamics, Ocean waves, Mathematical models, Computer programs, Refraction, Waves (Water).
Identifiers: Littoral zone, *Surf zone, *Near shore processes, *Longshore currents, Energy flux, *Coastal processes, Probability distributions, Coastal topography, *Shoreline configuration.

Utilizing the hydrodynamic relationships for shoaling and refraction of waves approaching a shoreline over parallel bottom contours, a number of probability distributions for breaking wave characteristics are derived in terms of assumed deep water probability densities of wave heights, wave lengths and angles of approach. Some probability densities for wave heights at specific locations in the surf zone are computed for a Rayleigh distribution in deep water. The probability computations are used to derive the expectation of energy flux at various locations in the surf zone. A further application to determine longshore current expectation is proposed. (Sinha-OEIS)
W74-00018

THEORETICAL AND EXPERIMENTAL STUDY OF WAVE ENHANCEMENT AND RUNUP ON UNIFORMLY SLOPING IMPERMEABLE BEACHES,
Scripps Institution of Oceanography, La Jolla, Calif.
W. G. Van Dorn.
Available from the National Technical Information Service as AD-636 225, $3.00 in paper copy, $1.45 in microfiche. Report No SIO-66-11, May 1966. 101 p, 15 fig, 26 ref, 4 append, 6 infolds. NONR 2216 (16).

Descriptors: Beaches, Coasts, *Waves (Water), Shores, *Shore protection.
Identifiers: *Near shore processes, *Coastal processes, *Beach slope, Incident waves, *Dispersive wave trains, Wave profile, *Wave runup prediction, Beach slope, *Shoaling water, *Wave propagation, Wave enhancement.

The shoaling enhancement of small-amplitude, dispersive wave trains traveling over uniform, impermeable slopes was observed in a specially-constructed wave channel, where the reproducible wave elevation measurement accuracy was about 0.0005 in. These observations substantially support the enhancement predicted from linear theory (conservation of energy flux) except in very shallow water and on very steep slopes, where accelerative effects become important. On the hypothesis that small-amplitude runup theory might be similarly valid for periodic waves of finite height, provided that the positive incident wave amplitude is replaced by the local crest height above still water, this theory was modified to include the effect of the superrelevation under a wave crest due to profile asymmetry. The modified theory is shown to agree acceptably with runup observations of larger waves previously reported-both for breaking and nonbreaking waves. Because solutions to the modified theory cannot conveniently be obtained by manual calculation, a nomograph chart is included, from which runup predictions can be easily made, given only the wave height, period, and water depth a wavelength or so from shore, and the beach slope. Use of this nomograph for non-wave-length or so from shore, and the beach slope. Use of this nomograph for non-uniform slopes, oblique incidence, and non-periodic waves is also discussed. CHARACTERISTICS OF WAVE RECORDS IN THE COASTAL ZONE,
Army Coastal Engineering Research Center, Washington, D.C.
D. L. Harris.
In: Waves on Beaches and Resulting Sediment Transport, Academic Press, p 1-51, 1972. 19 fig, 6 tab, 28 ref. Also as U.S. Army CERC Reprint 2-73.

Descriptors: *Coasts, *Beaches, *Ocean waves, *Pressure measuring instruments, *Aerial photography.
Identifiers: *Wave measuring instruments, *Wave spectra, *Surface waves, Pt. Mugu (Calif), Power spectra, *Multinodal spectra, *Near shore processes, *Coastal processes.

Records from several types of wave gages are compared to obtain a measure of instrumental reliability. Pressure records may give a better measure of surface waves than some gages which record the surface elevation directly. Spectra computed from the records of a five-gage array of pressure gages at Pt. Mugu, California, show that the true spectra consist of a group of narrow spikes, and not a smooth continuous function of frequency. Data from Pt. Mugu and several east coast stations show that multinodal spectra are common. Frequency of maximum energy density in the pressure spectra is different from surface spectra or the velocity spectra. Photographs of waves from space are used to show that long crested waves with no more than slight variation in direction do occur in the ocean. Aerial photography of a coastal region is used to show that wave conditions can vary significantly within short distances in the coastal region. (Sinha-OEIS)

SEASONAL VARIATIONS IN SELECTED PHYSICOCHEMICAL CONDITIONS OF A SMALL LAKE IN BRAZOS COUNTY, TEXAS,
Texas Water Quality Board, Austin.
R. O. Respess, C. E. Wood, J. M. Inglis, and W. J. Clark.
Southwest Nat. Vol 17, No 3, p 249-263, 1972. Illus.
Identifiers: Lakes, Light, Physicochemical analysis, *Seasonal, Small lakes, Temperature, *Texas (Brazos County), *Dissolved oxygen, *Turbidity.

Weekly physicochemical analyses, including water temperature, dissolved O2, CO2, pH, total alkalinity, turbidity, and light transmittance were made for a 1-yr period in a lake of 0.76 ha. Dissolved O2 and temperature profiles and surface samples for chemical analysis were taken at each of seven stations. Midwater (1.5 m) and deep samples (2.7 m) for chemical analysis were taken at the 3 deepest stations. Thermal stratification persisted for about seven months of the year, and the lake was completely mixed for about 2.5 mo in winter. Below 1.8 m depth dissolved O2 was less than 1 mg/l for about 4 mo. in summer. CO2 was present in greater concentrations than has been reported for most other freshwater ponds and lakes, and the total alkalinity and pH were lower than those commonly reported. Turbidity was high and the light transmittance was influenced accordingly. Turbidity and dissolved O2 seemed to have had the most influence on the capability of the lake to support a diversified aquatic community.--Copyright 1973, Biological Abstracts, Inc.

QUALITATIVE AND QUANTITATIVE VARIATION OF NET PLANKTON OF CRAIGHEAD LAKE,
Oklahoma State Univ., Stillwater. Dept. of Entomology.
J. H. Nelson, and G. L. Harp.
Southwest Nat. Vol 17, No 3, p 239-248, 1972. Illus.
Identifiers: *Arkansas (Craighead Lake), Ceratium, Diaptomus, Difflugia, Distribution, Keratella, Lakes, *Plankton, Qualitative, Quantitative, Soft water.

This study describes the horizontal, vertical, and seasonal variation qualitatively and quantitatively of net plankton in Craighead Lake (Arkansas) and the co-existing physicochemical characteristics.

Further, this formation is compared qualitatively with the results obtained by Barton (1963) concerning the same lake. Craighead Lake is a soft water lake with generally adequate O2 values throughout the year, maintaining a fairly constant CO2 level and neutral pH in the upper strata. The lake is biologically poor and the 55 genera of net plankton identified constituted a mean annual standing crop of only 710 organisms/l. Total organisms varied numerically from 168/l to 2254/l on 4 Jan. and 26 April 1969, respectively. Difflugia, Ceratium, Diaptomus, and Keratella were the dominant genera, in that order. Vertical distribution of plankton was generally characterized by fewer taxa and greater numbers/l with increased depth. The most striking change in net plankton since 1962-63 was in the composition of the dominant forms. This change, and the overall paucity of plankton organisms in the present study, is largely attributed to the softness of the water and the enlargement of the lake in 1962 by extensive dredging.--Copyright 1973, Biological Abstracts, Inc.

DISTRIBUTION OF PEAT BOGS ON EARTH, THEIR TYPES AND CHARACTERISTICS, (IN RUSSIAN),
N. Ya. Kats.
Bot Zh. Vol 57, No 2, p 198-210. 1972. Illus. English summary.
Identifiers: *Bogs (Distribution), Eurasia, Eutrophy, Flowering, North America, *Oligotrophy, *Peat bogs, Plants, Scheuchzeria, Scirpus-Caespitosus, *Sphagnum.

In temperate zones of Eurasia and North America change of peat bog types from West to East is observed. In both regions, these types are similar in some features, being distinguished from peat bogs of central parts of the continents (meridional, or West-East symmetry). Similarities are revealed in the following: on plains, peat bogs occupy great area and have thick layer of peat; oligotrophic peats are typical, they often prevail over eutrophic ones; Scheuchzeria, Scirpus caespitosus and Sphagnum, forming the basis of peat bogs, are characteristic for the vegetational cover. In coastal territories (England, Ireland and others) on blanket bogs (as well as in peat) flowering plants are abundant instead of Sphagnum. Peat bogs of temperate zones in the Northern and Southern hemispheres have similarities as well (latitude, or North-South symmetry). They are: raised surface; prevalence of Sphagnum, partly of common species, in vegetation and in peat and 3 sharp distinction in species composition of flowering plants. Symmetry of Northern and equatorial oligotrophic peat bogs (Zund Islands) is seen in following: raised surface; belt-like disposition of vegetation; very acidic peat; furrows draining central parts of bogs and taking water to the outlying ones. There is nothing common in flora. Features of symmetry in cold-temperate and warm-termperate zones (th Caucasus) of the Northern hemisphere are: raised surface; thick acidic Sphagnum-peat; common species of Sphagnum and some flowering plants.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: *USSR (Lake Sarychelek).

Hydrological and meteorological observations were carried out in 1964-65 on Lake Sarychelek, the third deepest lake in Soviet Central Asia. According to latest figures, the morphometric parameters of the lake are: length--7.5 km; maximum width at the dam--2,280 m; mean width--650 m; surface area--4.92 sq km; maximum depth--234 m; volume--0.483 cu km; and mean depth--98 m. The annual range of water levels in the lake during the period of observations was 43 cm. At the end of April after ice breakup, the water surface temperature approaches 0 deg C. Maximum water surface temperature at the shore (19.8 deg C) was recorded on August 25, 1965. Annual temperature cycle in the lake extends to a depth of about 30 m. A year-round inverse temperature structure is observed below 30 m. The temperature of water at the bottom of the lake is about 5 deg C. (Josefson-USGS)

Descriptors: *Lakes, *Water balance, Inflow, Discharge (Water), Precipitation (Atmospheric), Evaporation, Water levels, Water types, Water resources, Dams.
Identifiers: *USSR (Lake Balkhash), Ili River.

Owing to unfavorable natural trends in water resources development and removal of part of the Ili River runoff for economic purposes, the water regime of Lake Balkhash is acquiring properties that are highly detrimental to branches of the national economy which depend on the lake waters. From the State point of view, this situation must be remedied. One solution is to divide the lake into three pools separated by two dams: the Western Balkhash and Lepsa-Karatal (Eastern Balkhash) freshwater pools; and the Central or Algazy salinewater pool, which will receive the surplus water of the other two pools. Water-balance computations fully justify such reconstruction and conservation of Lake Balkhash as a major water body. (Josefson-USGS)

THE DYNAMICS OF A GROUP OF PERCHES, PERCA FLAVESCENS (MITCHILL) IN THE GRANDE-ANSE COVE OF PERROT ISLAND IN SAINT-LOUIS LAKE, (IN FRENCH),
Montreal Univ. (Quebec). Dept. of Biological Sciences.
R. Fortin, and E. Magnin.
Nat Can (Que). Vol 99, No 4, p 367-380. 1972. Illus. (English summary).
Identifiers: *Canada (Saint Louis Lake), Coves, Islands, Lakes, Perca-Flavescens, *Perches, Tagging, Spawning.

In 1968 and 1969, 9396 perches were tagged on their spawning grounds in Grande-Anse of Ile Perrot, Canada. To date, 378 specimens were recaptured by anglers and 63 by biologists. Mean distances from the release point are small: 1.9 km under the ice and 3.9 km in open waters: this demonstrates the sedentary character of these fish. The number of eggs varied from 8000-29,000 for females measuring 190-300 mm. The annual rate of survival (s) for fish of age group VI and older was 54%. The rate of catch per angler and per hour was 0.5 perch during the winter and 4.2 perches in open waters. The annual rate of exploitation was 3.4%. The population density for fishes measuring 190 mm and more was estimated as being 268,000 individuals; the corresponding biomass for Grande-Anse is 21.4 kg/ha. The yield per 1000 g of recruits measuring 161 mm (2 and 1/3 yr old) was 124 g.--Copyright 1973, Biological Abstracts, Inc.

HYDROBIOLOGICAL INVESTIGATION OF LAKE LERE AND NEIGHBORING PONDS: I. THE PHYSICAL ENVIRONMENT, (IN FRENCH),
Office de la Recherche Scientifique et Technique Outre-Mer, Fort Lamy (Chad).
C. Leveque.
Cah ORSTOM (Off Rech Sci Tech Outre-Mer) Ser Hydrobiol. Vol 5, No 2, p 161-169. Illus. 1971. English summary.
Identifiers: Biomass, *Chad (Lake Lere), Environment, *Hydrobiological studies, Invertebrates, Lakes, Ponds, *Rotifera.

A limnological investigation of Lake Lere (Chad) (9 deg 37 min N-14 deg 10 min E) was made in Feb. 1970. The bathymetric study shows that this lake is shallow (6m), with flat bottom and can be classsified as a flat tropical lake. Ca is the abundant salt in the water, but the general salt content is low (conductivity: 89 micro mhos). The bottom is homogeneous and essentially muddy. At the time of the study, Rotifera were the main zooplankton. Other invertebrates and the benthic biomass are analyzed. --Copyright 1973, Biological Abstracts, Inc. (See also W74-00502)

HYDROBIOLOGICAL INVESTIGATION OF LAKE LERE (CHAD) AND NEARBY PONDS: IV. THE BENTHIC FAUNA,
Office de la Recherche Scientifique et Technique Outre-Mer, Fort Lamay (Chad).
C. Dejoux, L. Lauzanne, and C. Leveque.
Cah ORSTOM (Off Rech Sci Tech Outre-Mer) Ser Hydrobiol. Vol 5, No 2, p 179-188. Illus. 1971.
Identifiers: *Alluroides, *Bellamya-Unicolor, *Benthic Fauna, *Chad (Lake Lere), Ephemeroptera, Hydrobiological studies, Lakes, Ponds, Trichoptera.

Lake Lere is characterized by a lack of benthic endemics, which is to be expected considering that it marks an area of transition from the Chad to the Niger Basins. However, Lake Lere had fewer species than Lake Chad. Particulary evident is the absence of Ephemeroptera and Trichoptera, Alluroides worms, and Bellamya unicolor mollusks. Considering the small number of benthic species and the homogeneity of the environment (sediment, physicochemistry of the water), Lake Lere constitutes a much more simple aquatic ecosystem than Lake Chad.--Copyright 1973, Biological Abstracts, Inc. ECOLOGICAL AND FLORISTIC CONVERGENCES BETWEEN SEASONAL PLANT FORMATIONS OF TROPICAL AND SUBTROPICAL SOUTH AMERICA,
Universidad de Los Andes, Merida (Venezuela). Facultad de Ciencias.
G. Sarmiento.
J Ecol. Vol 60, No 2, p 367-410, 1972. Illus.
Identifiers: Canopy, Diversity, Ecological studies, Floristic studies, Generic composition, Layering, Morphology, Rainfall, *Seasonal, *South America, Subtropical, Taxa, *Tropical, Woody plants.

Four tropical seasonal formations of the Caribbean area of northern South America were compared with 9 seasonal subtropical types occurring in southern South America. Considered were: number of woody families and genera; generic composition; floristic elements; generic diversity; layering; leaf size and leaf type of canopy layer species; number of woody genera with thorny, succulent and aphyllous representatives; mean annual rainfall and number of dry months. The tropical American formations are floristically richer than their equivalent subtropical types; alpha-diversity decreases toward the arid extremes of each series, but in a more irregular way in the subtropical group. Tropical elements predominate in the less seasonal types of both series, whereas the most seasonal formations have a more heterogeneous flora from the distributional viewpoint. A 2-axis ordination of the 13 types is given, showing the relative floristic affinity between them. The Gallery forest of the Parana-Paraguay rivers is the subtropical type closely related to the tropical seasonal formations. Subtropical units are lower and structurally simpler than tropical types occurring under equivalent climate. Each subtropical formation compares best with a more seasonal tropical type. In the subtropical area, the mixed character of leaf type is more evident when only the dominant species in each formation are considered. Subtropical types have significantly smaller leaf sizes, while the proportion of taxa showing xeromorphic features is greater than in the Caribbean types. The group of seasonal formations in the subtropical area varies irregularly, probably due to the combined action of the 2 main environmental stresses: drought and cold.--Copyright 1973, Biological Abstracts, Inc.

SYNOPSIS ON THE BIOLOGY OF THE SHRIMP OF RIO DEL NORTHE (CHILE), (IN SPANISH),
Chile Univ., Santiago. Departamento de Biologia.
N. Bahamonde, and I. Vila.
Biol Pesq (Chile). 5. p 3-59. 1972. Illus. (English summary).
Identifiers: Biology, *Chile (Rio-Del-Norte), *Shrimp, Synopsis.

A synthesis of the data known about the shrimp of the Northern rivers (Cryphiops caementarius Molina) the only representative of the Palaemonidae family, which can be found in Chile is given. The area of dispersion lies between the river Maipo, Chile, towards the South and the Peruvian spas of the central Southern regions. During the day, the shrimp stays in the deepest parts of the river, either among or under the stones, or it seeks hiding places among the aquatic plants. At dusk, the shrimp increases its activity, moving to shallow places in search of food. It is omnivorous and in a gastric analysis, different remains of Clorophyceae, Cyanophyceae, diatoms, Gastropoda, Mollusca, larvae, Coleoptera and copepod Cyclopoidea were found. Some specimens have reached a cephalothoracic length of 57 mm. (Limari River); the minimal size for females in spawing is 7.2 mm. in the Estero El Culebron; and 14.3 mm. in river Limari; both sizes are bigger than the specimens observed in Peru. The diameter of the eggs varies from 0.54-0.84 mm. The principal area of birth is generally near the river's mouth. The period of spawning goes from Sept. to May, with higher percentages in Dec., Jan. and Feb. There are some variations according to the hydrographic system that was analyzed. The methods of catching, culture, and fishing control are discussed. The relation between size and weight, sexual dimorphism and composition of the populations studied in the river Limari and stream El Culebron, in Chile is indicated.--Copyright 1973, Biological Abstracts, Inc.

WATER CONTENT IN A PHYTOCOENOSIS, AND WATER BUDGET OF A ECOSYSTEM; OAK-FOREST OF VIRELLES, (IN FRENCH),
Brussels Univ. (Belgium). Laboratoire de Botanique Sysetematique et d'Ecologie.
G. Schnock.
Oecol Plant. Vol 7, No 3, p 205-226. 1972. Illus. (English summary).
Identifiers: *Belgium (Virelles), Drought, Ecosystem, Forests, *Oak forest, *Phytocenosis, Seasonal rhythm, *Water budget.

During the vegetative period, the moisture content of trees decreases during the warm daytime and increases during the nighttime. Besides the daily rhythm, there exists a seasonal rhythm closely related to the tree physiology, successively: important and generalized increment of the moisture content during the buds swelling period; decline, at first rapid, during the foliation stage, afterward slower until the end of the vegetative period; rehydration of trunks and limbs during the coloration and defoliation stage; relatively stable and homogeneous moisture content in all tree parts in winter season. Moisture and drought periods can induce temporary fluctuations of the moisture content of trees. The more the organs are young and functional, the more the water content is high and the more the fluctuations are important. During the whole vegetative period, the water content of the forest of tall trees has increased from 9.7 to 10.5 mm; it is running to 11 mm for the phytocenose (Wp ± community water content) and delta Wp reaches + 1.8 mm (leafy stage) and--0.6 mm (leafless stage).--Copyright 1973, Biological Abstracts, Inc.
W74-00474

THE EVOLUTION OF A DISCRETE BEAVER HABITAT IN THE MACKENZIE RIVER DELTA, NORTHWEST TERRITORIES,
Alberta Univ., Edmonton. Dept. of Geography.
D. Gill.
Can Field Nat. Vol 86, No 3, p 233-239. 1972. Illus.
Identifiers: *Beaver habitats, *Canada (N.W.T., Mackenzie River), Castor-Canadensis, *Deltas, Evolution, Populus-Balsamifera, Rivers, Seral community.

The in situ sequence of physical and biological events that creates a discrete beaver (Castor canadensis kuhl) habitat in the Mackenzie River Delta is traced through time. Fluvial and sedimentation processes along a shifting channel create an environment that is conducive to the colonization of a poplar (Populus balsamifera) seral community. Depressions formed immediately inland from such sites may be colonized by beavers, after which they are adjacent to a large and preferred food source. Selective use by beavers may locally alter the flora to maintain a zootic climax until the site is abandoned. After abandonment, poplar regeneration may once again attract beavers so that a cyclic pattern of use is established.--Copyright 1973, Biological Abstracts, Inc.
W74-00481

COMPARATIVE CHARACTERISTICS OF ECOLOGICAL CONDITIONS IN ANNUAL CLEARING AND UNDER A CANOPY IN DRY COTINUS OAK WOODS, (IN RUSSIAN),
A. I. Vainshtein.
Izv Akad Nauk Mold SSR Ser Biol Khim Nauk. 2. p 9-15. 1972. Illus.
Identifiers: Annual, Canopy, Clearing, *Cotinus, Ecological studies, Evaporation, Light, Moisture, *Oak, *Quercus-Petraea, Soils, Temperature, Transpiration,.

Under conditions of dry Cotinus oak woods of Quercus petraea Liebl., as in fresh types, removal of wood leads to a change in the microclimate of the clearing. However, as a result of thinning of the leaf canopy in sub-crown area, dry conditions are introduced, thus reducing the contrast of microclimatic indices in the woods and in the clearing. In the woods, at noon, an average 63% of the total short-wave radiation and 56% of light energy passes into the clearing through the tree canopy after the vegetation season. The largest difference between temperature indices in the woods and in the clearing is observed in hours of maximum heating. Air is heated on the forest floor, and soil to a depth of 5 cm. Indices of water regime under the forest canopy and in the clearing differ in the course of a whole season; however, this difference varies depending on transpiration of the stand and underbrush, in the surface layers also on physical evaporation, and also on summer deposits. Over the course of the entire vegetation season, the soil layer is parched under the forest canopy at a depth of 100-160 cm, i.e., in the main zone of concentration of root systems of trees and underbrush.--Copyright 1973, Biological Abstracts, Inc.

LITTER DECOMPOSITION IN THE EVERGREEN RAIN-FOREST OF IVORY COAST, (IN FRENCH),
Office de la Recherche Scientifique et Technique Outre-Mer, Abidjan (Ivory Coast).
F. Bernhard-Reversat.
Oecol Plant. Vol 7, No 3, p 279-300. 1972. Illus. (English summary).
Identifiers: Arthropods, Calcium, Decomposition, *Evergreen rain forest, *Ivory Coast, *Litter decomposition, Magnesium, Microbial activity, Phosphorus, Potassium, Rain.

Litter break down was studied in a rain forest of south Ivory Coast at 2 sites: a plateau and a talweg. Litter disappeared within 5 mo. in the talweg;

on the plateau, the time for total disappearance was about 9 mo. The curves of amount remaining versus time are different from the exponential theorical ones. Analyses showed mineral nutrient losses from the litter. The order of decreasing mobility was K, P ± Mg and Ca. The role of some factors was studied. Decomposition rate is greatly dependent on plant species. Mineral nutrient content of leaves was less important than site. The site is an important factor in litter decay; this is partly due to the top soil features and its microflora. Microbial activity in litter is independent on leaf age, the respiration rate is high in freshly fallen leaves, and then decreases greatly. Artificial leaching of the litter showed a rapid loss of the nutrients used by microflora. Litter arthropod number is maximum during the wet season; the role of arthropods in litter decay is variable and difficult to study.--Copyright 1973, Biological Abstracts, Inc.

STUDIES ON THE BIOLOGY AND CONTROL OF VAUCHERIA DICHOTOMA FOUND IN FRESHWATERS IN BRITAIN,
Ain Shams Univ., Cairo (Egypt). Faculty of Education.
A. R. Dowidar, and T. O. Robson.
Weed Res. Vol 12, No 3, p 221-228, 1972, Illus.
Identifiers: Chlorophyll, Diquat, Growth, Herbicides, Nutrients, Reproduction, *Vaucheria-Dichotoma, *Algae, *Great Britain (Oxford).

V. dichotoma Ag. plants were collected from a ditch near Crowland and from the River Cherwell at Oxford (England). A nutrient medium is described which allows the growth and sexual reproduction of this alga. Preliminary studies on the control with diquat show that it must be exposed to a concentration of 2 mg/l for 6 hr for the herbicide to be effective. The presence of mud reduces the rate at which chlorophyll disintegrates and hastens the inactivation of diquat.--Copyright 1973, Biological Abstracts, Inc.

2J. Erosion and Sedimentation

DOUBLE-HUMPED WAVES ON A SLOPING BEACH,
Hawaii Inst. of Geophysics, Honolulu.
J. P. Butler.
Report HIG-67-16, August 1967. 29 p, 6 fig, 5 ref. Also as ESSA-JTRE-2.

Descriptors: *Waves (Water), *Beaches, *Erosion, *Deposition (Sediments), *Shallow water.
Identifiers: *Wave action, *Beach slope, Wave propagation.

The nonlinear shallow water theory in two dimensions has been used to compute the behavior of selected wave shapes on sloping beaches. These waves all are initially at rest with two humps of specified heights. An analytic solution is found for the behavior of the wave height and velocity at the shoreline. Particularly interesting are the amplifications of the respective humps, when related to the wave shape. Numerical techniques are used to find the general behavior of the wave off the shoreline. (Sinha-OEIS)

A TIME SERIES FROM THE BEACH ENVIRONMENT,
Atlantic Oceanographic and Meteorological Labs., Miami, Fla.
W. Harrison, E. W. Rayfield, J. D. Boon, III, G. Reynolds, and J. B. Grant.
Technical Memorandum ERLTM-AOL-1, January 1968. 28 p, 4 fig, 4 tab, 14 ref, 9 plates, 3 append.

Descriptors: *Beaches, *Time series analysis, *Waves (Water), Rainfall, Water temperature, Air temperature, Winds, Sands, *Sediment transport, Virginia.
Identifiers: Virginia Beach, *Coastal processes, *Near shore processes, Radiant energy, Wind speed, Longshore currents, Breakers, Bottom topography.

A continuous, 26-day series of measurements of the following variables was made at Virginia Beach, Virginia, during August and September, 1966: depth of the water table in the foreshore, altitude of the foreshore surface, tidal elevation, angle between breaker crest and shoreline, height of breaking waves, period of breaking waves, rainfall, radiant energy balance over water, water temperature, air temperature, wind speed, wind direction, velocity of longshore current, position of the top of the uprush, position of the inshore margin of the breaker zone, and the height and period of significant waves 240 m offshore. Water and sand samples were also collected. Additional measurements derived from the samples or field data consisted of: significant breaker height, foreshore slope, quantity of foreshore sand eroded or deposited in one tidal cycle, mean time for sand samples to fall 1.0 m in fresh water, nominal grain diameter and sorting coefficient of foreshore samples, length of unsaturated foreshore surface from outcrop of water table to swash reach, length of saturated foreshore surface from water table outcrop to trough in front of breaking wave, elevation of water table outcrop above trough level at breaking, rate of rise or fall of the tidal plane, density of the sea water, and relative density of midforeshore sand grains. Most of the variables were measured every 4 hr; a few were measured every 6.25 hr, at times of high or low water, and three variables were measured continuously. Plots of the variables were prepared, smooth curves drawn, and the curves digitized using 1-hr interval. A listing of the basic time series is presented, together with details of measurement techniques, analytical procedures, and operational definitions for each variable. (Sinha-OEIS)
W74-00017

QUARTERNARY BEACHES AND COASTS BETWEEN THE RUSSIAN RIVER AND DRAKES BAY, CALIFORNIA,
California Univ., Berkeley. Hydraulic Engineering Lab.
C. R. Minard, Jr.
Available from the National Technical Information Service as AD-733 280, $3.00 in paper copy, $1.45 in microfiche. Report no. HEL-2-35, August 1971. 223 p, 29 fig, 84 ref, 2 append. DACW72-71-C-0024.

Descriptors: Beaches, Coasts, *Shore protection, *Erosion, *Sedimentation, Geologic history, *Sediment transport, California.
Identifiers: *Coastal processes, *Near shore processes, Littoral zone, Sea level variations, Progradation, *Sand transport, Geomorphology, Heavy minerals, *Longshore transport.

Conditions were studied which in the past promoted or inhibited the movement of large quantities of sand down the coast of northern California from the Russian River to Double Point, and these conditions were compared with those at present. The influence of erosion and deposition on the sand budget was studied. Modern and ancient wave-cut platforms, sea cliffs, beaches, and coastal dunes were examined in the field and on air photos, and reconnaissance-type maps were drawn of these features. Heavy mineral analyses determined the source of deposits along the coast. Swells from the northwest move sand downcoast from northern California, but there is little net longshore transport west of the San Andreas Fault between the Russian River and Double Point. Sand carried by the river and coastal streams east of the fault is trapped upcoast at Tomales Bay. The headland at western Point Reyes blocks the sand flow. Beaches of the area contain heavy minerals from various sources. (Sinha-OEIS)
W74-00019

SAND MOVEMENT IN RELATION TO BEACH TOPOGRAPHY,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
D. S. McArthur.
Available from the National Technical Information Service as AD-693 123, $6.00 in paper copy, $1.45 in microfiche. Report No. TR-67, June 30, 1969. 26 p, 14 fig, 3 tab, 28 ref.

Descriptors: *Sediment transport, *Beaches, *Topography, *Sands, Waves (Water), Shoals, *Shallow water, Tracers, Sand bars, Currents (Water), Florida.
Identifiers: Hurricane Island (Florida), Alongshore transport, *Coastal processes, *Near shore processes.

Tracer experiments were conducted on the Gulf Coast beach of Hurricane Island, Florida, to obtain information on sediment transfer between foreshore, trough, and bar topography. Concurrent measurements of waves and currents were collected. Along-shore transport of tracer released in the three topographic zones was greater than normal-to-shore movement, even when the angle between wave crests and the shoreline was small. Seaward movement of tracer placed in the trough and bar zones took place during alongshore transport only when waves broke on the bar, and was most marked when wave steepness had a value near 0.04. During these conditions tracer released in the trough moved onto and along the bar crest. At other times landward displacement of bar and trough tracer accompanied alongshore transport. Tracer placed on the bar moved into the trough. Only when a subaqueous shoal replaced the trough immediately seaward of the beach step did appreciable amounts of tracer move seaward from the foreshore. Rhythmic topography appears, therefore, to provide an important mechanism for onshore-offshore movement of sediment within a beach system. Transport of tracer from the trough and bar onto the foreshore was negligible over all experiments. (Sinha-OEIS)
W74-00020

EQUILIBRIUM CHARACTERISTICS OF SAND BEACHES,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
P. S. Eagleson, B. Glenne, and J. A. Dracup.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 89, No 1, pt 1, Proceedings Paper 3387, p 35-57, January 1963. 11 fig, 2 tab, 17 ref.

Descriptors: *Shallow water, *Sediment transport, Erosion, Deposition (Sediments), Beaches, Sands, Equilibrium.
Identifiers: Suspended sediments, Beach profiles.

The principal problem under study is the equilibrium configuration of sand beaches in the zone offshore of appreciable breaker influence. Use is made of previous theoretical and experimental studies of the mechanics (bed load) of the motion of discrete spherical sediment particles moving on a plane, impermeable, sloping beach due to the action of shallow-water waves. Equations are developed which express the profile of an equilibrium sand beach in terms of the incident deep-water wave characteristics and the fluid and sediment properties. The offshore boundary condition of this equation is shown to govern not only the seaward limit of profile modification by the given wave but also whethe, with respect to its initial configuration, the new equilibrium profile requires an aggradation or degradation in the offshore zone. Laboratory experiments using sand

beaches of essentially uniform particle size provide reasonable confirmation of the theoretical prediction of the seaward extreme of profile modification and of the equilibrium profile in this region. Breaker effects, including the movement of suspended sediments, unaccounted for in the theory, distort the actual profile shoreward of this area. The experiments, together with those of another investigator, verify in all cases the aggrading-versus-degrading offshore profile classification given by the theory, thereby providing the engineer with a rational classification criterion that appears to be an improvement over the conventional technique which is based solely on the deep-water wave steepness. (Sinha-OEIS)
W74-00027

REORIENTATION OF CONVEX SHORES,
Florida State Univ., Tallahassee.
W. F. Tanner.
American Journal of Science, Vol 260, No 1, p 37-43, January 1962. 2 fig, 15 ref.

Descriptors: *Shores, *Sedimentation, Equilibrium, *Littoral drift, *Beaches, *Coasts, Energy loss, Shoaling, Beach erosion.
Identifiers: Wave refraction, Scalloped shorelines, Carolina Bays, Sand prism, Curvature, Convex shores.

Convex shores are commonly marked by downdrift decreases in energy. These decreases are due to wave refraction. Shores of this type develop an equilibrium outline by a combination of updrift erosion and downdrift deposition. The resulting form is a concavity or embayment having a radius of curvature equal to about one-fourth of the effective fetch. Several such concavities, with their intervening spits and shoals, may give the shore a 'scalloped' look; bays and lagoons having shores shaped in this fashion have been described as 'segmented'. The oval marshes known as the 'Carolina Bays' formerly may have been lakes that were given their nearly circular outlines in the same way. Not all coastal concavities are due to this process, however, and not all equilibrium shores have the scalloped outline. (Sinha-OEIS)
W74-00028

DYNAMICS OF SWASH AND IMPLICATION TO BEACH RESPONSE,

Descriptors: *Beaches, *Erosion, *Deposition (Sediments), *Sediment transport, *Sand waves, *Groundwater, Beach erosion, *Shallow water, *Waves (Water), Florida.
Identifiers: Santa Rosa Island (Florida), *Coastal processes, *Near shore processes, Swash, Collision.

A field investigation on a natural sand beach of the swash process and the inter-action of swash with input waves, beach ground water, and beach sand levels was conducted on Santa Rosa Island, Florida. During uprush and the initial part of backwash, the leading edge of the uprush behaved in a manner similar to that of a unit mass released upward on a frictionless slope with an initial momentum and acted on only by the downslope component of gravity. The initial momentum at the base of the slope was higher than expected from characteristics of input waves. Inundation periods under the swash predicted by the nonlinear wave theory of Shen and Meyer (J. Fluid Mechanics 16:108-125 1962) agreed with the data within 30%. However, whereas the theory predicted only a single water depth maximum associated with the uprush, the data exhibited two water depth maxima within a single swash cycle: one associated with uprush and another with backwash. The second maximum, which occurred only on the lower beach, resulted from either (1) a retrogressive bore growing in height while moving seaward or (2) collision between backwash and the uprush from a succeeding swash. The phenomenon of collision was characteristic of real swashes and was a direct result of periodic input waves. The collision process was ignored in the mathematical theory of Shen and Meyer, which was based on consideration of a solitary input wave. Swash power spectra consistently displayed three prominent peaks. The beach ground water level exhibited fluctuations of both interswash and beat frequencies. Sand level data revealed the possible presence of low amplitude sand waves which persistently migrated downslope during both erosion and nonerosion. These sand waves exhibited an average celerity on the order of 3-10 cm/sec and a -2 power frequency dependence below the equilibrium subrange. (Sinha-OEIS)

CONGO SUBMARINE CANYON AND FAN VALLEY,
Scripps Institution of Oceanography, La Jolla, Calif. Geological Research Div.
F. P. Shepard, and K. O. Emery.
The American Association of Petroleum Geologists Bulletin, Vol 57, No 9, p 1679-1691, September 1973, 10 fig, 11 ref.

Descriptors: *Submarine canyons, *Africa, Erosion, Continental shelf, Turbidity currents, Sediment transport, Estuaries.
Identifiers: *Congo submarine canyon.

Seventeen transverse profiles of the inner 400 km of the Congo Canyons and the Congo Fan Valley were made during a 4-day study in June 1972. These profiles show that the canyon is V-shaped with side slopes 400-1, 400 m high between the coast and a point 240 km seaward, where the axial depth is about 2,700 m. Farther seaward, the continuation as a fan valley narrows and is bordered by levees a few tens of meters high. Distributaries continue for at least an additional 320 km to depths of 4,900 m. Seismic profiles show that the canyon has been cut through a belt of diapirs. The absence of a broad delta at the mouth of the Congo River, the presence of a possible temporary fill at the head, a steep axial slope near the head, a submerged fan bordering the seaward side of the diapir belt, and levees at depth support the concept of origin of the canyon-fan-valley system largely through erosion and deposition by turbidity currents. Tidal-current scour probably helps to limit the amount of fill in the canyon head. (Knapp-USGS)

GRAIN SIZE STUDIES ON TURBIDITE COMPONENTS FROM TYRRHENIAN DEEP SEA CORES,
Kiel Univ. (West Germany). Geologisch-Palaeontologisches Institut und Museum.
M. Sarnthein, and C. Bartolini.
Sedimentology, Vol 20, No 3, p 425-436, August 1973, 6 fig, 2 tab, 15 ref.

Descriptors: *Particle size, *Bottom sediments, *Turbidity currents, Sands, Sedimentation, Sedimentology, Stratigraphy, Sediment sorting.
Identifiers: *Turbidities, *Tyrrhenian Sea, Pumice.

Through an analysis of their coarse--grain composition, pumice-rice sandy layers from deep sea cores were identified as shelf-derived turbidities rather than deposits due to ash fall or drifting pumice. A comparison of median sizes of individual grain types and total samples yielded significant trends in vertical and horizontal sorting, which allowed samples from different cores to be grouped into proximal and distal parts of one turbidite type. Planktonic molluscs and foraminifera have diameters 1.1 to 2.75 times larger than those of pumice. Weathered shallow-water skeletal materials have diameters approximately equal to pumice, whereas those of augite and hornblende are 1.25 to 2.3 times smaller. This results in a different proportion of components in proximal and distal turbidite samples. (Knapp-USGS)

HOLOCENE METEORIC DOLOMITIZATION OF PLEISTOCENE LIMESTONES, NORTH JAMAICA,
Texas Univ., Austin. Dept. of Geological Sciences.
L. S. Land.
Sedimentology, Vol 20, No 3, p 411-424, August 1973. 3 fig, 7 tab, 20 ref.

Descriptors: *Diagenesis, *Limestones, *Dolomite, *Groundwater, Sea water, Carbonates, Ion exchange, Water table, Magnesium, Calcium.
Identifiers: *Jamaica.

Removal of the unstable carbonate phases aragonite and Mg-calcite, and precipitation of calcite and dolomite is currently taking place where phreatic waters invade 120,000-year-old Pleistocene biolithites (Falmouth Formation), North Jamaica. Pleistocene rocks presently in the vadose zone are relatively unaltered, and consist of mineralogically unstable scleractinian biolithites. At the water table, a narrow zone of solution (a water table cave) is commonly encountered. Below the water table the rocks are invariably more highly altered than those above. Mg-calcites are very rare, and considerable dissolution of aragonite has commonly occurred. Dolomite occurs as 8-25 micrometers, subhedral to euhedral crystals replacing micrite, or precipitated as void linings. The isotopic composition of the dolomite and its high strontium content suggest precipitation as meteoric groundwaters oversaturated in CO2 invade the mineralogically unstable biolithites and dissolve Mg-calcites and Sr-rich aragonites. Because some dolomitized rocks are enriched in magnesium relative to unaltered biolithites, addition of magnesium to the system has occurred; it is probably derived from sea water in the mixing zone. Phreatic meteoric diagenesis is a rapid process, and it is capable of dolomitization. (Knapp-USGS)

EFFECT OF COMPACTION ON CHEMISTRY OF SOLUTIONS EXPELLED FROM MONTOMORILLONITE CLAY SATURATED IN SEA WATER,
University of Southern California, Los Angeles. Dept. of Petroleum Engineering.
G. V. Chilingarian, C. T. Sawabini, and H. H. Rieke.
Sedimentology, Vol 20, No 3, p 391-398, August 1973. 4 fig, 1 tab, 18 ref.

Descriptors: *Connate water, *Sea water, *Clays, *Compaction, Bottom sediments, Water chemistry, Ion exchange, Montmorillonite, Clay minerals, Leaching, Diagenesis.

The total mineralization of solutions squeezed out of montmorillonite clay saturated in sea water was determined at different overburden pressures. The subsequent fractions of expelled solutions were also analyzed for C1, SO4, HCO3, F, Na, K, Mg, Ca, and B. The concentrations of squeezed-out

solutions during the initial stages of compaction (at pressures up to 35 kg/sq cm) are slightly higher than that of interstitial solution present initially. The concentration of squeezed-out solution goes through a maximum, or at least remains constant, before starting to decrease with increasing overburden pressure. (Knapp-USGS)

USE OF THE MODEL T COULTER COUNTER IN SIZE ANALYSIS OF FINE TO COURSE SAND,
University of East Anglia, Norwich (England). School of Environmental Sciences.
I. N. McCave, and J. Jarvis.
Sedimentology, Vol 20, No 2, p 305-315, May 1973. 6 fig, 2 tab, 8 ref.

Descriptors: Particle size, *Instrumentation, Sieve analysis, Electrical conductivity, Calibrations.
Identifiers: *Particle size analysis.

An electrical sensing-zone particle size analyzer was calibrated for use with sands. A saline/glycerol electrolyte is used with a concentration of 0.1-0.5 g/liter of suspended sand. Calibration error is 1.6%. Comparison of counter and sieving results shows close agreement. Advantages of the machine are rapidity--a prepared sample can be analyzed in 60 sec--and the small size of the sample required. (Knapp-USGS)
W74-00103

WHISTLING SAND BEACHES IN THE BRITISH ISLES,
London Univ. (England). School of Pharmacy.
K. Ridgway, and J. B. Scotton.
Sedimentology, Vol 20, No 2, p 263-279, May 1973. 9 fig, 19 ref.

Descriptors: *Beaches, *Sands, *Particle size, *Particle shape, *Sediment sorting, Beds (Stratigraphic), Continental shelf, Sediments, Sedimentology.
Identifiers: *Whistling sands, *United Kingdom.

Beaches which squeak or whistle when walked on have been known for many years. Sand from 33 beaches in the British Isles whistles. Size distributions of all these sands were obtained by sieving, and the particle shape distribution in the peak size fractions was measured by using a vibratory shape-sorting table. A physical mechanism is suggested for the production of the whistle, which depends upon a close size grading coupled with a spherical grain shape. The locations at which whistling sand occurs correlate quite well with the landward ends of bed-load partings in the continental shelf sand transportation pattern as determined from side-scan Asdic surveys. (Knapp-USGS)
W74-00104

SETTLING BEHAVIOUR RELATED TO SIEVE ANALYSIS OF SKELETAL SANDS,
Dundee Univ. (Scotland). Dept. of Geology.
C. J. R. Braithwaite.
Sedimentology, Vol 20, No 2, p 251-262, May 1973. 4 fig, 12 ref.

Descriptors: *Settling velocity, *Particle shape, *Particle size, *Sieve analysis, Sands, Limestones, Carbonate rocks, Carbonates, Sediments, Sedimentation, Sedimentology.
Identifiers: *Skeletal sands, Bioclastic sediments.

The settling velocities of 1000 grains selected from sieved samples of bioclastic sand were individually measured in a 250-cm column of seawater. Four fall regimes are represented: straight fall, spinning and spiral modes, and erratic tumbling. As size increases grains pass through this series at rates dependent upon shape and effective density. Computed best-fit curves for velocities at intermediate diameters and an equivalent sphere of intermediate diameter illustrate considerable divergencies in behavior between the grain types and shape classes examined. Current methods of analysis of carbonate sediments, by sieving, by grain-counting of components, and by sedimentation balance, provide different kinds of information which have no simple relationship to each other. (Knapp-USGS)
W74-00105

CARBONATE CEMENTATION OF SOME PLEISTOCENE TEMPERATE MARINE SEDIMENTS,
Southampton Univ. (England). Dept. of Geology.
I. M. West.
Sedimentology, Vol 20, No 2, p 229-249, May 1973. 6 fig, 1 tab, 35 ref.

Descriptors: *Dagenesis, *Limestones, *Calcite, Sands, Leaching, Ion exchange, Sandstones, Beaches, Carbonates, Carbonate rocks.

Carbonate cementation of some carbonate and quartz sands in three raised beaches of temperate origins was derived from the dissolution of skeletal debris. The sandstones now possess only low magnesium calcite, but the original sediments, like adjacent modern beach and blown sands, probably contained low magnesium calcite, aragonite, and some high magnesium calcite, all of skeletal origin. The dissolution occurred within minute tubules of sand. Concurrent deposition in adjacent volumes of sand of low magnesium calcite formed cements that are irregularly nodular or uneven on a small scale. Aragonite within the minute nodules was replaced paramorphically by low magnesium calcite. (Knapp-USGS)

SELECTIVE TRANSPORT OF HEAVY MINERALS BY SHOALING WAVES,
Florida State Univ., Tallahassee. Dept. of Geology.
J. P. May.
Sedimentology, Vol 20, No 2, p 203-211, May 1973. 3 fig, 1 tab, 12 ref.

Descriptors: *Sediment transport, *Beaches, *Sands, *Surf, Mineralogy, Sediment sorting, Waves (Water), Sedimentation, Sedimentology, Beds (Stratigraphic), Hydraulic models, Model studies.
Identifiers: *Heavy minerals.

A model to account for the occurrence of heavy mineral concentrations as discrete lamina on beaches is based on the shoreward variation in the distribution of bottom fluid velocities due to shoaling water waves. This variation causes some portions of the sediment population to be transported shoreward at a faster rate than other portions. On moderate energy shorelines composed of sand-sized sediment the selectively transported portion may include the relatively hard-to-move heavy mineral fraction. Wave tank experiments with artificially prepared sediment populations provide empirical support for the proposed model. Under some conditions of water depth and wavelength, the heavy mineral fraction of the sediment population moved shoreward at a faster rate than did the light mineral fraction. (Knapp-USGS)

IN SITU MEASUREMENT OF SEDIMENT SOUND SPEED DURING CORING,
Texas Univ., Austin. Applied Research Labs.
D. J. Shirley, A. L. Anderson, and L. D. Hampton.
Available from NTIS, Springfield, Va. 22151, AD-758659 Price $3.00 printed copy; $1.45 microfiche. ONR Contract N00014-70-A-0166-0005.

Descriptors: *Core drilling, *Bottom sediments, *Oceanography, *Acoustics, *Sounding, Velocity, Instrumentation, Analytical techniques, Sedimentology, Logging (Recording), Drilling, Electrical properties, Electrical equipment, Data collections, Geology, Gulf of Mexico, Coasts.

A system has been developed for attachment to sediment corers to obtain an in situ sound speed profile during a coring operation. The system uses two electroacoustic transducers mounted in the cutting head of the corer and associated electronic circuitry to measure the travel time of an acoustic pulse traversing the diameter of the sediment core. Laboratory and field tests which demonstrate the capabilities of the measurement technique are reported. Results show accurate in situ sound speed values as well as sound speed variations which have high correlation with sediment lithology. Sound speed profiles were obtained in the Gulf of Mexico using a piston corer and in coastal waters using a special shallow water coring rig. Limited examination of the feasibility of measuring acoustic attenuation and volume scattering is also reported. The conclusion is that these measurements should be incorporated in the sound speed measurement technique reported here. (Woodard-USGS)

SEA-SURFACE CIRCULATION, SEDIMENT TRANSPORT, AND MARINE MAMMAL DISTRIBUTION, ALASKA CONTINENTAL SHELF,
Alaska Univ., College. Inst. of Marine Science.
G. D. Sharma, F. F. Wright, and J. J. Burns.
Available from NTIS, Springfield, Va., 22151 as E73-10370 Price $3.00 printed copy; $1.45 microfiche. Contract Report for NASA Goddard Space Flight Center, February 20, 1973. 33 p, 13 fig, 3 ref, 2 append.

Descriptors: *Sediment transport, *Water circulation, *Remote sensing, *Aerial photography, *Satellites (Artificial), *Alaska, Oceans, On-site investigations, Correlation analysis, Currents (Water), Data collections, *Continental shelf.
Identifiers: *Cook Inlet area (Alaska), *Bering Sea, Chukchi Sea.

Water and sediment movements and factors controlling sea mammal distribution were observed from ERTS multi-spectral scanner imagery. Emphasis during the first half year was upon data from the Cook Inlet area of southern Alaska and from the Bering Sea and Chukchi Sea of the northwest. Relatively, both these areas are accessible for ground truth observations, and the weather permitted the collection of useful ERTS imagery. The Bristol Bay area has also provided satisfactory imagery and it is anticipated that information from the extreme eastern end of this area will be available in useful quantities. The major effort was to obtain synchronous ground truth and satellite imagery. This is pertinent to the total understanding of the ERTS-1 imagery. Undoubtedly the sediments in the water column as observed from the ERTS imagery reflect the sources and movement of sediments and thereby elucidate the coastal sea surface circulation pattern. Detailed interpretation of sediment distribu-

tion and water circulation on the entire shelf, however, requires a more cautious approach. The turbid water as observed in the ERTS-1 imagery could be a result of biological material as well as sedimentary material. (Woodard-USGS)

CONTINUITY OF TURBIDITY CURRENT FLOW AND SYSTEMATIC VARIATIONS IN DEEP-SEA CHANNEL MORPHOLOGY,
Oregon State Univ., Corvallis. School of Oceanography.
P. D. Komar.
Geological Society of America Bulletin, Vol 84, No 10, p 3329-3337, October 1973. 9 fig, 17 ref. NSF Grant GA-32122.

Descriptors: *Submarine canyons, *Turbidity currents, *Channel morphology, Continental shelf, Erosion, Geomorphology, Sedimentation, Sediment transport, Pacific Ocean.
Identifiers: *Cascadia Channel (Pacific Ocean).

When a turbidity current flow decreases in velocity due to a decrease in bottom slope, the thickness of the flow must correspondingly increase to maintain continuity of discharge. This increase is a possible explanation for observed systematic increases in the relief of submarine channels along their lengths. A simplified computer model of turbidity current flow along a channel indicates that without any dilution of the flow by water entrainment, a reasonable decrease in channel-axis slope could more than double the thickness of the flow. With dilution, the thickness could easily increase by a factor of four or more. The approach was applied to Cascadia Channel, located off the coast of the northwest United States, to test whether reasonable amounts of flow dilution could account for the observed increase in channel relief. Continuity of flow could explain much of the increase, but subsequent channel erosion has to be called upon to account for the entire increase in channel cross-sectional area. (Knapp-USGS)

SOME STUDIES ON WAVE REFRACTION IN RELATION TO BEACH EROSION ALONG THE KERALA COAST,
Indian Ocean Physical Oceanographic Centre of the Indian Ocean Expedition, Ernakulam.
P. K. Das, V. Hariharan, and V. V. R. Varadachari.
Proceedings of the Indian Academy of Sciences, Vol 64, No 3, p 192-202, September 1966. 6 fig, 3 tab, 6 ref.

Descriptors: *Waves (Water), *Refraction, *Beach erosion, Sedimentation, Deposition (Sediments), Ocean waves, Coasts, *Indian Ocean.
Identifiers: *India (Kerala coast), *Wave refraction, *Near shore processes, Short period waves, Longshore currents.

Using the British Admirality bathymetric charts off the West Coast of India and employing the graphical method of constructing wave refraction diagrams, an attempt is made to study the behavior of the short-period waves (4, 5, and 6 seconds) which are found to affect the coast generally in the neighborhood of Cochin Port entrance. Nineteen stations, at intervals of roughly one mile, are chosen around the three-fathom line in this area. Considering a probable field of approach of deep-water waves, limited to a cone of 90 degrees, five directions of approach are chosen at intervals of 22 1/2 degrees in the range of 202 1/2 degrees to 292 1/2 degrees. Refraction diagrams are prepared for these directions and periods, and from these, the refraction functions and directional parameters are evaluated for each station. The possible directions of flow of long-shore current and the areas vulnerable to erosion and sedimentation are investigated. (Sinha-OEIS)

MECHANISM OF SAND MOVEMENT ON COASTAL DUNES,
California Univ., Berkeley. Dept. of Civil Engineering.
A-L. A. Kadib.
Journal of the Waterways and Harbors Division, American Society of Civil Engineers, Vol 92, No WW2, Proceedings Paper 4817, p. 27-44, May 1966. 1 tab, 13 ref.

Descriptors: *Sediment transport, *Coasts, *Littoral drift, *Wind erosion, Saltation, Sediment load, *Dune sands, *Beaches.
Identifiers: *Near shore processes, Water transport, Wind transport, Wind action, Sand dunes.

The investigation, concerned with the study of the mechanism of sand movement by wind action, developed a method for calculating the rate of sand transport. This method is based on the Einstein theory for sediment transport in rivers and most available field and laboratory measurements on sand movement by wind. The main findings can be summarized as follows: The turbulence or velocity pulsations are largely responsible for sand movement by wind and their effect should be introduced. The description of the transport rate based on the effect of saltation only is misleading and the variation in the flow conditions at the bed should be included. Basically, the main principles governing the rate of sediment transport by water and air are the same. The only difference appears to be the effect of saltation in distrubing the bed surface in the case of air. The method is applicable for calculating the rate of sand transport under a wide range of wind velocities and for sand sizes ranging from 0.145 mm to 1.00 mm. (Sinha-OEIS)

STUDIES ON THE CURRENTS IN THE LITTORAL ZONE OF THE WALTAIR BEACH,
Andhra Univ., Waltair (India). Dept. of Meteorology and Oceanography.
R. Ramanadham, R. Varadarajulu, and B. R. Reddi.
Indian Journal of Pure and Applied Physics, Vol 3, No 7, p 269-271, July 1965. 1 fig, 6 ref.

Descriptors: *Deposition (Sediments), Sands, Harbors, Littoral, Shores, Circulation, Currents, *Sediment transport, *Coasts, *Shallow water.
Identifiers: *India (Waltair Beach), Breaker zone, wave rays, Littoral currents, *Littoral processes.

With a view to understanding the various processes responsible for the deposition of the sand in the harbor entrance channel, a study of the currents near the shore of the Waltair beach has been made using a light spherical float. The general circulation beyond the breaker zone and the littoral currents have been found to be in opposite directions. The magnitude of the currents increases towards the shore and the currents are in the same direction as that of the wave-rays. The direction of the littoral currents is towards the harbor entrance channel during the month of February. (Sinha-OEIS)

COASTAL PROCESSES AROUND THE OTAGO PENINSULA,
Otago Univ., Dunedin (New Zealand). Dept. of Geology.
W. A. Hodgson.
New Zealand Journal of Geology and Geophysics, Vol 9, No 1/2, p 76-90, July 1966. 7 fig, 15 ref.

Descriptors: *Coasts, *Beaches, *Waves (Water), *Refraction (Water waves), Shores, *Shallow water, Sediments, *Sediment transport, Drowned (Submerged), Littoral drift, Seashores, *Sand spits.
Identifiers: *New Zealand (Otago Peninsula), Swell, Longshore drift, Breaker zone.

Observations of the wave conditions around the Otago Peninsula were made during the period December 1963 to December 1964. From these observations the influence of sea and swell waves in developing the beaches and spits of this part of the Otago coastline has been assessed. The beaches, including the 'southward' - pointing spits of the peninsula, have developed largely in response to a dominant southerly swell of 10-15 sec. period, in spite of intense refraction. North of the peninsula, in an area sheltered from the swell, the dominant waves are produced by the north-easterly sea, which promotes some beach drift from north to south. The energy of dominant waves and the evolution of shoreline curves on a coast of submergence are discussed. (Sinha-OEIS)

Identifiers: Beach nourishment, *Jupiter Island (Fla).

Jupiter Island, Florida, suffered severe damage to its ocean front in 1962. Heavy swells in March and Northeast storms in November and December removed most of the material from the ocean beach and exposed bulkhead walls to severe wave attack. Emergency dredging was used to place 60,000 yd of material on the beach, structures were reinforced by use of granite boulders and construction of groins, but the problem of continuing beach nourishment was solved in a unique manner. A drag-scraper was used to excavate material from the offshore bottoms, a distance of 800 ft seaward of ordinary high water. This beach nourishment program from offshore sources has been in progress for two summers; results to date (1965) are encouraging. (Sinha-OEIS)

EFFECTS OF THE ALASKA EARTHQUAKE AND TSUNAMI ON RECENT DELTAIC SEDIMENTS,
Scripps Institution of Oceanography, La Jolla, Calif.
E. Reimnitz, and N. F. Marshall.
Journal of Geophysical Research, Vol 70, No 10, p 2363-2376, May 15, 1965. 12 fig, 9 ref. Nonr 2216 (23).

Descriptors: *Coasts, *Tsunamis, *Alaska, Sediments, *Deltas, Erosion, *Sedimentation, Seiches, *Earthquakes, Ecology.
Identifiers: Tidal flats, Salt marshes, Barrier islands.

The Alaska Good Friday earthquake (its epicenter about 80 mi from the Copper River delta) and the events associated with the quake left indelible marks on the recent sediments of the delta. A relatively dense pattern of earthquake shock structures is found in the upper part of the section. These include sand dikes, sand pipes, slumps, faults, and joints. The structures increase in abundance toward the central part of the delta, where sediments are thickest, and become rare along its fringes, where sediments are thinnest. The 6-ft uplift of the region was responsible for some erosion and other immediate changes. But the establishment of a new equilibrium, biologically as well as geologically, for barrier islands, tidal flats, and marshes, will advance only gradually over the next few years. Seiches, brought about by the earthquake, with current velocities of up to 20 or 30 knots, regionally planed off the upper 2 or 3 ft of the tidal flats. These areas often are marked by accumulations of clam shells. The eroded materials were dumped into deep channels and troughs. (Sinha-OEIS)

AN EXPERIMENTAL STUDY OF HEAVY--MINERAL SECREGATION UNDER ALLUVIAL-FLOW CONDITIONS,
Geological Survey, Washington, D.C.
L. L. Brady, and H. E. Jobson.
Available from Sup Doc, GPO, Washington, D.C. 20402 - Price $0.85. Professional Paper 562-K, 1973. 38 p, 24 fig, 7 tab, 38 ref, append.

Descriptors: *Sediment transport, *Alluvial channels, *Sedimentation, *Sediment distribution, *Mineralogy, Model studies, *Rio Grande River, Sands, Sedimentology, Particle size, Suspended solids, Bottom sediments, Sampling, Cores, *New Mexico.
Identifiers: *Heavy mineral segregation (Sedimentation), *Ilmenite, *Magnetite, Opaque minerals.

Segregation of opaque minerals (mainly ilmenite and magnetite) from the light minerals in a natural sand was observed in a large (61 x 2.44 x 1.22 meters) recirculating water-sediment flume. Bed material (medium size 0.286 millimeter) used in the study was taken from the Rio Grande near Bernardo, N. Mex. Opaque heavy minerals (medium size 0.144 millimeter) amounted to 0.38% of the bed-material volume. Significant hydraulic variables and the sorting and bedding patterns of the bed material were observed for four different bed configuations: a flat bed (upper flow regime), a transition bed, and two different dune beds (lower flow regime). Accumulations of opaque heavy minerals were formed as three basic types: (1) thin accumulations of small extent that were associated with the upstream or stoss slopes of dunes; (2) accumulation associated with the topset deposits of large dunes and with dunes formed in the transition flow; and (3) accumulations associated with the flat-bed condition. The most important factors influencing the type and amount of accumulation of opaque heavy minerals are bed configuration and grain density. The most widespread deposits were the segregations of heavy minerals associated with the base of the flat beds. (Woodard-USGS)

Identifiers: *Selenium, *Blood, Detection limits, Chemical interference, Chemical recovery, Sensitivity, Reproducibility, Biological samples, Sample preparation, Electron capture gas chromatography.

Samples to be analyzed for selenium are prepared by reacting selenium (IV) with 2,3-diaminonaphthalene at pH 2 to form the well established complex, which is extracted into hexane. An aliquot of the hexane layer is analyzed gas chromatographically with an electron-capture detector. As little as 5 times 10 to the minus 10 g of selenium could be detected; 0.01 microgram of selenium could be determined in a sample by extracting into 0.1 ml of hexane and injecting a 5-microliter aliquot of the extract. The method was applied to the determination of physiological amounts of selenium in human blood and urine. Averages of 0.38 p.p.m. and 0.007 p.p.m. selenium were found in blood and urine, respectively. River water samples were also analyzed. Complete analysis time for a sample is less than 3 h, including time for digestion of the sample and 2 h for formation of the complex. (Little-Battelle)

DETERMINATION OF SOME RARE-EARTH ELEMENTS BY PLASMA-JET EMISSION SPECTROMETRY,
Kitami Inst. of Tech. (Japan).
I. Atsuya, and H. Goto.
Analytica Chimica Acta, Vol 65, No 2, p 303-309, July 1973. 6 fig, 3 tab, 14 ref.

Descriptors: *Pollutant identification, *Aqueous solutions, *Chemical analysis, Methodology, *Spectrophotometry.
Identifiers: Magnetic field, *Rare earth elements, *Plasma-jet emission spectrometry, Spectral analysis, Detection limits, Lanthanum, Yttrium, Accuracy, Gadolinium, Monazite, Precision, Scandium, Praseodymium, Neodymium, Samarium, Cerium.

The effects of a magnetic field on spectral intensities in plasma-jet spectrometry were examined, and detection limits for rare-earth elements were calculated. Plasma-jet emission spectrometry was applied to the determination of lanthanum, yttrium and gadolinium in a monazite sample from which thorium had been separated. A standard addition method was used in order to improve accuracy, and the internal standard and background compensation method was applied to measurements of spectral line intensities to achieve good precision. The coefficient of variation was 1.51 percent for 50 micrograms La/ml. (Holoman-Battelle)

A MODEL FOR CHEMICAL EXCHANGE IN THE BASALT-SEAWATER SYSTEM OF OCEANIC LAYER II,
Oregon State Univ., Corvallis. School of Oceanography.
R. A. Hart.
Canadian Journal of Earth Sciences, Vol 10, No 6, p 799-816, June 1973. 7 fig, 6 tab, 51 ref. NSF Grants GA-135 16, GA-27548, GA-35406.

Descriptors: *Weathering, *Water chemistry, *Sea water, *Basalts, Leaching, Potassium, Magnesium, Sodium, Silica, Calcium, Iron, Manganese, Chemical reactions, Geochemistry, Oceanography.

The upper 2-3 km of oceanic layer II is a zone of chemical reaction between seawater and the oceanic crust as it moves away from the midocean ridges. The principal alteration products resulting from the action of seawater on primary basalts are K-rich smectite formed during weathering of basalt, chlorite formed during retrograde metamorphism, and albite-actinolite formed during primary greenschist metamorphisma at the ridge crest. These three processes in combination extract most of the stream input of K, Mg, and Na, and add Si02, Ca, Fe, and Mn to the ocean systems in amounts comparable to stream input. The steady-state reactions of basalt with interstitial seawater to produce alteration minerals exercise a strong influence in the chemistry of seawater and release energy in amounts sufficient to form a portion of normal heat flow measured on the ocean floor. Identifiers: *Liquid chromatography, *Trace levels, Detection limits, Reproducibility, Droppingmercury electrode, Sensitivity, Precision, Parathion, Methyl parathion.

Construction and operation details are given for a simple, inexpensive system used for liquid chromatography which is capable of separations whose speed and detection limits are comparable or superior to many commercial units. The system consists of a microdetector based on the principle of polarography with a dropping mercury electrode (DME), an electronic measuring circuit, a high pressure solvent pumping device, a sample injector, and highly efficient chromatographic columns. This system has been tested using parathion and methyl parathion. The minimum detectable quantity was about 0.01 microgram with a coefficient of variation of plus or minus 1.8 percent. In addition to compounds which are reducible at the DME at electrode potentials between -0.3 and -2.0 volts (the useful range for aqueous or aqueous-alcohol solvent systems), other classes of compounds were detected, e.g., those exhibiting catalytic waves. All components of the system are readily available or easily fabricated, and the cost, exclusive of strip-chart recorder, is approximately $200. (Holoman-Battelle)

VOLTAMMETRIC DETERMINATION OF NITRATE AND NITRITE IONS USING A ROTATING CADMIUM DISK ELECTRODE,
Iowa State Univ., Ames. Dept. of Chemistry.
R. J. Davenport, and D. C. Johnson.
Analytical Chemistry, Vol 45, No 11, p 1979-1980, September 1973. 3 fig, 24 ref.

Descriptors: *Nitrates, *Nitrites, *Pollution identification, *Methodology, Chemical analysis, Electrochemistry, Aqueous solutions, Ions.
Identifiers: *Rotating cadmium disk electrodes, *Voltammetry, Rotating disc electrodes, Cadmium electrodes.

Cathodic current-potential curves are described which have been obtained with a rotating cadmium disk electrode (RCDE) in weakly acidic solutions of nitrate and nitrate ions. At low rotational velocities and bulk concentration, the cathodic currents are limited by convective-diffusional mass transport. Based on the reported results it is thought that rapid procedures for the accurate determination of nitrate and nitrite ions in aqueous solutions can be developed based on voltammetry with cadmium electrodes. Many species are expected to interfere in the determination including oxygen and transition metal cations which can be reduced at the electrode and separations are required. (Holoman-Battelle)

SILICA GEL AS AN INSOLUBLE CARRIER FOR THE PREPARATION OF SELECTIVE CHROMATOGRAPHIC ADSORBENTS - THE PREPARATION OF 8-HYDROXYQUINOLINE SUBSTITUTED SILICA GEL FOR THE CHELATION CHROMATOGRAPHY OF SOME TRACE METALS,
Rothamsted Experimental Station, Harpenden (England). Biochemistry Dept.
J. M. Hill.
Journal of Chromatography, Vol 76, No 2, p 455-458, February 28, 1973. 14 ref.

Descriptors: *Trace elements, Copper, Adsorption, Manganese, Zinc, Heavy metals.
Identifiers: *Chelation chromatography, *8-Hydroxyquinoline, *Aminopropyl silica gel, Adsorbents, 3-Aminopropyl triethoxy silane, Diazotization, Sample preparation.

Aminopropyl silica gel made by treating chromatographic grades of silica gel with 3-aminopropyl triethoxy silane, is reacted with p-nitrobenzoyl chloride and the -NO2 group reduced to -NH2 with sodium dithionite. Diazotization and reaction with 8-hydroxyquinoline produces a dark red silica gel derivative which can be used for the removal, concentration and separation of trace amounts of copper and other biologically important trace-metal cations from solutions of high ionic strength. The preparation of other selective adsorbents with different reactive groups is discussed. (Holoman-Battelle)

J. Kegel.
Zeitschrift fur Analytische Chemie, Vol 265, No 4, p 253-256, July 12, 1973. 4 ref.

Descriptors: *Carbon dioxide, *Theoretical analysis, Methodology, Gases, Chemical analysis, *Water analysis, Estimating, Pollutant identification.
Identifiers: *Quantitative analysis, *Natural waters, Errors.

The theoretical examination of errors, undertaken by Hasselbarth (1965) on a new method to determine free carbon dioxide in water is investigated and it is found that he had employed wrong bases and arrived at misleading results. In his practical work, he had not considered all the possibilities of the method, which explains a number of differences. Therefore, the practical application of the method is described in detail. Identifiers: *GC-Plasma chromatography, Sensitivity, GC-Mass spectrometry, Signal-noise ratios, Flame ionization detectors.

A gas chromatography has been applied to a new rapid scan (20 msec) plasma chromatography without the use of a molecular separator. The sensitivity, noise, and signal-to-noise ratio for Freons analyzed on the plasma chromatography were found to be relatively insensitive to changes in the plasma chromatography carrier and drift gas flow rates, and a unique mass calibration curve for the E-series Freons is reported. The sensitivity of the plasma chromatograph and GC FIDs are compared for Freons and the utility of the plasma chromatography in identifying GC effluents and peak fractionation is reported. A comparison is made between gas chromatography/plasma chromatography and GC/MS. (Holoman-Battelle)

G. S. Johar, and G. D. Tiwari.
Zeitschrift fur Analytische Chemie, Vol 265, No 1, p 32, May 25, 1973.

Descriptors: *Nitrites, *Pollutant identification, Chemical analysis, Aqueous solutions, Iodides, Color reactions.
Identifiers: *Trace levels, *Congo Red, *Malachite Green, Detection limits, Sensitivity, Chemical interferences, Azides, Chromogenic reagents.

Two procedures are outlined for a rapid and sensitive detection of minute quantities of nitrate. One procedure employs Malachite Green as the color-developing reagent with a detection limit of 75 micrograms nitrite per 0.25 ml. The other procedure uses Congo Red; the detection limit is 550 micrograms per 0.5 ml. Common anions and cations do not interfere in the tests. The only interference is caused by iodide and by azide in large amounts. (Holoman-Battelle)

T. R. Gilbert, and D. N. Hume.
Analytica Chimica Acta, Vol 65, No 2, p 451-459, July 1973. 4 fig, 2 tab, 20 ref.

Descriptors: *Sea water, *Chemical analysis, Methodology, *Pollutant identification, Water analysis, Electrochemistry, Water sampling, Water storage, Copper, Plastics, Metals.
Identifiers: *Bismuth, *Antimony, *Anodic stripping voltammetry, Graphite electrodes, Sample preparation, Detection limits, Chemical loss, Silver, Chemical interference.

A method based on anodic stripping voltammetry at the mercury-coated graphite electrode has been developed for the direct determination of bismuth and antimony at their natural levels in seawater. Bismuth plated at -0.4 V from seawater made 1 M in hydrochloric acid gives a stripping peak proportional to concentration at -0.2 V without interference from antimony or other metals normally present. Antimony may be plated from seawater made 4 M in hydrochloric acid and gives a stripping peak at -0.2 V proportional to the sum of bismuth and antimony. By use of the standard addition technique, satisfactory results were obtained for seawater samples with concentration ranges of 0.02-0.09 microgram/kg for bismuth and 0.2-0.5 microgram/kg for antimony. MESITYL OXIDE AS AN EXTRACTING AGENCY FOR BERYLLIUM,
Indian Inst. of Tech., Bombay. Dept. of Chemistry.
P. V. Dhond, and S. M. Khopkar.
Analytical Chemistry, Vol 45, No 11, p 1937-1938, September 1973. 2 tab, 9 ref.

Descriptors: *Separation techniques, *Beryllium, *Aqueous solutions, Metals, Chemical analysis.
Identifiers: Chemical interference, *Mesityl oxide, Sample preparation, Chemical recovery.

Beryllium nitrate was dissolved in distilled water to investigate the usefulness of mesityl oxide (4-methyl-3-pentene-one) as an extracting agent. The procedure involved adding hydrochloric acid and potassium thiocyanate to an aliquot of solution containing 20 micrograms Be, transferring the aqueous phase to a separatory funnel, and extracting with mesityl oxide for 3 minutes. After the two layers separate, Be is stripped off by shaking once with distilled water. Sodium acetate is added to the aqueous phase, the pH adjusted, aluminon is added, the solution allowed to stand for 20 minutes, and the absorbance measured at 530 nm. The method is simple, sensitive, and selective, and applicable at microgram concentrations of Be. Common inorganic and organic ions were well tolerated. Recovery of Be was 99.5 percent plus or minus 0.5 percent. (Little-Battelle)

IMPROVEMENTS IN THE MANGANESE DIOXIDE COLLECTION OF TRACE LEAD AND BISMUTH IN NICKEL,
International Nickel Co. of Canada Ltd., Sheridan Park (Ontario). J. Roy Gordon Research Lab.
St. J. H. Blakeley, A. Manson, and V. J. Zatka.
Analytical Chemistry, Vol 45, No 11, p 1941-1943, September 1973. 5 tab, 3 ref.

Descriptors: *Separation techniques, *Lead, *Nickel, Hydrogen ion concentration, Heavy metals, Aqueous solutions, Chemical precipitation.
Identifiers: Sample preparation, Coprecipitation, *Bismuth, Atomic absorption spectrophotometry, Chemical recovery, Detection limits, Accuracy, Reproducibility, *Trace levels.

Investigation of the method of using manganese dioxide for coprecipitating microgram quantities of lead and bismuth in nickel prior to atomic absorption analysis showed that lead recoveries were low and not reproducible. Using aqueous solutions of the metals dissolved in acid, it was found that formation of manganese dioxide in a boiling solution, as used in the method, results in a precipitate which has its collecting power for lead substantially reduced by the high ionic strength of the solution due to the large excess of nickel ions. By raising the pH to 4.5 and by performing the permanganate oxidation in the cold solution, the extent of lead collection increased to 94-99 percent in a single precipitation. However, for the highest accuracy, a second precipitation is recommended for complete collection of lead. The working range of the method is 5-120 micrograms each of lead and bismuth. The precision, expressed as relative standard deviation, is 0.03 microgram lead and 0.05 microgram bismuth. (Little-Battelle)

BIS-AROYLHYDRAZONES OF ALPHA--DIKETONES AS REAGENTS FOR COLORIMETRIC AND FLUORIMETRIC DETERMINATIONS OF CALCIUM, CADMIUM AND OTHER CATIONS,
Greenlane Hospital, Auckland (New Zealand). Pathology Dept.
M. Lever.

Analytica Chimica Acta, Vol 65, No 2, p 311-318, July 1973. 3 fig, 3 tab, 3 ref.

Descriptors: Pollutant identification, *Color reactions, *Cations, *Fluorometry, *Colorimetry, *Chemical analysis, Aqueous solutions, Selectivity, Chemical reactions, Zinc, *Calcium, *Cadmium, Fluorescence, Sulfides, Magnesium, Strontium, Aluminum, Copper, Manganese, Alkaline earth metals, Heavy metals, Organic compounds, Methodology.
Identifiers: *Chromogenic reagents, *Bis-aroylhydrazones, Complexing agents, Metal chelates, Cyanides, Chemical interference, Thiols, Barium, Tin, Citrates, Fluorescent spectra, Molar absorptivity, Rare earth elements.

An evaluation has been made of the potential of the bis (4-hydroxybenzoylhydrazones) of glyoxal, methylglyoxal, and dimethylglyoxal as reagents for the colorimetric and fluorometric determination of metallic cations. Bis-aroylhydrazone solutions in 10 mM aqueous NaOH were used to study the effect of cations. The effects of using different bases and of varying their concentrations were investigated. Reagents such as cyanide (20 mM) and citrate (0.2 M) were added to alter the selectivity of the color reactions. Fluorescence measurements were also made in ethanol and other solvents. The bis (4-hydroxybenzoylhydrazones) of glyoxal, methylglyoxal and dimethylglyoxal form colored chelates with Ca (2 plus), Cd (2 plus), La (3 plus), a Bi (III) species and other cations. The glyoxal derivative shows more selective reactions, and highly selective assays are possible for calcium and cadmium in the presence of cyanide and citrate, respectively; Beer's law was obeyed in the range 0-50mM for both cations. The chelates were also fluorescent, the reaction for lanthanum being particularly sensitive. The formation of this type of chelate is a general property of the bis-aroylhydrazones of alpha-diketones. (Holoman-Battelle)

THE SOLVENT EXTRACTION OF THE TERNARY COMPLEXES OF IRON (II)--RHODAMINE B WITH VARIOUS NITROSOPHENOLS. DETERMINATION OF IRON IN WATERS,
Okayama Univ. (Japan). Dept. of Chemistry.
T. Korenaga, S. Motomizu, and K. Toei.
Analytica Chimica Acta, Vol 65, No 2, p 335-346, July 1973. 7 fig, 7 tab, 18 ref.

Descriptors: *Iron, *Water analysis, *Solvent extractions, *Pollutant identification, Separation techniques, Methodology, Chemical reactions, Potable water, Color reactions, Chelation, Hydrogen ion concentration, Chemical analysis, Sodium, Potassium, Magnesium, Calcium, Chlorides, Nitrates, Sulfates, Carbonates, Rivers, Heavy metals, Cations, Anions, Selectivity, Aqueous solutions.
Identifiers: *Rhodamine B, Complexing agents, *Nitrosophenols, *Metal complexes, Absorbance, Chromogenic reagents, Natural waters, Chemical recovery, Sensitivity, Metal chelates, Benzene, Organic solvents, Nitrosonaphthols, Molar absorptivity, Ammonium, Chemical interference, Tiocyanates, Xylenol orange, Chrome azurol S, Pyrocatechol violet.

Twenty nitrosophenols and nitrosonaphthols were examined as reagents for ternary complex formation with iron (II) and rhodamine B. Only reagents containing electron-attracting substituents, such as chloro, bromo, and carboxyl substituents, were satisfactory, and of these, 2-nitroso-4-chlorophenol was best. The ternary complex contains 2-nitroso-4-chlorophenol, iron (II) and rhodamine B in the ratio 3:1:1, and can be readily extracted into benzene. The red extracted complex shows maximal absorbance at 558 nm with a molar absorptivity of 90,000. Beer's law is obeyed over the range 0-0.00001 M iron (II); the pH range for extraction is 4.3-5.3, and the color is stable for at least 1 week. Interference studies with Na, K, Mg, Ca, ammonium, chloride, nitrate, sulfate, and carbonate ions showed that even 10-fold and 100-fold normal concentrations will not interfere with the ternary complex which can be quantitatively extracted into benzene. The application of the method to the determination of iron in potable and river waters is described. (Holoman-Battelle)

MULTIELEMENT INSTRUMENTAL NEUTRON ACTIVATION ANALYSIS OF BIOLOGICAL MATERIALS,
Cornell Univ., Ithaca, N.Y. Dept. of Chemistry.
R. A. Nadkarni, and G. H. Morrison.
Analytical Chemistry, Vol 45, No 11, p 1957-1960, September 1973. 2 tab, 29 ref.

Descriptors: *Pollutant identification, *Trace elements, Heavy metals, Chemical analysis, Plant tissues, Radioactivity techniques, Methodology, Alkali metals, Alkaline earth metals, Radioisotopes, Neutron activation analysis, Pollutants, Cobalt, Chromium, Copper, Iron, Manganese, Zinc, Molybdenum, Nickel, Sodium, Potassium, Magnesium, Calcium, Fluorine, Bromine, Phosphorus, Sulfur, Mercury, Beryllium, Lead, Cadmium, Aluminum, Chlorine, Strontium, Cesium, Arsenic radiosiotopes, Cadmium radioisotopes, Chlorine radioisotopes, Cobalt radioisotopes, Iodine radioisotopes, Potassium radioisotopes, Strontium radioisotopes, Zinc radioisotopes.
Identifiers: *Instrumental neutron activation analysis, *Biological samples, *Multielemental analysis, Animal tissues, Accuracy, Rare earth elements, Biological materials, Liver, Selenium, Vanadium, Barium, Silver, Arsenic, Antimony, Lithium, Bismuth, Rubidium, Lanthanum, Lutetium, Ytterbium, Scandium, Europium, Detection limits, Orchard leaves.

An INAA method capable of determining up to 36 elements, including many of the essential and toxicological trace elements is described. Since no chemical processing is involved, volatile elements such as As, Br, Cl, Hg, Se, and Sb are not lost in the method. Also, no chemical yields need to be determined for each of the elements determined. The method uses a multielement biological standard during irradiation which is similar in matrix element composition to the samples analyzed. This minimizes differences in neutron self-shielding and absorption effects between the standard and samples, as well as eliminates the task of preparing a large number of synthetic standards. With regard to the capability of determining the essential elements in biological materials, the INAA method has successfully measured Co, Cr, Cu, Fe, Mn, Mo, Se, Zn, Ni, V, Na, K, Mg, and Ca. Because of adverse nuclear properties F, B, P, and S cannot be measured using thermal neutron activation analysis and gamma spectrometry. Iodine and Sn could not be measured in these samples because they are present below the detection limit of the method. Of the toxicological elements, Ba, Ni, Ag, Hg, As, Sb, and Br can be measured by this method. Li, Be, Pb, and Bi cannot be measured because of adverse nuclear properties, and Cd in these samples is below the detection limit. Finally, the INAA method can also determine Al, Rb, Cl, Sr, La, Lu, Yb, Sc, Cs, and Eu in biological samples. (Holoman-Battelle)

SALTING-OUT OF ACETONE FROM WATER -BASIS OF A NEW SOLVENT EXTRACTION SYSTEM,
Kentucky Univ., Lexington. Dept. of Chemistry.
C. E. Matkovich, and G. D. Christian.
Analytical Chemistry, Vol 45, No 11, p 1915-1921, September 1973. 3 fig, 5 tab, 38 ref.

Descriptors: *Salts, *Halides, *Separation techniques, *Aqueous solutions, Solvent extractions, Chemical precipitation, Radioactivity techniques, Calcium chloride, Chemical analysis, Solutes, Calcium hydroxide, Calcium carbonate, Calcium sulfate, Copper sulfate, Magnesium hydroxide, Sodium sulfate, Ammonia, Sodium chloride, Cations, Anions.
Identifiers: *Solvent extraction systems, *Acetone, Organic solvents, Chemical recovery, Metal chelates, Magnesium chloride, Sucrose.

Seventy-nine compounds have been investigated as possible salting-out agents for the separation of acetone from aqueous solutions and its use for solvent extraction of metal chelates. Saturated aqueous salt solutions were prepared from ACS reagent grade chemicals at room temperature and allowed to sit with intermittent agitation for at least 7 days at room temperature before experimentation. Reagent grade acetone was used and Karl Fischer titrations were used to determine the amount of water present in the acetone. Atomic absorption spectrophotometric and radioactivity techniques were used in determining the best salting-out agents. Three of the compounds, calcium chloride, magnesium chloride, and sucrose, were superior in that they were efficient salting-out agents, were not strong complexing agents, their pH could be readily adjusted, and they did not react with many commonly used chelating agents. The solvent extraction of the cobalt-1-pyrrolidinecarbodithioate chelate using calcium chloride as the salting-out agent has been demonstrated using radiotracers. Acetone separated from saturated calcium chloride solution contained 0.321 plus or minus 0.011 percent water (v/v) and 212 ppm salt (wt/v) at equilibrium. Equilibrium was achieved in 2 hr, but could be reached rapidly by centrifuging for 3 min. (Holoman-Battelle)

Identifiers: *South Atlantic Slope Basins, *Eastern Gulf of Mexico Basins.

Quality of surface waters are presented for the South Atlantic Slope and Eastern Gulf of Mexico Basins for the 1968 water year (Oct. 1967-Sept. 1968). The Geological Survey has published annual records of chemical quality, water temperature, and suspended sediment since 1941. The records are listed by drainage basins in a downstream direction along the main stream. The mineral con-

stituents and physical properties of natural waters reported in the tables of analyses include those that have a practical bearing on water use. The results of analyses generally include silica, iron, calcium, magnesium, sodium, potassium, carbonate, bicarbonate, sulfate, chloride, fluoride, nitrate, boron, pH, dissolved solids, and specific conductance. Aluminum, manganese, color, acidity, dissolved oxygen, and other dissolved constituents and physical properties (including temperature and sediment yield) are reported for certain streams. Microbiologic (coliforms) and organic components (pesticides, total organic carbon) and minor elements (arsenic, cobalt, cadmium, copper, lead, mercury, nickel, strontium, zinc, etc) are determined occasionally for some streams in connection with specific problems and the results are reported. The source and significance of the different constituents and properties of natural waters are discussed. (Woodard-USGS)

SILICA-CARBONATE ALTERATION OF SERPENTINE: WALL ROCK ALTERATION IN MERCURY DEPOSITS OF THE CALIFORNIA COAST RANGES,
Geological Survey, Menlo Park, Calif.
I. Barnes, J. R. O'Neil, J. B. Rapp, and D. E. White.
Economic Geology, Vol 68, No 3, p 388-398, May 1973. 2 fig, 8 tab, 29 ref.

Descriptors: *Chemical reactions, *Geochemistry, *Water chemistry, *Carbon dioxide, *California, Coasts, Geology, Rocks, Groundwater, Silica, Carbonate rocks, Mercury, Analytical techniques, Rock properties, Geologic formations.
Identifiers: *Serpentine alteration.

Chemical, isotopic, and thermodynamic properties of CO2-rich groundwaters have been measured in the central California Coast Ranges. The acidic CO2-rich waters react with serpentine to form silica-carbonate rock, the host rock of many mercury deposits in the Coast Range of California. In part the waters are of a metamorphic origin and in part the waters are locally derived meteoric waters. The CO2 is entirely derived from metamorphic reactions at depth. Depending on the relative importance of several reactions, the relative abundances of silica and carbonate minerals vary in the silica-carbonate rock. If the CO2-rich fluids react directly with peridotite or dunite, massive magnesite deposits may form. (Woodard-USGS)

PREPARATIVE FREE-FLOW ELECTROPHORESIS AS A METHOD OF FRACTIONATION OF NATURAL ORGANIC MATERIALS,
Geological Survey, Washington, D.C.
J. A. Leenheer, and R. L. Malcolm.
Available from GPO, Washington, D.C. 20402 Price $0.35. Geological Survey Water-Supply Paper 1817-D, 1973. 14 p, 9 ref.

Descriptors: *Electrochemistry, *Organic compounds, *Electrophoresis, Separation techniques, Surface waters, Groundwater, Soil water, Electrodialysis, Ion transport, Water quality control.
Identifiers: *Fractionation.

Preparative free-flow electrophoresis was found to be an efficient method of conducting large-scale fractionations of the natural organic polyelectrolytes occurring in many surface waters and soils. The method of free-flow electrophoresis obviates the problem of adsorption upon a supporting medium and permits the use of high potential gradients and currents because of an efficient cooling system. Separations were monitored by determining organic carbon concentration with a dissolved carbon analyzer, and color was measured by absorbance at 400 nanometers. Organic materials from waters and soils were purified by filtration, hydrogen exchange, and dialysis and were concentrated by freeze drying or freeze concentration. In electrophortic fractionations of natural organic materials typically found in surface waters and soils, color was found to increase with the charge of the fraction. (Woodard-USGS)

SIGMA-INDUCTIVE MODEL VS. FIELD MODEL. OBSERVATION OF A REVERSED ATTENUATION EFFECT,
Georgia Inst. of Tech., Atlanta. School of Chemistry.
C. L. Liotta, W. F. Fisher, E. L. Slightom, and C. L. Harris.
Journal of the American Chemical Society, Vol 94, p 2129-2130, 1972. 1 fig, 2 tab, 11 ref. OWRR B-049-GA (2). NSF Grant No. GP 14437.

Descriptors: *Water chemistry, *Aqueous solutions, *Synthesis, *Chemical reactions, Analytical techniques, Model studies, Operations research, Organic compounds, Hydrogenation, Hydrolysis, Organic acids, Correlation analysis, Evaluation.
Identifiers: Organic base values, Reversed attenuation effect.

Many attempts have been made to distinguish between and evaluate the relative importance of the sigma-inductive and field models of reversed attenuation effects. Perhaps the strongest qualitative evidence for the operation of field effect is the observation of the angular dependence of substituent effects. Several studies involving direct comparison of rigid model systems provide more quantitative evidence for the superiority of the field model in describing the propagation of nonconjugative substituent effects. The first unambiguous example is reported of a reversed attenuation effect--an observation which questions the very foundation of the sigma-inductive model. The field model adequately accounts the experimental facts. Some 5-and 6-hydroxybicyclo- (2.2.2)octane-2-carboxylic acids were synthesized and their pKa values determined in 50% (by weight) aqueous ethanol at 25 deg. The data are summarized. In each of these cases both the substituent and the reaction center are, to a good approximation, in the same steric environment. This implies that the steric approach of solvent molecules to these centers is approximately the same in the three cases. (See also W73-00324)

Journal of the American Chemical Society, Vol 94, p 4891-4897, 1972. 6 fig, 6 tab. OWRR B-049-GA (3). NSF Grant GP 14437.

Descriptors: *Water chemistry, *Aqueous solutions, *Chemical reactions, *Electrochemistry, Polarity, Acids, Alkalis (Bases), Analytical techniques, Organic acids, Temperature, Model studies, Correlation analysis, Evaluation.
Identifiers: Dissociation constants.

The pKa's of eight 6-substituted spiro (3.3) heptane-2-carboxylic acids in 50% (by weight) aqueous ethanol at 25 C are presented. Excellent correlation is obtained between the experimental data and sigma-inductive parameters, whereas only a fair correlation is obtained using the Dewar-Grisdale F parameters. The data are also analyzed by means of the Tanford modification of the Kirkwood-Westheimer cavity model. Excellent agreement between calculated and experimental results is obtained with the spherical cavity model as well as with Stock's modification of this electrostatic model. An analysis is presented which demonstrates that hydrogen and methyl substituents do not exhibit anomalous behavior when compared to more polar substituents by means of the cavity models. Analysis of the limiting models for the propagation of nonconjugative substituent effects (sigma-inductive and field) suggests that the field model is more reliable in explaining the data. CALCIUM CARBONATE CEMENTATION OF ALLUVIAL FANS IN SOUTHERN NEVADA,
Cincinnati Univ., Ohio. Dept. of Geology.
L. H. Lattman.
Geological Society of America Bulletin, Vol 84, No 9, p 3013-3028, September 1973. 10 fig, 1 tab, 15 ref.

Descriptors: *Alluvial fans, *Carbonates, *Soil formation, *Calcium carbonate, *Nevada, Diagenesis, Alluvium, Geomorphology, Chemical precipitation, Mineralogy.

Several types of calcium carbonate cement occur on alluvial fans in southern Nevada. Secondary calcium carbonate deposits of pedogenic origin begin as coatings on pebble-size and larger clasts, and progress through calcic horizons to petrocalcic horizons and laminar layers. Nonpedogenic deposits include some laminar layers, gully-bed cementation, and case hardening. The extent and development of cementation are greatest on fans composed of carbonate and basic igneous rock detritus, less on fans built of siliceous sedimentary detritus, and least on fans composed of acid igneous rock material. In a single fan, the best-developed cementation is in the poorly sorted layers of alluvium containing more than 25% material coarser than pebbles. The major source of calcium carbonate deposited on noncarbonate fans is apparently wind-blown silt and sand and, as a result, fans of noncarbonate detritus are best cemented downwind of playas high in carbonates. TIDAL CURRENTS AND ZIG-ZAG SAND SHOALS IN A WIDE ESTUARY ENTRANCE,
Old Dominion Univ., Norfolk, Va. Inst. of Oceanography.
John C. Ludwick.
Available from the National Technical Information Service as AD-755 735, $3.00 in paper copy, $1.45 in microfiche. Technical Report No. 7, January 1973. 112 p, 22 fig, 9 tab, 56 ref, 3 append. NOOO14-70-C-0083.

Descriptors: *Estuaries, *Sediment transport, Sand bars, *Deposition (Sediments), Sedimentation, *Coasts, *Tidal effects.
Identifiers: *Coastal processes, *Tidal currents, Sand shoals, Chesapeake Bay, Ebb flow, Flood flow, *Tial flushing.

Fourteen 27-hour tidal current stations were occupied in the entrance to Chesapeake Bay in a 40-square mile area of subtidal sand banks and channels where the average water depth is 21 feet. Near the bottom at most stations, flood flow dominates over ebb flow in both peak speed and duration. Velocity profiles from bottom to surface are fitted by a parabolic-shaped velocity defect law from which shear stress at the bed was estimated. With two exceptions, net transport of bed sediment is ebb-directed. Decrease in net sediment transport rate along the path of net motion requires deposition of sediment. Locations of deduced deposition correspond to shoals. Prominent indentations, or sinuses, in the margins of shoals, are strongly dominated by net sediment transport towards the closed end of a channel. Zig-zag shoals extend from the north cape, three-fourths of the distance to the south across the entrance. This line of shoals is comprised of oppositely-opening sinuses, or parabolas, which are with distance to the south alternately ebb-dominated and flood-dominated. The shoals represent spit building action in the presence of strong reversing tidal currents. Other shoals in the entrance are due to subaqueous levee building marginal to main channels. Still other shoals in the entrance are constructed when a flood-dominated channel intersects the ebb-directed path of net sediment transport, the entrapped sediment then being flushed landward to form a secondary shoal when spreading of the flood current occurs. WAVE INDUCED CIRCULATION AND LONGSHORE CURRENT PATTERNS IN THE COASTAL ZONE,
Tetra Tech, Inc., Pasadena, Calif.
E. K. Noda.
Available from the National Technical Information Service as AD-750 291, $3.00 in paper copy, $1.45 in microfiche. Report no. TETRAT-P-72-149-3, September 1972. 109 p, 23 fig, 15 tab, 11 ref. 2 append. ONR-NOOO14-69-C-0107.

Descriptors: *Ocean currents, Mathematical models, *Ocean waves, Computer programs, *Coasts, *Beaches, Hydrodynamics.
Identifiers: Coastal zone, *Coastal topography, *Beach profiles, Bottom topography, Momentum flux, Surf zone, *Beach processes, *Near shore processes, *Near shore circulation, Wave incidence.

A theoretical analysis is presented on the generation and stabilization of nearshore, wave-induced circulation and longshore current patterns produced by the interaction of the incoming waves and local bottom topography. This interaction results in a spacial variation of wave characteristics which produces the driving mechanism for nearshore circulation patterns. Both normal and oblique wave incidence are considered with the imposed beach profiles developed from an examination of prototype data. The analytical model results are compared to field measurements and yield optimistic results. (Sinha-OEIS)

A COMPUTER PROGRAM TO ESTIMATE THE COMBINED EFFECT OF REFRACTION AND DIFFRACTION OF WATER WAVES,
Texas A and M Univ., College Station. Coastal and Ocean Engineering Div.
H. W. Worthington, and J. B. Herbich.
Available from the National Technical Information Service as PB-194 668, $3.00 in paper copy, $1.45 in microfiche. Sea Grant Publication TAMU-SG-70-219, August 1970. 57 p, 10 fig, 2 tab, 17 ref, 3 append. Grant: NSF-GH-59.

Descriptors: Harbors, *Waves (Water), *Computer programs, *Breakwaters, *Refraction (Water waves).
Identifiers: REDSEA, *Coastal processes, *Near shore processes, *Difffraction (Water waves), Shoaling.

Phenomena are reviewed which generally affect water waves entering a harbor, and the traditional methods of calculating the effects of the 3 principal phenomena - refraction, diffraction and shoaling are discussed. The utility of harnessing the capability of the computer to make the required calculations is illustrated. A computer program is presented which estimates the effects of refraction and diffraction as they combine to change the direction and height of water waves. A unique feature of the program, referred to as

'REDSEA', is that it considers the degree of reflection from the breakwater in calculating the diffraction coefficients. The validity of the predicted results is established by comparing them to experimental data obtained in connection wih this study as well as data from a similar study conducted previously. Applications of the program to design and analysis problems are discussed. (Sinha-OEIS)

GRAVITATIONAL CIRCULATION IN STRAITS AND ESTUARIES,
Washington Univ., Seattle. Dept. of Oceanography.
D. V. Hansen, and M. Rattray, Jr.
Journal of Marine Research, Vol 23, No 2, p 104-122, May 1965. 11 fig, 1 tab, 22 ref. NSF-GP-1101, GP-3549. NONR-477 (10), NONR-477 (37).

Descriptors: *Estuaries, Salinity, Circulation, Ocean circulation, *Straits, Density, Turbulence, Dispersion, Pollutants, Mixing, Tides, Currents (Water).
Identifiers: *Boundary conditions, Similarity solutions, Flushing.

Solutions are presented of the basic differential equations for the central and inner regimes of estuaries; both forced and free convections are considered, and two-dimensional salinity distributions are derived from external parameters. A coupled set of partial differential equations and associated boundary conditions is written to describe circulation and salt-flux processes for estuaries in which turbulent mixing results primarily from tidal currents. Similarity solutions, motivated by characteristic salinity distributions observed in estuaries, are obtained for this set of equations and are compared with observational data. The circulation is separated into modes analogous to the barotropic, baroclinic, and Ekman modes of oceanic circulation. The salinity distribution, although coupled to the velocity distribution, is found to vary independently of it as well. The theoretical results are discussed in regard to: (i) correlation between the vertical variations of mean velocity and salinity, (ii) the role of this correlation in maintaining the steady-state salinity distribution in estuaries, and (iii) some implications for computations of flushing and dispersion of contaminants. (Sinha-OEIS)
W74-00029

EFFECTS OF A NONRIGID, IMPERMEABLE BOTTOM OF PLANE SURFACE WAVES IN SHALLOW WATER,
Texas A and M Coll., College Station.
H. G. Gade.
Journal of Marine Research, Vol 16, No 2, p 61-82, 1958. 12 fig, 5 ref.

Descriptors: *Shallow water, Mathematical models, Friction, Energy loss, Mud, Sediments, Waves (Water), Energy, Bottom sediments.
Identifiers: *Coastal processes, Nonrigid bottoms.

Mutual effects of progressive wave motion in shallow water and in underlying fluid sediments are discussed, with emphasis on modification of the surface wave. The mathematical model is a layer of inviscid fluid overlaying a viscous fluid of greater density and bounded by a horizontal rigid plane. Solutions for locally periodic, simple harmonic disturbances indicate that wave height decays exponentially with travelled distance. The rate of dissipation of energy in the lower layer is proprtional to (a) the wave energy, (b) the ratio of amplitudes at the interface and the surface, and (c) the sine of an angle closely related to the phase difference between profiles at the free surface and the interface. Comparison is made between typical values of water decay due to dissipation in a fluid bottom and that due to friction loss over a rigid sand bottom. Even in a relatively thin layer of mud the dissipation exceeds by far the energy loss due to bottom friction. (Sinha-OEIS)

Oregon State Univ., Corvallis.
H. F. Frolander.
Journal Water Pollution control Federation, Vol 36, No 8, p 1037-1048, August 1964. 7 fig, 2 tab, 14 ref. NONR 1286 (10). NSF GP 622.

Descriptors: Estuaries, *Spatial distribution, *Tidal effects, Zooplankton, Salinity, *Light penetration, Migration, *Turbidity, Water temperature, *Estuarine processes, Oregon, Rhode Island.
Identifiers: Yaquina Bay (Oregon), Narragansett Bay (Rhode Island).

Relationships between zooplankton populations and estuary characteristics are illustrated principally using data from two mid-latitude estuaries on the coasts of the United States; one is Yaquina Bay, Oregon, a landlocked estuary; the other is Narragansett Bay, Rhode Island, a relatively openmouthed estuary. Physical and chemical factors, such as temperature and salinity, set limits of survival and reproduction but, within these limits, the time of day and the relation of the organisms to light, as well as the phase of the tide, will impose additional limits on organisms' spatial distribution. The horizontal translocation of zooplankton organisms is particularly great in long, narrow and shallow estuaries, especially in estuaries with a large tidal prism. Even the phase of the moon is important. It affects tides and resulting differences in speed of tidal currents; the resulting turbidity effects limit light penetration and, thus, change diurnal migration patterns. The light of the moon itself may influence the diurnal migrations and thus, the spatial distribution of species. (Sinha-OEIS)

COASTAL PROCESSES AND LONG RANGE PLANNING,
Scripps Institution of Oceanography, La Jolla, Calif.
B. M. Brush, and D. L. Inman.
In: Marine Technology Society 8th Annual Conference Preprints, p 215-226, 1972. 6 fig, 12 ref. NOAA SG 2-35208.

Descriptors: Planning, Coasts, *Sediment transport, Sediments, Harbors, Beaches, *Shore protection, Coastal engineering, Management.
Identifiers: *Coastal processes, Coastal energy, Tidal power, Crater sink, *Beach stabilization, Sand ripples, Roughness elements, *Environmental impact, *Littoral processes, Circulation cells.

The topics of coastal management and coastal planning are more frequently in the public conciousness than heretofore. The recent decade has produced new insights into the physical processes of the coastal zone which are of value to policy making as well as to science. These developments now enable remedial methods to be undertaken. This includes existing technology, adaptable methods, and practical future design for retarding the potentially irreversible loss of priceless coastal features. A review of the scope of the interference of manmade works shows that it is difficult to deal with a coastal problem without considering all of the factors concerned. (Sinha-OEIS)

CLIMB OF A BORE ON A BEACH. PART I. UNIFORM BEACH SLOPE,
Brown Univ., Providence, R.I.
D. V. Ho, and R. E. Meyer.
Journal of Fluid Mechanics, Vol 14, No 2, p 305-318, October 1962. 6 fig, 11 ref. NONR 562 (07).

Descriptors: *Beaches, *Shallow water, *Bores, Fluid mechanics, Hydrodynamics, Tides, Slopes.
Identifiers: Similarity solutions, Directional singularity, *Near shore processes, *Coastal processes.

The shoreward travel of a bore into water at rest on a beach of uniform slope is studied to elucidate why, in a class of problems - mainly gas-dynamical ones involving non-uniform shock propagation - similarity solutions seem to act like magnets attracting other solutions. For the shallow-water problem, the real magnet is shown to be the shore singularity of the governing differential equations. The shore singularity of the solution is shown to be a directional singularity of the water acceleration, for a fairly wide range of conditions, and a rather detailed asymptotic approximation for the bore development near shore is deduced. (Sinha-OEIS)

SEASONAL VARIATIONS OF COASTAL CURRENTS OFF THE OREGON - NORTHERN CALIFORNIA COAST,
Naval Postgraduate School, Monterey, Calif.
W. F. Whitson.
Available from the National Technical Information Service as AD-749 077, $3.00 in paper copy, $1.45 in microfiche. Master's thesis, June 1972. 52 p, 13 fig, 4 tab, 17 ref.

Descriptors: *Coasts, *Currents (Water), *Upwelling, *Winds, Subsurface flow, *Climate, Ocean circulation, Shallow water, Oregon, California, Pacific coast region.
Identifiers: Surface jet, *Near shore processes, *Coastal processes, Pycnocline, Columbia River discharge, Pressure gradient, Volume transport, Geostrophic velocities, Baroclinic flow.

Seasonal longshore flow patterns are examined at four points along the Oregon-Northern California coast. Summer and winter activity is examined as far seaward as 25 nautical miles and as deep as 200 meters. Long-term mean hydrographic data are used to determine geostrophic velocities. A nearshore baroclinic southward flow is observed at each of the points during the summer. Winter currents are generally very small and largely barotrophic in nature. Seasonal volume transports are presented; corrected velocity profiles are also presented based on data from moored current meters. Qualitiative explantions of the observed phenomena are considered. (Sinha-OEIS)

W74-00037

LONG TERM CHANGES IN MARINE ECOSYSTEM: ECOLOGICAL RELATIONSHIPS BETWEEN TOMALES BAY AND ADJACENT SHELF WATERS,
University of the Pacific, Dillon Beach, Calif. Pacific Marine Station.
S. J. Marcus, R. S. Houston, and E. H. Smith.
Final Report, March 31, 1972. 50 p, 19 fig, 1 tab, 1 ref, 3 append. Proj. NR 104-931 ONR 00014-67-A-0291-0001.

Descriptors: Ecology, *Coasts, *Bays, Continental shelf, Data collections, *Upwelling, Marine fisheries, Ecosystems, Commerical fishing.
Identifiers: Tomales Bay, Density structure, *Coastal processes, *Near shore processes.

An offshore measurement capability was developed along with the initial stage of data collection in the region adjacent to Tomales Bay. Preliminary analysis indicates that several cycles of coastal upwelling having a period of 5 to 6 weeks were observed by sequential measurements during the fall and winter months of 1969-1970. A low-cost operational capability has been achieved for the study of detailed density structure of shelf waters. Results not only provide some understanding of the processes affecting Tomales Bay, but indicate a possible relationship of the density structure to the movements of commercially important fish in the area. EXPERIMENTAL HYDRODYNAMIC CALCULATION OF APERIODIC WATER-LEVEL FLUCTUATIONS IN ESTUARIES,
V. V. Ivanov, and Ye. P. Kotrekhov.
Soviet Hydrology: Selected Papers, No 4, p 354-362, 1971. 4 fig, 9 ref. Translated from Problems of the Arctic and Antarctic (Problemy Arktiki i Antarktiki), No 38, p 45-55, 1971.

Descriptors: *Estuaries, *Water level fluctuations, *Frequency, *Hydrodynamics, Unsteady flow, Waves (Water), Wind tides, Surges, Channel morphology, Discharge (Water), Cross-sections, Profiles, Equations.
Identifiers: *Yenisey River estuary (USSR).

Level fluctuations in estuaries depend on aperiodic and periodic sea level fluctuations and variations in river runoff. Using the Yenisey River as an illustration, hydrodynamic equations of unsteady flow were applied to the calculation of wind tides in an estuary reach typical of estuaries of large Siberian rivers. To study propagation of wind-induced level fluctuations in the Yenisey estuary, a large number of surges were calculated on the M-220 computer. Results are presented of calculations for one flood and ebb wave dexcribed by stage observations at a number of gaging stations and by discharge measurements. Hydromorphometric characteristics of the Yenisey River estuary are graphed for an average discharge of 20,100 cu m/sec and average sea level. (Josefson-USGS)

PATTERNS OF SEDIMENT TRANSPORT AT NEARSHORE ZONES INFLUENCED BY WAVE AND TIDAL CURRENTS: A STUDY UTILIZING FLUORESCENT TRACERS,
Skidaway Inst. of Oceanography, Savannah, Ga.
G. F. Oertel.
Southeastern Geology, Vol 15, No 2, p 77-92, July 1973. 6 fig, 14 ref. USACE Contract DACW 72-68-C-0030, NSF Grant GA-30565.

Descriptors: *Beaches, *Sediment transport, *Waves (Water), *Tides, Surf, Sedimentation, Sedimentary structures, Sedimentology, Surges, Littoral drift, Currents (Water).

In nearshore zones, responses of detritus to moving water illustrate several different transportational and depositional patterns depending on the nature of the interactions between wave surge and tidal flow. At offshore, shallow, subtidal areas the greatest distances of sediment transport generally correspond to the direction of tidal flow, while bedform configurations are predominantly effected by wave surges. At offshore intertidal areas, bedform configurations and the greatest distances of sediment transport are largely controlled by surging waves. During the flooding tide, the approach directions of surging waves determine the bedform configurations and the greatest distances of sediment transport. When wave surge and tidal currents are in opposing directions (during the ebbing tide), sediment is entrained in gyral paths. These sediment gyres cause deposition of sand in the horizontal strata of planar beds. At the shorelines adjacent to the estuary entrances, tidal currents and wave currents are in mutually evasive zones and patterns of sediment entrainment generally conform to the directions of the water flow in the respective zones. When tidal currents and longshore currents are in opposite directions, then the entrainment of sediment corresponds to the bipolar flow directions in the respective current zones. (Knapp-USGS)

TIDAL RELATIONS ALONG THE INTRACOASTAL WATERWAY, PALM BEACH, COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
J. J. Schneider.
Open-file Report 73021, 1973. 22 p, 6 fig, 2 tab, 4 ref.

Descriptors: *Tides, *Inland waterways, *Florida, *Tidal waters, *Water level fluctuations, Diurnal, Sea level, Ocean currents, Data collections, Time.
Identifiers: *Tidal data, *Palm Beach County (Fla.), High tide, Low tide, Tidal range, Tidal time difference, Intracoastal waterway.

Prior to this investigation there was little tidal data for the Intracoastal Waterway in Palm Beach County, Florida. The purpose of this study, therefore, was to determine for this reach of the waterway: (1) mean high water; (2) mean low water; (3) mean sea level; (4) mean half tide; (5) mean tidal range; and (6) average tidal time difference, and to relate these values to the ocean tides at Miami Beach. From September 1, 1971 through August 31, 1972, mean high water along the Intracoastal Waterway in Palm Beach County ranged from 1.71 to 1.87 feet above mean sea level, datum of 1929. The mean tidal range varied from 2.33 to 2.69 feet. The difference between half tide and mean sea level varied between -0.01 foot at Delray Beach to +0.05 foot at Juno Beach with a zero variation at Southern Blvd. and Blue Heron Blvd. The average time difference for high tides referred to Miami Beach, ranged from plus 20 minutes at Riviera Beach to plus 1 hour and 50 minutes at Delray Beach. (Woodard-USGS)

LAND USE AS A FACTOR IN COASTAL WATER QUALITY,
California Univ., Berkeley.
P. H. McGauhey.
In: Proceedings of 13th Coastal Engineering Conference, July 10-14, 1972. Sponsored by Coastal Engineering Research Council and Waterways, Harbours and Coastal Engineering Division. p 2091-2097 (1972).

Descriptors: *Land use, *Water quality, *Coasts, Hawaii, Estuaries, Seashores, Urbanization, Water pollution effects, Water quality control, Standards, Institutional constraints, Social aspects.
Identifiers: *Coastal zone.

More knowledge of land use, development, and management practices is needed to ascertain their effect on coastal waters. It is also necessary to know enough about natural shifts in ecosystems and what kind of ecosystems should be maintained, or can be maintained, to make intelligent tradeoffs between land and water quality decisions. Reexamination should be made of degree of freedom that goes with the land to adapt it to a population load now bringing these waters to a condition of great concern. A Hawaiian study is developing criteria to relate coastal water quality to land management practices and to evaluate coastal zone resources both landward and seaward

of the shoreline. This affords an opportunity to establish some baseline against which to evaluate human activity on land--a need that can not be overemphasized. There are situations such as Kaneohe Bay where intense urbanization of a coastal valley has occurred, and changes in water quality and biota have been observed in the presence of treated sewage. Plans to discharge sewage elsewhere are in progress and the opportunity is developing to observe changes in the environment and in the biota when only urban runoff afflicts the waters. (Jones-Wisconsin)

AN EVALUATION OF MIXING IN THE TAY ESTUARY,
East of Scotland Water Board, Invergowrie (Scotland).
J. R. West, and D. J. A. Williams.
In: Proceeding of 13th Coastal Engineering Conference, July 10-14, 1972, Sponsored by Coastal Engineering Research Council and Waterways Harbours and Coastal Engineering Division. p 2153-2169 (1972). 9 fig.

Descriptors: *Mixing, *Estuaries, *Mathematical models, *Salinity, *Dispersion, Tidal effects, Flow characteristics, Saline water intrusion.
Identifiers: *Firth of Tay (United Kingdom).

A one dimensional form of the solute mass balance equation to obtain a mathematical representation of salinity distribution in the Tay Estuary (United Kingdom) is described. An apparent coefficient of dispersion and a net mixing term are defined, evaluated, and correlated to fluvial discharge and distance along the estuary. Reference is made to the proper reduction of dimensionality and time averaging of the instantaneous three dimensional solute mass balance equation. The conditions of significant tidal variation of both channel cross sectional area and solute concentration are recognized. This equation is a useful preliminary approach to the study of mixing in an estuary. While unsatisfactory from a physical point of view, the introduction of an apparent dispersion coefficient provides, along with other functions, an algebraic representation of the effects of processes that lead to what is here called the net mixing. The yield of physical information is limited to an estimate of the net effects of the physical processes of solute transport over a tidal cycle. In the Tay Estuary the apparent dispersion coefficient and net mixing are highly dependent upon distance along the estuary and mean river flow. (Jones-Wisconsin)

A NUMERICAL MODEL OF THE ST. LAWRENCE RIVER,
National Research Council of Canada, Ottawa (Ontario). Hydraulics Lab.
D. Prandle.
In: Proceedings of 13th Coastal Engineering Conference, July 10-14, 1972, Vancouver, B.C., Sponsored by Coastal Engineering Research Council and Waterways, Harbours and Coastal Engineering Division, p 2291-2305 (1972). 8 fig.

Descriptors: *Estuaries, *Mathematical models, *St. Lawrence River, Tidal effects, Flow characteristics, *Canada, Water levers, Velocity, Tides, Analytical Techniques.

A combined one and two-dimensional model of a 340-mile section of the St. Lawrence River was formulated, employing an explicit finite difference solution. A half mile square grid was used to schematize an area approximately 20 miles long by 15 miles wide. The two-dimensional model was embodied within the one-dimensional model permitting free interaction of flow across the boundaries. By combining the two models an accurate simulation of a particular short reach of a river was achieved. This technique has widespread applications subject to limitations of the two-dimensional model. The problem of flow visualization associated with numerical models was examined. For the one-dimensional model use of contours to represent water elevation plotted against time and distance along the river was found extremely useful. For the two-dimensional model animation techniques were used. A movie film was made that demonstrates both tidal rise and fall and associated horizontal velocities. Elevation was reproduced by use of colored paper to simulate contours, velocities were represented by simulating drogue movement to produce smoke streaks. (Jones-Wisconsin)

ANALYTICAL MODELING OF ESTUARINE CIRCULATION,
Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
J. S. Fisher, J. D. Ditmars, and D. R. F. Harleman.
In: Proceedings of 13th Coastal Engineering Conference, July 10-14, 1972, Vancouver, B.C., Sponsored by Coastal Engineering Research Council and Waterways, Harbours and Coastal Engineering Division, p 2307-2317 (1972). 2 fig.

Descriptors: *Analytical techniques, *Mathematical models, *Estuaries, *Circulation, Distribution, Salinity, Velocity, Tidal effects, Equations, Flow, Freshwater, Shoals.

A two-dimensional analytical model of estuarine circulation including vertical and longitudinal distributions of velocity and salinity is developed. Relationships between the various time-averaged coefficients of turbulent diffusion and eddy viscosity are included and gross parameters of estuarine circulation obtained. Flow is assumed laterally homogeneous and the estuary width and depth are assumed to be functions of the longitudinal coordinate only. Salt intrusion length, ocean boundary salinity, distribution of depth-averaged salinity and freshwater discharge are required inputs to the model. The vertical and longitudinal equations of motion, continuity, salt conservation and an equation of state are the governing equations included. The key assumption is made that longitudinal salinity gradient is independent of depth. This decouples these equations and thus permits an analytical solution. The model solutions, from data of laboratory flume and field surveys, are used to find correlations for the mean vertical transfer coefficients of mass and momentum with gross characteristics of the estuary. These correlations, plus results from a one-dimensional numerical model, permit this analytical model to be used as predictor of velocity and salinity profiles in estuaries and to relate changes in freshwater discharge to possible changes in the location of shoaling zones. SEMIDIURNAL INTERNAL TIDES IN MASSACHUSETTS BAY,
National Oceanic and Atmospheric Administration, Seattle, Wash. Pacific Oceanographic Labs.
D. Halpern.
Journal of Geophysical Research, Vol 76, No 27, p 6573-6584, September 20, 1971. 7 fig, 3 tab, 31 ref.

Descriptors: Temperature, *Gravity waves, *Bays, *Coasts, Massachusetts, Measurement, Tidal waters.
Identifiers: *Massachusetts Bay, *Internal tides, *Temperature measurement, Tidal cycles, Wave energy.

Semidiurnal tidal internal gravity waves consisting of the first five modes account for over 50% of the fluctuations that occurred in temperature measurements made at fixed depths in Massachusetts Bay. The amplitude of the lowest mode is the largest, while that of the second mode is negligible. The minimum value of the Richardson number of the internal wave of five modes is unity, and there is an indication that during each tidal cycle a dynamic instability may occur. The total internal wave energy occurring in a bandwidth of .00732 cph, centered on the semidiurnal frequency, is approximately 430,000 ergs/sq cm, which is about 8.6% of the total energy of the barotropic tide. These results, which were deduced from linear theory, may not be entirely accurate because the asymmetry of the temperature trace suggests nonlinear wave profiles, and because of the possible presence of microstructure. WATER-LEVEL FLUCTUATIONS AND FLOW IN TIDAL INLETS,
National Engineering Science Co., Pasadena, Calif.
J. Van de Kreeke.
Journal of the Waterways and Harbors Division, American Society of Civil Engineers, Vol 93, No WW4, Proceedings Paper 5575, p 97-106, November 1967. 6 fig, 5 ref, append.

Descriptors: *Inlets (Waterways), Tides, *Water level fluctuations, Mathematical models, Coasts, *Australia, Equations.
Identifiers: *Tidal inlets, *Water motion, *Tasmania (Macquarie Harbour), Fresh water inflow.

Equations are derived to describe the water motion in a tidal inlet connecting the ocean with a relatively small basin. The boundary conditions considered are the ocean tide and fresh water inflow. No density effects are taken into account. A dimensionless resistance coefficient is introduced to express the influence of the inlet channel resistance on the water motion. A numerical method to solve the equations is presented. For a better physical insight, the analytic solution is presented for a simplified set of equations, in which the quadriatic resistance term is replaced by a linear term. It appears that after a certain transition period the water level fluctuations in the bay become steady, the 'steady state' fluctuations being independent of the initial conditions. Numerical computations are carried out for the inlet of Macquarie Harbour, Tasmania. The results, for a case in which no fresh water inflow is considered, are compared with the results obtained according to Keulegan's method and with the results obtained with the help of the simplified (linear) set of equations. They appear to be in close agreement. (Sinha-OEIS)

THE EQUATIONS OF MASS CONTINUITY AND SALT CONTINUITY IN ESTUARIES,
Johns Hopkins Univ., Md. Chesapeake Bay Inst.
D. W. Pritchard.
Journal of Marine Research, Vol 17, p 412-423, 1958. 3 ref.

Descriptors: *Estuaries, Mathematics, Tidal effects, Equations, Mass, Equation.
Identifiers: *Estuarine processes, *Mass continuity, *Salt continuity, Slack water, Phase difference.

Equations of mass (or volume) continuity and salt continuity are developed for the two- and one-dimensional estuary from the basic forms of these equations in three dimensions. The three cases of vertical, lateral, and sectional homogeneity are treated. Some misuses of the continuity concepts as applied to estuaries have appeared in recent literature. These are discussed. The effect of phase difference between tidal slack water and high tide on the nontidal drift in sectionally homogeneous estuaries is presented. (Sinha-OEIS)
W74-00510

CLASSIFICATION SYSTEM FOR ESTUARIES,
Norconsult A/S., Oslo (Norway).
B. Glenne.
Journal of the Waterways and Harbors Division, American Society of Civil Engineers, Vol 93, No WW1, Proceedings Paper 5084, p 55-61, February 1967. 5 fig, 8 ref.

Descriptors: *Estuaries, *Tidal effects, Mixing, Diffusion, *Classification, Friction, Stratification, Hydrology, *California, Coasts.
Identifiers: Advective flow, *San Francisco Bay.

An attempt is made to improve the communications between estuarine investigators by providing a classification system for natural occurring estuaries, based on readily measurable physical parameters. Because quantitative information regarding mixing processes is presently relatively sparse, the classification system is based mainly on hydrographical, tidal, and hydraulic parameters. The classification system is schematically pictured and quantitatively defined wherever possible. (Sinha-OEIS)
W74-00511

NATURAL INDICATORS OF ESTUARINE SEDIMENT MOVEMENT,
Oregon State Univ., Corvallis. Dept. of Oceanography.
J. V. Byrne, and L. D. Kulm.
Journal of the Waterways and Harbors Division, American Society of Civil Engineers, Vol 93, No WW2, Proceedings Paper 5220, p 181-194, May 1967. 8 fig, 3 tab, 14 ref. ONR Contract Nonr 1286 (10).

Descriptors: *Sediment transport, *Estuaries, *Beaches, Near shore, Bays, Tidal effects, Sedimentation, Runoff, *Littoral drift, Winds, *Oregon, Seasonal.
Identifiers: *Yaquina Bay (Ore.), *Near shore processes, Tidal currents, Onshore winds, Tidal flats.

Sediment movement within Yaquina Bay, Oregon, has been determined through the use of sediment texture and composition and related to the hydrography of the estuarine system. These natural indicators reveal at least two major sources of sediment - a river source and a beach or nearshore source. Marine sands are introduced into the bay by tidal currents or by onshore winds and transported upstream six miles from the bay entrance. Sands from the Yaquina River remain within the estuary while the suspended silts and clays are deposited primarily on tidal flats or carried out to sea on the ebb tide. Sedimentation in Yaquina Bay appears to be largely seasonal. Maximum deposition occurs during the winter and spring when river runoff is highest. During these seasons littoral drift, coastal winds, and estuarine hydrographic system promote the transport of beach or nearshore marine and dune sands into the estuary. During summer and fall, deposition is slight due to less favorable climatic and hydrographic conditions. (Sinha-OEIS)
W74-00512

INITIAL WAVE SCATTERING BY AN INHOMOGENEOUS MEDIUM AND ITS APPLICATION TO SHALLOW WATER WAVES,
Johns Hopkins Univ., Baltimore, Md. Dept. of Mechanics and Materials Science.
E. J. Katz.
Journal of Geophysical Research, Vol 67, No 12, p 4713-4719, November 1962. 1 fig, 6 ref. Nonr 248 (56).

Descriptors: *Shallow water, *Tsunamis, *Waves (Water), *Coasts.
Identifiers: *Near shore processes, *Wave scattering, Inhomogeneous medium.

The initial scattering of a scalar wave function by a statistically homogeneous medium is discussed for an unspecified, scattering, source distribution. The angular distribution of scattered energy and the attenuation of the incident wave energy are obtained which, in a three-dimensional space, yield Batchelor's earlier results. The comparison provides an estimate of the region included in his far field approximation. The present analysis is then applied to a class of scattering problems which includes the scattering of shallow water waves by a random depth. With the acid of a particular spectral function for the depth autocorrelation, an inadequacy of the single scattering technique (first Born approximation) is high-lighted for certain large-scale inhomogeneities. It is then quantitatively suggested that an important shallow ocean wave (a tsunami) cannot be studied by single scattering. (Sinha-OEIS)

FORMATION OF THERMAL MICROSTRUCTURE IN A NARROW EMBAYMENT DURING FLUSHING,
Washington Univ., Seattle. Applied Physics Lab.
J. T. Shaw, and G. R. Garrison.
Journal of Geophysical Research, Vol 64, No 5, p 533-539, May 1959. 6 fig, 2 ref.

Descriptors: *Thermal stratification, Seasonal, *Coasts, *Bays, *Washington.
Identifiers: *Puget Sound (Wash.), Flushing, Embayments, Temperature measurements, *Near shore processes, Isothermal diagrams.

Thermal microstructure formations, coincident with the occurrence of flushing in a narrow Puget Sound embayment, have been observed and measured with a high-sensitivity probe. Accompanying the larger formations which extend horizontally for thousands of yards, a microstructure is shown to exist which consists of elongated layers extending hundreds of yards with temperature differences of less than 0.1 degree C. Two series of isothermal diagrams constructed from vertical temperature measurements taken in the area during winter and summer flushing are presented to show the manner in which such formations are developed. (Sinha-OEIS)

WAVE REFRACTION PATTERNS IN HAWKE BAY,
Department of Scientific and Industrial Research, Wellington (New Zealand). Oceanographic Inst.
J. G. Gibb.
New Zealand Journal of Geology and Geophysics, Vol 5, No 3, p 435-444, August 1962. 6 fig, 1 tab, 6 ref.

Descriptors: *Waves (Water), *Refraction, *Shallow water, Surf, Harbors, *Coasts, *Bays.
Identifiers: Near Shore processes, *New Zealand (Hawke Bay), Snell's law.

When a wave originating in deep water enters shallow water, i.e., water whose depth is less than half the wavelength, the velocity of the wave is reduced. Refraction, i.e., the distortion of wavefronts by wave-velocity changes, will therefore occur when a wave-front enters shallow water. The process is analogous to the bending of light rays in optical systems, and the relations are expressed by Snell's law. Wave refraction diagrams are presented and discussed for Hawke Bay and for two nearshore areas within the Bay. Generally there are no marked refraction effects in the Bay as a whole, except near Cape Kidnappers and Portland Island. In the Napier Harbour area, Pania Rock and adjacent banks are the principal factors affecting the smooth pattern of wave fronts. For the Clifton-Awatoto area the direction of longshore currents produced by the refracted waves is shown to be predominantly northward. (Sinha-OEIS)

SALINITY OF INTERSTITIAL WATER IN A SANDY BEACH,
Chicago Univ., Ill. Dept. of the Geophysical Sciences.
R. G. Johnson.
Limnology and Oceanography Vol 12, No 1, p 1-7, January 1967. 1 fig, 3 tab, 12 ref.

Descriptors: *Salinity, Circulation, *Beaches, *Tidal effects, Bays, *Shallow water, Sands, *California.
Identifiers: *Tomales Bay (Calif), Intertidal sand, Tidal cycle.

The salinity in the upper 20 cm of intertidal sands was observed at two stations in Tomales Bay, California. In summer, there were no striking variations associated with elevation, except for the effect of evaporation. In winter, the influx of freshwater provides sufficient contrast between interstitial and open water to reveal features of circulation. High on the beach, the interstitial salinity at the 10- and 20-cm depth remains low through the tidal cycle. The salinity at 10 cm remains higher than at 20 cm. At an elevation of 1.0 m, the salinities at 10 and 20 cm converge. Below this elevation, interstitial salinity varies less than in the adjacent open waters of the bay. The environment of the infauna of the low intertidal zone is more stable than that of epifaunal or pelagic organisms in shallow water. The variations high in the intertidal zone must constitute a major obstacle to the spread of marine organisms into this area. (Sinha-OEIS)

TIDAL VARIATION OF THE SIZE DISTRIBUTION OF SUSPENDED SEDIMENT AT A STATION IN THE CHESAPEAKE BAY TURBIDITY,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
J. R. Schubel.
Netherlands Journal of Sea Research, Vol 5, No 2, p 252-266, 1971. 8 fig, 5 tab, 3 ref.

Descriptors: *Sedimentation, *Deposition (Sediments), *Estuaries, *Coasts, *Turbidity, Tidal effects, *Chesapeake Bay.
Identifiers: Suspended sediments, *Tidal cycle, Size distribution.

The results of sedimentation size analyses of samples collected over a tidal cycle at a station within the turbidity maximum of the Chesapeake Bay are presented. The suspended particle population consists of two sub-populations - those particles in more or less continual suspension throughout the water column, and those particles alternately suspended and deposited. The background particles (stable volume-size distribution) are derived in part directly from run off; and in part from primary productivity, from shore erosion, and from resuspension. These very fine-grained particles have a volume weighted mean settling velocity of the same order as the mean vertical mixing velocity. This appears to explain their narrow, stable size distribution, and their sustained suspension. (Sinha-OEIS)
W74-00525

A TEST OF MIXING LENGTH THEORIES IN A COASTAL PLAIN ESTUARY,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
R. E. Kent, and D. W. Pritchard.
Journal of Marine Research, Vol 18, No 1, p 62-72, June 30, 1959. 4 fig, 1 tab, 8 ref.

Descriptors: *Estuaries, Coasts, *Mixing, Density, *Stratification, Wind, Salinity, Circulation, *Virginia, *Coastal plains.
Identifiers: Estuarine processes, Wind waves, *Mixing length, James River estuary.

The purpose was to demonstrate that the mixing length associated with vertical diffusion of salt in a stratified estuary may be formulated in terms of the stability of the system and of an adiabatic mixing length determined by the geometry of the system. Observations of vertical and horizontal variations in salinity and velocity in the James River estuary have been previously employed in the indirect determination of the vertical eddy flux of salt (Pritchard, 1954). This term is employed here to compute a mixing length after the definition of Prandtl. It is shown that this observed mixing length is qualitatively similar to a theoretical one formulated from the geometry of the system and a stability parameter related to the density stratification of the system. Several alternate hypotheses regarding the theoretical mixing length are tested. Better quantitative agreement is obtained when the influence of surface wind waves is included in the formulation of the theoretical mixing length. (Sinha-OEIS)

EVALUATION OF THE RELIABILITY AND MAINTAINABILITY OF DESALTING PLANTS.
Hittman Associates, Inc., Columbia, Md.

Available from the National Technical Information Service as PB-221 121, $11.00 in paper copy, $1.45 in microfiche. Office of Saline Water, Research and Development Progress Report No 859, August 1972. 164 p, 48 ref, 29 tab, 47 ref. Contract 14-30-2848.

Descriptors: Standards, Distillation, *Desalination, Brines, *Flash distillation, Evaluation.
Identifiers: Product water, Water production, Heat rejection, *Reliability, *Maintainability.

Results are presented of applying reliability and maintainability engineering analysis techniques to the 2.5 MGD Universal Desalting Plant design for a multistage flash seawater distillation plant and evaluating the economics of applying these techniques in other programs. A 14 percent increase in predicted availablility, from 77 to 88 percent, results from design modifications to critical component areas. The modifications result in a 9 percent decrease in product water cost, from 140cent/1000 gallons to 128cent/1000 gallons. An interative analysis is defined for optimizing product water cost with respect to availability. A plan is presented for developing a formal reliability and maintainability engineering program in the Office of Saline Water. (OSW)

DESALINATION PROCESS,
Rohm and Haas Co., Philadelphia, Pa. (Assignee)
F. J. Glavis, and D. H. Clemens.
U.S. Patent No. 3,753,898, 4 p, 4 ref; Official Gazette of the United States Patent Office, Vol 913, No 3, p 948, August 21, 1973.

Descriptors: *Patents, *Desalination, Saline water, Potable water, *Polymers, *Polyelectrolytes, *Ion exchange, *Water treatment, Treatment.

Saline water is contacted with polyelectrolyte insoluble in acid solution. The polyelectrolyte is a cross-linked polymer having ion exchange properties. It has a glass transition temperature, i.e. a Tg, in the dry state of at least about 25 degrees C and up to about 65 degrees C. The polymer preferentially sorbs water from the saline water and forms a hydrate with it. The solute concentration in the remaining saline water is increased, removing the resulting hydrated polymer from the remaining saline water. The hydrated polymer is heated to at least 10 degrees C above the datum temperature and removes purer water from the polyelectrolyte. The purified water is thermally released from the polymer and the polymer is used over again. Cross-linked acrylic polymers are preferred. (Sinha-OEIS)

MEMBRANE PROCESSES (OSMOSIS AND REVERSE OSMOSIS),
Yugoslav Academy of Sciences and Arts, Dubrovnik. Inst. for Marine Corrosion and Desalination.
B. Kunst, G. Arneri, P. Goran, and A. M. Basnec.
Available from the National Technical Information Service as PB-219 393, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No 84, March 1973. 39 p, 10 fig, 14 tab, 7 ref. 14-01-0001-1427.

Descriptors: *Desalination, *Reverse osmosis, *Membrane processes, *Permselective membranes, *Osmosis, Sea water, Evaporation, Solvents.
Identifiers: Cellulose acetate.

The research has two main goals: (1) the development of more productive osmotic and reverse osmotic membranes for the sea water desalination, and (2) an optimal design of elements for osmosis and reverse osmosis units. Previous work on the general problem of making more productive reverse osmosis membranes resulted in new classes of porous cellulose acetate reverse osmosis membranes for low pressure work of highly increased (100%) productivities, as well as in a new concept on the mechanism of membrane formation, named solution structure - evaporation rate concept. In this concept the state or the struture of the casting solution and the rate of solvent evaporation during film formation together constitute important related variables governing the ultimate porous structure and hence the performance of the resulting membranes in reverse osmosis. Investigations were undertaken to further the understanding of the mechanism of the membrane formation process. Changes in reverse osmosis membrane performances caused by including another solvent, dioxane, as a substitution for a part of acetone in a casting dope were studied. Apparatus was constructed, built and tested for the solvent evaporation rate measurement. (OSW)

ION-SELECTIVE ELECTROCHEMICAL SENSORS,
Texas Instruments, Inc., Dallas.
I. Trachtenberg.
Available from the National Technical Information Service as PB-219 394, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No 844, March 1973. 104 p, 26 fig, 18 tab, 24 ref. 14-01-0001-1737.

Descriptors: *Desalination, *Electrodes, Water purification, Electrochemistry, Calcium, Magnesium, Sulfates, Iron, Copper, *Ion exchange.
Identifiers: *Ion selective electrodes, Nonoride glasses, *Sensors (Electrochemical).

Ion-selective electrochemical sensors can provide a means for rapidly determining and continuously monitoring the concentration of a variety of ionic species in aqueous solutions, particularly saline

and brackish waters. The development of novel ion-selective sensors was the goal of this research program. Specifically, the program goal was to develop inexpensive, chemically durable, and highly selective electrochemical sensors which would provide rapid and specific response to Fe+3, Cu+2, Ca+2, Mg+2, Na+, K+, and SO±4 in saline and brackish water. The primary approach was to investigate the use of nonoxide materials, both crystalline and amorphous, which, when fabricated into sensors, gave selective response to the specific ions of interest. The research program had four major parts: sensor material preparation; material characterization, including resistivity; sensor preparation and evaluation for ion selectivity; and sensor mechanism studies. METHODS FOR CONTROLLING MARINE FOULING IN INTAKE SYSTEMS,
Dow Chemical Co., Freeport, Tex.
D. C. Mangum, B. P. Sheperd, and W. F. McIlhenny.
Available from National Technical Information Service as PB-221 909, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No 858, June 1973. 124 p, 32 fig, 18 tab, 32 ref. 14-30-2829.

Descriptors: *Desalination, *Intakes, Intake structures, *Fouling, Economics, Heated water, Corrosion, Water quality control, *Chlorine.
Identifiers: *Intake systems, Chlorine control, Copper allow liners.

Principal marine fouling organisms along the Pacific, Atlantic, and Gulf Coasts of the United States have been identified. Various control methods have been experimentally evaluated on sea water. Control of fouling must be considered at all phases of desalting plant design, construction, and operation. Chlorine is the toxin of choice for most sea water intake systems. (OSW)

IMPROVED ETHYL CELLULOSE MEMBRANES FOR REVERSE OSMOSIS APPLICATION,
Gulf South Research Inst., New Orleans, La.
J. K. Smith, and E. Klein.
Available from the National Technical Information Service as PB-222 288, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No 863, January 1973. 35 p, 5 fig, 12 tab, 12 reg.

Descriptors: *Membranes, *Reverse osmosis, *Semipermeable membranes, *Permselective membranes, Permeability, *Desalination, Films, Mass transfer, Brackish water, *Polymers.
Identifiers: Ethyl cellulose membranes, Solubility parameters, Asymmetric membranes, Membrane casting variables, Tubular ethyl cellulose membranes.

Ethyl cellulose, a very chemically stable polymer has been studied for the formation of asymmetric membranes for reverse osmosis. A solution prediction model has been developed which allows the formation of asymmetric membranes from a larger number of solvent combinations. The data from both flat sheet and tubular asymmetric ethyl cellulose membranes reveal an outstanding stability to alkaline solutions, good rejections for most solutes but relatively low flux. The compaction of these membranes is of the same degree as cellulose acetate. (OSW)

NEW MEMBRANE COMPOSITIONS FOR DESALINATION OF WATER BY REVERSE OSMOSIS,
Monsanto Research Corp., Dayton, Ohio.
P. H. Wilken, A. J. Blardinelli, J. L. Schwendeman, I. O. Salyer, and L. E. Erbaugh.
Available from the National Technical Information Service as PB-220 145, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No 862, November 1972. 40 p, 2 fig, 12 tab.

Descriptors: *Membranes, *Reverse osmosis, *Permselective membranes, *Permeability, *Semipermeable membranes, *Desalination, Films, Membrane processes, Pressure, Separation techniques.
Identifiers: Ethylene/vinyl acetate copolymers, Vinyl alcohol/vinyl acetate copolymers, Acrylonitrile copolymers, Polyblends, Compression molding, Solution casting.

Dense membranes of acrylonitrile/methylvinylpyridine (50/50) compositions had excellent handling and processing characteristics and rejected 73% of sodium chloride from a 35,000 ppm feed stock at 1200 psig, at a flux of 0.23 gfd. Although the salt rejection is lower, the flux is more than double that of comparable membranes of cellulose acetate (95%, 0.1 gfd). 'Asymmetric' membranes prepared from 15% solutions of acrylonitrile/methylvinylpyridine copolymer in dimethylacetamide/glycerine (85/15) wer prepared. Coagulated membranes gave 80% rejection of sodium chloride (3.5%) at a flux of 1.6 gfd. In the vinyl acetate polymers and copolymers, the best salt rejection and flux was obtained in vinyl acetate/vinyl alcohol copolymers containing from 10 to 25% vinyl alcohol. Thin dense membranes in this range of vinyl alcohol content rejected 84% of sodium chloride (3.5%) at a flux of 0.1 gfd. (OSW)

DEVELOPMENT OF IMPROVED MEMBRANES FOR REVERSE OSMOSIS,
Hercules, Inc., Cumberland, Md. Allegany Ballistics Lab.
R. V. Cartwright, M. A. Grable, and B. M. Ruggleman.
Available from the National Technical Information Service as PB-221 699, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No 857, May 1973. 86 p, 5 fig, 14 tab, 18 ref. Contract 14-30-3011.

Descriptors: *Desalination, *Membrane processes, *Reverse osmosis, *Gels, *Polymers, *Permeability.
Identifiers: Crosslinking, Ultra-thin membranes, Polyethers, Cellulose ethers, Butadiene, Vinyl pyridine, Salt rejection.

The goal was to develop a new polymer for single-stage seawater conversion, that castable, high in performance and resistant to hydrolytic degradation. To this end, an investigation was made into three classes of hydrophilic polymers shown earlier to have promise for use in reverse osmosis membranes. The polymers, which include cellulosics, vinyl copolymers, and polyethers, were modified to effect water insolubility and to form structures which contained a high porportion of Lewis base functionality. Films of these materials were evaluated for water and salt permeability and performance in reverse osmosis. (OSW)

EVALUATION OF ASYMMETRIC HOLLOW FIBERS FOR DESALINATION BY REVERSE OSMOSIS,
Amicon Corp., Lexington, Mass.
D. S. Cleveland, M. Rambeau, A. Czernicki, and T. R. Rich.
Available from the National Technical Information Service as PB-221 654, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No 856, April 1973. 34 p, 4 fig, 4 tab, 1 ref. 14-30-3010.

Descriptors: *Desalination, *Reverse osmosis, Cellulose, *Membranes.
Identifiers: *Cellulose acetate, *Hollow fibers, Nomex, Polyacrylic acid, Polysulfone, Tubules, Burst pressure, Composite membranes, Spinnerette.

Asymmetric hollow fiber membranes with the discriminating skin on the inside of the fiber were prepared from aromatic polyamides (Nomex) and cellulose acetate. These fibers have an inside diameter of 0.018 in. and a wall thickness ranging from 0.002 in. to 0.007 in. Nomex fibers gave water flux rates of 20 GSFD at 40% magnesium sulfate and 20% sodium chloride rejection levels when tested with a 1500 ppm brackish feed brine. The burst pressure of these fibers averaged 150 psig. Initial attempts at producing cellulose acetate fibers resulted in fibers which exhibited very poor burst strength, less than 25 psig in most cases, and no NaCl rejection with very low salt concentrations. A secondary product of the project was a single fiber testing device which allowed screening of candidate fibers immediately after spinning, without having to wait for a module to be potted. (OSW)

TRANSPORT PROPERTIES OF CHARGE-MOSAIC MEMBRANES-PART A,
Harvard Medical School, Boston, Mass.
J. N. Weinstein, C. R. Gardner, and S. R. Caplan.
Available from the National Technical Information Service as PB-223 153, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No. 864, (October 1972). 48 p, 9 fig, 3 tab. 14-01-0001-2148.

Descriptors: *Membranes, *Ion transport, Osmosis, *Permeability, *Permselective membranes, Semipermeable membranes, *Desalination, Films, Thin films, Membrane processes, Pressure, Separation techniques.
Identifiers: Piezodialysis, Pressure dialysis, Nonequilibrium thermodynamic analysis, *Charge mosaic membranes, Polarization, Hydrodynamic model, Phenomenological coefficients, Concentration polarization.

A nonequilibrium thermodynamic analysis of piezodialysis is presented. For a charge-mosaic membrane in which circulating current constitutes the major contribution to salt flow, it is shown that the 'complete' local phenomenological coefficients are concentration-independent. Hence, upon integration, the flows may be expressed as linear functions of the global forces. The resulting expressions are used to predict the fractional recovery and rate of production of potable water in desalination by piezodialysis. An illustrative calculation is performed for a cylindrical tube (or hollow fiber) made from a hypothetical mosaic membrane whose properties have been calculated from those of Zeo-karb 315 cation exchange membrane. Perfect radial mixing and the absence of concentration polarization are assumed in order to focus attention on the role played by the membrane elements and circulating currents. For a 1 mm thick membrane the calculation shows an 81% recovery of potable water of 350 ppm from a brackish water feed of 1500 ppm, the rate of production being 23 gpd/sq ft. A thinner mosaic with a correspondingly reduced pattern size would give a proportionately higher production rate with no loss in recovery, provided that significant polarization could be prevented. This calculation sets upper limits on the performance of a given membrane by assuming that its properties, rather than the hydrodynamic conditions, are rate controlling. The analysis suggests ways of changing membrane properties to improve performance. (See also W74-00311) (OSW)

TRANSPORT PROPERTIES OF CHARGE-MOSAIC MEMBRANES - PART B,
Harvard Medical School, Boston, Mass.
J. N. Weinstein, B. J. Bunow, and S. R. Caplan.
Available from the National Technical Information Service as PB-223 153, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No. 864, (October 1972). 103 p, 19 fig, 8 tab. 14-01-0001-2148.

Descriptors: Membranes, *Ion transport, Osmosis, *Reverse osmosis, *Membrane processes, *Desalination processes, Separation techniques, Pressure semipermeable membranes, Permeability, Films.

Charge-mosaic membranes are currently being considered for a number of practical applications, most notably 'piezodialysis' desalination. In Part I of this series the properties of the charge-mosaic are subjected to a nonequilibrium thermodynamic analysis, with emphasis on the role of the electrical resistance in the solutions bathing the membrane. Four regimes of operation are delineated by the analysis: (i) membrane control, (ii) solution control, (iii) co-ion leakage control, and (iv) polarization control. The nonequilibrium thermodynamic analysis developed in Part I of this series was subjected to experimental test. Experiments were performed to evaluate a set of six independent transport coefficients characterizing the individual anion and cation exchange elements. The results were used in conjunction with calculated values of the solution conductances to predict the transport properties of the charge-mosaic as a whole. (See also W74-00310) (OSW)

NEW POLYMER MEMBRANE TECHNOLOGY FOR DESALINATION OF SEAWATER BY REVERSE OSMOSIS,
Union Carbide Corp., Bound Brook, N.J.
L. A. Pilato, L. M. Litz, J. E. McGrath, R. N. Johnson, and I. E. Kochevar.
Available from the National Technical Information Service as PB-222 996, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No. 867, March 1973. 40 p, 1 fig, 16 tab. 14-30-2985.

Descriptors: *Reverse osmosis, *Membranes, *Desalination, *Permselective membranes, Seawater, Saline water, Demineralization, Semipermeable membranes, Absorption, Pressure.
Identifiers: Hydrophilic heterocyclic monomers, Polysulfone, Poly (aryl ethers), Ethoxylation of Nylon 6, Water sorption.

The modification of poly (aryl ethers) by incorporation of heterocyclic hydrophilic monomers or amide containing monomers has improved their water uptake to values of 3-5% when compared to 0.69% for polysulfone, an unmodified poly (aryl ether). Attempts to increase the water sorption of the novel amide containing poly (aryl ethers) by ethoxylation were unsuccessful. Low water fluxes 1 x 0.0001 gal/sq ft-day (GFD) under reverse osmosis conditions (0.1% NaCl at 1500 psi) were generally observed for all novel poly (aryl ethers). Model studies designed to improve the reverse osmosis behavior of polyamides were conducted with nylon 6. Ethoxylated nylon 6's with ethylene oxide contents ranging from 1.4 - 6.5% afforded fluxes ranging from 0.3 - 1.7 gal/sq ft-day (GFD) and salt rejections ranging from 44-90%. Characterization of these systems indicated that polymer crystallinity decreased with increasing ethylene oxide content. Ethoxylation of Trogamid T, an amorphous alkyl polyamide, to levels up to 6% ethylene oxide afforded materials with low water flux. Ethoxylation of an aryl polyamide significantly increased water flux, but decreased salt rejection. (OSW)

DEVELOPMENT OF HIGH-FLUX HOLLOW REVERSE OSMOSIS FIBERS FOR BRACKISH WATER SOFTENING,
Monsanto Research Corp., Durham, N.C.
R. L. Leonard.
Available from the National Technical Information Service as PB-223 102, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No. 872, September 1973. 52 p, 8 fig, 21 tab, 4 ref. 14-30-3066.

Descriptors: *Membrane processes, *Desalinationprocesses, Desalination, *Reverse osmosis, *Water treatment, *Water softening, Pilot plants, Brackish water.
Identifiers: Hollow fine fiber modules, Cellulose acetate membranes.

This study involved additional development of asymmetric cellulose acetate hollow fibers and resulted in a brackish water desalting system for hardness removal and partial demineralization exhibiting fluxes of 8.5 gfd at 100 psig operating pressure. The fiber systems tested showed good stability with flux declines of less than one percent after 100 days of continuous operation. Two modules, an axial-flow and radial-flow unit, each in excess of 5000 gpd capacity were assembled and field tested on Webster, So. Dakota feedwater. The radial design unit, a six-inch diameter module with four-foot active length, produced 6000 gpd (70 deg F) with salt rejection of 92%, at 100 psig operating pressure. Design and construction work was also carried out on a third modular concept, the fiber bobbin cartridge, but this was not carried through to evaluation of a functional unit. (OSW)

RESEARCH ON COMPOSITE HOLLOW TUBULES,
DeBell and Richardson, Inc., Enfield, Conn.
B. Baum, R. A. White, H. Stiskin, and W. H. Holley, Jr.
Available from the National Technical Information Service as PB-222 977, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No. 865, March 1972. 88 p, 14 fig, 27 tab, 10 ref. 14-30-2784.

Descriptors: *Reverse osmosis, *Membranes, *Desalination, *Permselective membranes, Brackish water, Pressure, Semipermeable membranes, Permeability, Coatings.
Identifiers: *Polyvinyl chloride tubules, Porous supports, Asymmetric cellulose acetate, Ultrathin film barriers, Dynamically formed membranes, Polyacrylic acid membranes, Polyvinyl chloride films, Ultrathin polyethyleneimine/toluene diisocyanate films.

The work has consisted of preparing porous tubules, 0.030-0.060 inch diameter, and coating the outside of the tubules with reverse osmosis permselective barriers. Asymmetric cellulose acetate E-400-25 dissolved in formamide-acetone is the most promising coating, yielding very consistent results even when handled roughly. Initial results with this system were low in flux but this problem was solved by using more dilute cellulose acetate casting solutions. Tubulet fluxes of 14 to 15 gf2d at 800 psi and 1% NaCl were readily attainable. Salt rejections were 95-98%. Initial work with the dynamically formed membranes from zirconium oxide and polyacrylic acid showed promise (6-18 gf2d at 94 to 98% sodium sulfate rejection and 80-94% sodium chloride rejection at 950 psi). Preliminary work was carried out to develop a polysulfonic-zirconium oxide membrane which should be more resistant to fouling by divalent ions. Initial membranes gave low salt rejections (80%) but the system deserves further investigation. These dynamically formed systems have the advantage of in situ coating of the tubulets in the module. Work with ultrathin cellulose acetate, sulfonated PPO, polyethyleneimine-TDI, and polyacrylic acid coated directly on the porous tubulet with and

without pore fillers gave only 0-40% rejection. Apparently the pore size is too large. A finer (0.05 micro) pore PVC formulation was developed but the fine pore uncoated PVC did not permit water flux at pressures much below 800 psi. (OSW)

Available from the National Technical Information Service as PB-222 978, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No. 868, March 1973. 86 p, 16 fig, 32 tab, 5 ref. 14-30-2784.

Descriptors: *Reverse osmosis, *Membranes, *Permselective membranes, *Semipermeable membranes, *Desalination apparatus, Filtration, Plastics, Thin films, Pressure, Desalination.
Identifiers: *Porous PVC Tubulets, Cellulose acetate coating, Tubulet bundles.

Formulation and methods for preparing porous 0.027 inch OD tubulets at extrusion rates of 200 feet/minute were perfected. Methods for coating long lengths of tubulet with uniform flaw-free asymmetric cellulose diacetate were developed. A bundle permeator was assembled and potted. The permeator characteristics with 515 psi, 0.5% NaCl are Flux - 15.9 gal/day, 10 gft2d, Salt Rejection - 95.8%, Flux/volume - 10,970 gal/day/cu. ft. Work with coating systems other than asymmetric cellulose diacetate was carried out but these alternate systems were not developed as far as would be needed to prepare a bundle permeator. (OSW)

RESEARCH ON ADVANCED MEMBRANES FOR REVERSE OSMOSIS,
Envirogenics Co., El Monte, Calif.
A. F. Graefe, W. J. Schell, C. W. Saltonstall, Jr., V. T. Stannett, and H. B. Hopfenberg.
Available from the National Technical Information Service as PB-223 008, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No. 870, March 1973. 55 p, 15 fig, 14 tab, 16 ref. 14-30-2999.

Descriptors: *Reverse osmosis, *Membranes, *Semipermeable membranes, Sea water, Permselective membranes, Semipermeable membranes, Permeability, *Desalination.
Identifiers: Polysulfone, Sulfonated polysulfones, Composite membranes, Asymmetric membranes, Polyoxetanes.

One of the objectives was that of preparing new noncellulosic polymers for asymmetric membrane fabrication that exhibit intrinsic chemical and reverse-osmosis transport properties superior to those of cellulose acetate. Those polymers containing ether and sulfone groups appeared to be the most promising; accordingly, attention was directed to the evaluation of modified polysulfones and polyoxetanes. With respect to asymmetric membranes it was found that sulfonation of Bakelite polysulfone (Union Carbide, P1700) yielded a product possessing intrinsic osmotic properties superior to those of cellulose acetate. Dense films of sulfonated polysulfone exhibited rejections of 35,000 ppm sodium chloride as high as 99.6% at 1500 psig. The development of asymmetric membranes from sulfonated polysulfone resulted in sodium chloride rejections greater than 91% with a flux of 27.5 gfd at 400 psig. Fluxes as high as 66 gfd were achieved with sodium sulfate at 400 psig with a rejection of 95.6%. Studies of composite membranes found that poly (2-methyl-5-vinyl) pyridine deposited on tubular polysulfone support membranes exhibited greater than 30 gfd flux and and 40% rejection with 1000 ppm magnesium sulfate at 400 psig. An investigation was made relating to the modification of Penton, in film form, through the radiation grafting of selected hydrophilic monomers. Successful grafting was achieved with styrene, methyl methacrylate, and 2-vinyl pyridine. (OSW)

Descriptors: *Desalination, Desalination processes, *Reverse osmosis, *Membrane processes, *Pilot plants, Brackish water.
Identifiers: Helical tubular module elements, Field evaluation testing.

A brackish water desalting reverse osmosis pilot plant incorporating 36 series-connected helical tubular segments, each formed from a one inch diameter, 50 foot long tubular membrane was designed and fabricated. The membrane permselectivity was varied from the system inlet to outlet in a predetermined manner in order to enhance overall system performance. Individual membrane segments were subjected to laboratory tests with 5000 ppm NaCl and 2000 ppm Na2SO4 test solutions to establish (a) effects of inlet pressure, temperature and velocity on performance; (b) membrane compaction rates, burst pressures, and frictional pressure drop; and (c) effects of negative pressures and pressure cycling. The assembled pilot plant was tested in the laboratory to verify design integrity and performance at various operating pressures, fractional recoveries and feedwater velocities. Subsequently, the pilot plant was installed and operated at the OSW Brackish Water Test Facility at Roswell, New Mexico. A sixty day qualification test period was successfully completed on July 6, 1972. (OSW)

3C. Use of Water of Impaired Quality

SALINITY STUDIES IN EAST GLADES AGRICULTURAL AREA, SOUTHEASTERN DADA COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
J. E. Hull, and F. W. Meyer.
Open-file Report 73005, 1973. 84 p, 20 fig, 2 tab, 18 ref.

Descriptors: *Salinity, *Surface waters, *Groundwater, *Florida, Agriculture, Hydrologic data, Land use, Groundwater movement, Water levels, Saline water intrustion, Topography, Streams, Canals, Soils, Saline soils, Water analysis, Chemical analysis, Aquifer characteristics, Chlorides, Data collections, Forecasting.
Identifiers: *Dade County (Fla.).

Investigations were made in southeastern Dada County, Florida, to determine the source of salts in the soil and the process by which the salts accumulate. Saline soils in the East Glades agricultural area are caused chiefly by brackish groundwater moving upward from the water table during dry periods. Brackish groundwater is caused by infiltration of saltwater from nearby coast-normal canals and by inland movement of saltwater through the deep parts of the Biscayne aquifer during droughts. The soils most prone to salt accumulation generally occur within the area affected by sea-water intrusion. The outlook for the East Glades is for no improvement in saline soil problems unless land use changes permit higher water levels along the coast to halt the inland movement of seawater. (Woodard-USGS)

CROP YIELDS FROM LAND RECEIVING LARGE MANURE APPLICATIONS,
Texas A and M Univ., College Station.
D. L. Reddell, P. J. Lyerly, and J. J. Hefner.
Paper No 72-960 presented at 1972 Winter Meeting, American Society of Agricultural Engineers, Chicago, Illinois, December 11-15, 1972. 14 p, 2 fig, 7 tab, 9 ref.

Descriptors: Application methods, *Cultivation, *Crop yield, Nitrates, Forage, Salinity, *Farm wastes, Cattle, *Waste disposal, Texas, Ground water, Irrigation, Aquifer, *Fertilizers, Moisture content, Nutrients.

The objectives were to evaluate the pollution and crop growth due to deep plowing large amounts of beef manure. Two problems faced by feed lot operators have been finding sufficient land on which to use large quantities of feed lot waste and contending with the excessive salinity of such waste. Three locations with Hoban silty clay loam, and Vinton fine sandy loam were used and graduated amounts of waste up to 900 tons per acre were applied at depths of 14 to 36 inches. Rates of application and nitrate contents of crops yielded are recorded. Results show peak yield and nitrate composition of crops to be on those acres with 25 and 50 tons of farm waste. In all locations acres with 900 tons per acre yielded more than the check plot (0 tons per acre). Those most heavily laden plots presented no major surface water pollution problem. COMPREHENSIVE PLAN FOR BATON ROUGE.
Baton Rouge City-Parish Planning Commission, La.

June, 1972. 113 p, 5 fig, photos, 20 maps, 21 tab.

Descriptors: *Comprehensive planning, *Land use, *Flood plains, *Louisiana, Urbanization, Drainage, Environmental effects, Flood plain zoning, Canals, Sewerage, Projections, Implementation, *Cities.
Identifiers: *Land use plan, Flood plain management, *Baton Rouge, Utility extension policies.

The purpose is to help guide urban development in East Baton Rouge Parish where the present population of 300,000 is expected to reach 425,000 during the planning period of 15 to 20 years. The emphasis is on relating urban land uses to various determinants such as the natural environment, economic growth, social considerations, and population growth and then proposing a general land use plan as a guide for future development. Some key elements of the plan, particularly in terms of implementation are the expansion of transportation, recreation, and sewerage systems in accordance with planned priorities, the delineation and restricted use of flood plain and conservation areas, and the reformulation of zoning policies and principles. Surface water drainage is a crucial element in land use planning in Baton Rouge Parish as the annual rainfall is about 60 inches. Drainage canals are widely used to drain

residential areas and relieve flooding conditions. However, it is also necessary to deter future urban development from flood plain areas. Efforts are now being directed toward adopting a flood plain zoning regulation and other management measures. (Elfers-North Carolina)

NATURAL ENVIRONMENTAL ANALYSIS, NASHVILLE-DAVIDSON COUNTY, TENNESSEE.
Metropolitan Government of Nashville-Davidson County, Tenn. Planning Commission.

August, 1973. 125 p, 15 fig, photos, 11 maps, 9 tab, 61 ref.

Descriptors: *Environmental effects, *Urbanization, Slopes, Watersheds (Basins), Soils, Geology, *Tennessee, Cities.
Identifiers: *Environmental analysis, Highland Rim Escarpment, Cumberland River, J. Percy Priest Reservoir, *Nashville (Tenn.).

Components of natural environment are identified and analyzed with regard to limitations for development, and the relationship between conservation and urban development for Davidson County is explored. In discussion of the county's hydrology micro-watershed areas of the Cumberland River are identified and classified by general physical characteristics. Cheatam Reservoir (Cumberland River) and Old Hickory Dam effect flood control conservation and recreational opportunities. Old Hickory Dam also provides hydroelectric power for the general area. Construction of J. Percy Priest Reservoir in 1970 containing approximately 14,200 water acres on Stones River lowered the average elevation in the county susceptible to flooding from 420 ft. to 412 ft. above sea level. Extensive land areas around the reservoir insure high degree of water quality and environmental control. Large recreation areas are under construction. Development in flood plains is increasing. Devices to control flooding are considered. Emphasis should be placed on a balance between structural and regulatory controls. Regulations should prohibit certain uses in parts of flood plain most susceptible to flood losses. The value of the Cumberland River to provide a natural corridor through the urban area and the development of the Harpeth River and Mill Creek watersheds as urbanization increases and flood problems multiply is discussed. Ground water from 8% of county wells yield enough water for commercial, light industrial and home use. A need for new land development regulations and strategy for public and private action are expressed. (Stein-North Carolina)

CENTRAL FRESNO COUNTY WATER AND LIQUID WASTE PROGRAM: VOLUME I--FINDINGS, CONCLUSIONS, RECOMMENDATIONS.
Grunwald, Crawford and Associates, Inc., Fresno, Calif; and Engineering-Science, Inc., Fresno, Calif.

Prepared for Board of Supervisors, Fresno County, California. March, 1970. 127 p, 22 fig, 33 tab. append. HUD Calif. P-308.

Descriptors: *Planning, *Water supply, *Sewerage, *Groundwater, Urbanization, Water demands, Computer models, Coordination, Management, *California.
Identifiers: *Fresno County (Calif), San-Joaquin Valley Region.

This report is the first part of a five volume, comprehensive study of planning for water supply and wastewater disposal in a 410 square mile area of Fresno County, which includes Fresno, Clovis, Fowler, Kingsburg, and Selma plus adjacent agricultural lands. Basically a summary of the entire study, this volume includes short presentations on urban development patterns, projected demands for 3 periods: short-range (1975), mid-range (1985), and long-range (2015), FUTURE PROBLEMS, RECOMMENDED DEVELOPMENT PROGRAMS, FINANCING, AND INTERGOVERNMENTAL APPROACHES. Population is expected to triple by 1015. Food products manufacturing will continue to be the largest manufacturing industry in the County. Significant future shifts in the top five employment categories are projected with agricultural workers being replaced by those in the professional services, while retail trade and manufacturing remain relatively stable. Of particular interest is the Fresno Groundwater Basin, a 1,200 square mile hydrologic unit including Fresno County, and the development of a computer model to evaluate effects of future urban land use. Some of the recommendations include the consolidation of twelve local sewerage systems into two regional ones, the comprehensive management of the entire Fresno Groundwater Basin, the use of surface water in addition to the groundwater supplies, and the use of joint agreements rather than a regional agency. Numerous maps and charts supplement the text. (Elfers-North Carolina)

PRELIMINARY REPORT OF PUBLIC UTILITIES ANALYSIS.
Janesville Div. of Public Works, Wis.

April, 1972. 65 p, 14 fig, 11 tab.

Descriptors: *Planning, *Water supply, *Sewerage, *Drainage systems, Wells, *Wisconsin, Projections, Urbanization, Land use, Groundwater.
Identifiers: *Utility system expandion, *Janesville (Wis.), Rock River, Drainage greengelts.

The existing water supply, sanitary sewerage, and storm water disposal systems for Janesville, some of the problems involved in their operation and possible expansion, and population and land use projections requiring system expansion, several courses of action are proposed for improvement of the systems are described. The water supply system uses both deep and shallow wells and emphasis for future growth is on extension of new water lines, development of a few new well sites, and the protection of groundwater recharge northeast of the city. The sanitary sewerage system is presently adequate except for one overloaded trunk line; a relief sewer line is proposed to run parallel to the overloaded one. The overall system is to be expanded in accordance with urban growth control policies. The storm sewer system consists largely of natural greenbelt drainage ways which are required to be dedicated to the city by developers. This greenbelt dedication policy is encouraged to be continued along with the policy of discharging stormwater to the land rather than directly to the Rock River whenever possible. A FUNDAMENTAL COMPARISON OF THE UTILITY OF TRICHLOROETHYLENE AND PERCHLOROETHYLENE IN THE APPLICATION OF DISPERSE DYES TO POLYESTER,
Auburn Univ., Ala. Water Resources Research Inst.
W. S. Perkins, and D. M. Hall.
In: Proceedings, Textile Solvent Technology--Update '73, Atlanta, Georgia, January 10-11, 1973. p 49-57, (1973). 13 fig, 7 tab, 10 ref, (Amer. Assoc. of Chemists and Colonists Symposium). OWRR A-020-ALA (2).

Descriptors: *Textiles, *Solvents, *Dyes, Sorption.
Identifiers: *Polyester, Trichloroethylene, Perchloroethylene, Partition coefficients.

Polyester may be rapidly dyed with selected Disperse dyes from trichloroethylene and perchloroethylene. The rate of sorption of dye by polyester is much greater from both of these solvents than from aqueous medium. Further, the rate of sorption increases greatly with increasing temperature in each solvent. A higher dyeing temperature is required to achieve as rapid rate of sorption of dye from perchloroethylene as from trichloroethylene. The equilibrium sorption of dye decreases with increasing temperature in all cases studied. Partition coefficients of each of the dyes studied are higher from perchloroethylene than from trichloroethylene. The equilibrium sorption of dye by polyester from trichloroethylene and perchloroethylene is dependent on the polarity of the dye molecule with more polar dyes in this study giving higher partition coefficients.

INTENSITY OF PLANT TRANSPIRATION IN CERTAIN VARIETIES AND MUTANT FORMS OF COTTON, (IN RUSSIAN),
Akademiya Nauk Tadzhikskoi SSR, Dushanbe. Institut Pochvovediniya.
B. Akhmedov.
Izv Akad Nauk Tadzh SSR Otd Biol Nauk. 1. p 11-14. 1972. Illus.
Identifiers: *Cotton, Flowering, Mutant plants, *Transpiration, *USSR (Tashkent).

The water regime was studied in cotton cultivars 108-F, C-4727, 2421, and mutant No. 1 from Tashkent, mutants No. 1 and 2 obtained at the Institute of Plant Physiology and Bio-physics of the Academy of Science of the Tadzhik SSR, and a mutant from Azerbaidzhan. Mutant forms of 108-F and 2412 had more intense transpiration than the original forms during the early stages of development. In the later stages of transpiration, differences in transpiration were not observed. In all plants studied, transpiration was highest during the period of massive flowering and fruit formation. In general, transpiration increased from morning until midday, and then decreased.--Copyright 1973, Biological Abstracts, Inc.

CONTRIBUTION TO THE KNOWLEDGE OF MINERAL NITROGEN DYNAMICS IN A GREY FERRUGINOUS SOIL AT NIORO-DU-RIP (SENEGAL), (IN FRENCH),
Centre National de Recherches Agronomiques de Bambey (Senegal).
D. Blondel.
Agron Trop Ser Agron Gen Etud Sci. Vol 26, No 12, p 1354-1361, 1971. Illus. English summary.
Identifiers: Fertilizers, *Minerals, *Nitrogen, *Senegal, Sorghum, *Soils (Grey ferruginous).

The dynamics of mineral N as nitrate and ammonium was studied in the field in a design of bare plots and plots under sorghum with or without nitrogenous fertilizer applications. Samples were taken every 10 cm from the surface down to 1 m deep during the 1969 rainy season (900 mm in 4 mo.). Compared with the soils at Bambey and Sefa (Senegal), the N dynamics show 2 characteristics. No mineralization peak is observed at the beginning of the rainy season and the nitrogenous fertilizer stimulates the mineralization of N in the soil.--Copyright 1973, Biological Abstracts, Inc.

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY10, Proceedings paper No 10074, p 1795-1812, October 1973. 7 fig, 2 tab, 9 ref.

Descriptors: *Agriculture, *Water demand, *Linear programming, *Water allocation (Policy), *Water supply, *Forecasting, *Land use, Zoning, Hydraulics, Optimization, Water costs, Pricing, Irrigation water, Farm management, Estimating, Technology, Equations, Systems analysis, Mathematical models.
Identifiers: Federal-state cooperation, Policy, Western States.

A study is reported which used linear programming models to determine optimal water and land allocation and agricultural water needs in the year 2000 under alternative conditions of population, farm policies, exports, technology, and water prices. Fundamentally, the study represents an attempt to estimate whether there is enough water to allow the nation's future food needs to be met at reasonable actual costs by the year 2000. Since this proved possible, the amount of water needed (potential demand) in agriculture was then estimated under the several alternatives, thus also indicating the amount that could be freed from the farm sector for use elsewhere. The linear programming models used encompass U. S. agriculture in its entirety, and all of the commodities and land and water use so involved. These water demand-allocation models include variables and equations for 223 agricultural producing regions, and water resources for 51 supply regions in the 17 Western States and 27 consumer markets. The amount of water used in agriculture is partly a function of the costs of water for irrigation purposes. Thus, an auxiliary objective of the study was formulation of the models so that the demand for water under different pricing policies would be reflected (normatively). The models and results are described in detail. (Bell-Cornell)

SOME CHARACTERISTICS OF NECTAR PRODUCTION IN THE MOUNTAIN HONEY PLANTS OF NORTHERN FERGANA (IN RUSSIAN),
Yu. S. Lynov.
Byull Mosk O-Va Ispyt Prir Otd Biol, Vol 77, No 2, p 118-124, 1972, English summary.
Identifiers: Air temperature, Altitude, *Honey plants, Moisture, Mountain plants, *Nectar, Precipitation, Seasonal, Soil, *USSR (Fergana).

The nectar productivity of N. Fergana, USSR honey plants depends on air temperature during the mesothermic season and on air temperature, and relative air humidity, soil moisture and atmospheric precipitation during the xerothermic season. The nectar productivity of honey plants increases with altitude during the xerothermic season, but decreases again at the upper limit of their range. During the mesothermic season it is higher on slopes of southern exposition.--Copyright 1973, Biological Abstracts, Inc.

RELATIONS BETWEEN HOST PLANTS AND PHENOLOGY OF THE GALL MIDGES CONTARINIA TRITICI (KIRBY) AND SITODIPLOSIS MOSELLANA (GEH.), (IN GERMAN),
Biologische Bundesanstalt, Kiel (West Germany). Institut fuer Getreide-, Oelfrucht-, and Futterpflanzenkr.
T. Basedow.
Z Angew Entomol. Vol 71, No 4, p 359-367. 1972. Illus. (English summary).
Identifiers: Agropyron-Repens, *Contarinia-Tritici, *Germany, Host plants, *Midges, Moisture, Oviposition, *Phenology, Plant population, Rain, Rye, *Sitodiplosis-Mosellana, Soil, Temperature, *Wheat.

The phenological differences between C. tritici and S. mosellana are shown under exact conditions in the laboratory. The existance of a 2nd generation of C. tritici could not be confirmed by investigations in the field. Temperature, rain, and soil moisture influence the course of the wheat blossom midges flights. The effect of the wheat blossom midges best known host plants, i.e., wheat, rye and couch grass (Agropyrum repens) on the population dynamics of the 2 spp. in Germany is examined. Rye is scarcely attacked by S. mosellana in wheat growing areas with a small portion of rye grown in it. But in some areas of the Weser-Ems territory, where only rye is grown, the phenology of S. mosel-lana was adapted to the early blossoming of rye, as shown by laboratory rearing. Winter wheat and spring wheat usually are attacked in the same degree by S. mosellana. Midges that emerge when wheat has finished blossoming, oviposit on wheat ears appearing very late, and on couch grass. The maximum flight of C. tritici is correlated relatively to the time of appearance of the wheat ears. Early varieties of spring wheat do not safely escape the attack by C. tritici. For this midge, too, the wheat ears appearing very late and couch grass are a reservoir of host plants.--Copyright 1973, Biological Abstracts, Inc.

EFFECTS OF SOME SOIL CONDITIONS ON SUGAR BEET SEEDLING EMERGENCE,
Broom's Barn Experiment Station, Bury St. Edmonds (England).
P. C. Longden.
J Agric Sci. Vol 79, No 3, p 543-545. 1972. Illus.
Identifiers: Moisture, Range, Seedling, Soils, *Sugar beets, *Soil conditioners, *Clay soils.

Seven soil conditioners added to a sandy clay soil at Saxmundham (Suffolk, England) did not benefit sugar beet seedling emergence. In microplots at Broom's Barn free draining peat and sandy loam gave consistently more seedlings than limestone loam of flinty loam. In the laboratory, for each of 3 soil types, emergence was maximal only for a small soil moisture range and decreased rapidly when soils became drier or wetter. This suggests that conditioners which increase water-holding capacity should be tested on sandy loams rather than clay soils and that seed bed preparation on heavier soils should seek to aerate the soil.--Copyright 1973, Biological Abstracts, Inc.

SPRINKLING CATTLE FOR RELIEF FROM HEAT STRESS,
Agricultural Research Service, Davis, Calif. Agricultural Engineering Research Div.
S. R. Morrison, R. L. Givens, and G. P. Lofgreen.
Paper No. 72-423 presented at the 1972 Annual Meeting, American Society of Agricultural Engineers, Hot Springs, Arkansas, June 27-30, 1972. 12 p, 1 fig, 5 tab.

Descriptors: *Cattle, *Sprinkling, Feed lots, Air conditioning, Temperature, Performance, *California.
Identifiers: *Heat stress, Respiratory rate.

Sprinkling cattle under shade during the summer in the Imperial Valley of California for one minute every 30 minutes when the temperature was above 80F resulted in significantly higher feed consumption and rate of gain, compared with cattle under shade and not sprinkled. Efficiency of feed conversion, although favoring the sprinkling operation, was not significantly improved over that of uncooled cattle. Sprinkling was as effective as a refrigerated air conditioned barn at 75F in one trial and more effective during a second trial. Sprinkling and refrigeration promoted greater comfort as indicated by the prevention of increases in respiratory rate and body temperature observed in the afternoon with control cattle. Both noncooled and cooled cattle consumed more feed and gained

more weight with 40 feet per head of space than with 20 feet. (East-Central)

MANURING OF POTATOES ON FEN SILT SOILS IN HOLLAND, LINCOLNSHIRE,
Agricultural Development and Advisory Service, Cambridge (England).
C. Berryman, T. Batey, T. H. Caldwell, and D. A. Boyd.
Journal of Agricultural Science, Vol 80, p 269-281, April, 1973. 1 fig, 12 tab, 17 ref.

Descriptors: Silts, *Fertilizers, *Potatoes, Nitrogen, Phosphorus, Potassium, *England, *Nutrients, Drainage, *Farm wastes, *Waste disposal, Soil profiles.
Identifiers: Tuber blackening.

Eighteen potato manurial experiments were conducted on silt soils in England between 1953 and 1963. The mean response to nitrogen in these soils was much larger than in most English soils, but responses were varied from site to site. The nitrogen was effective in increasing tuber size and yield of ware; phosphorus increased tuber numbers and decreased ware percentage. Because of the heavy potassium content of the soils tested, responses to the potassium were slight. Cooking tests showed little effect of manurial treatment on the amount or degree of tuber blackening. The recommended fertilizer nutrient requirements for light and medium silt soils are N--200 kg/ha, P2O5--130 kg/ha, and K2O--190 kg/ha. The same nutrient recommendations for the heavy silt soils were 200 kg/ha, 310 kg/ha, and 100 kg/ha respectively. (Frantz-East Central)

WATER REQUIREMENTS OF WHEAT (TRITICUM AESTIVUM L.) FROM METEOROLOGICAL PARAMETERS,
Meteorological Service of Canada, Toronto (Ontario).
B. Padmanabhamurty, and S. K. Dasgupta.
Indian J Agric Sci. Vol 42, No 3, p 223-226. 1972. Illus.
Identifiers: Air temperature, Equations, *Evapotranspiration, Meteorological parameters, Relative humidity, Sunshine, Temperature, Transpiration, Triticum-Aestivum, *Wheat, Wind speed, *Water requirements.

Evapotranspiration from wheat crop was estimated from air temperature, wind speed sunshine duration and relative humidity. An equation was developed for the climatic conditions obtained at Poona, India. The equation was derived from 1962-63 data and was tested by applying it to the observed data for 1954-55 and 1957-58 from a wheat crop. Within the limits of accuracy of observation, the estimated values are closely related to observed values.--Copyright 1973, Biological Abstracts, Inc.

THE INFLUENCE OF MANURE AMELIORATION TREATMENTS ON PHYSICAL PROPERTIES OF SANDY SOIL, (IN POLISH),
Instytut Uprawny Nowozenia i Gleboznawstwa, Baborow (Poland).
R. Baranowski, and W. Ploszynska.
Pamiet Pulawski. 45. p 73-84. 1971. Illus. (English summary).
Identifiers: Amelioration, *Manure treatment, Physical properties, Porosity, *Sandy soil, Crop yield, *Soil treatment.

In order to investigate the efficiency of Egersegi's method an experiment on sandy soil was established by varying the plowing depth and the quantity of manure applied to the soil. After 5 yr the treatments were repeated. After 10 yr measurements of physical properties characterizing the compression and air-water-relationships in respective layers of the soil profile were performed. The amelioration increased the field capacity of soil but did not change the permanent wilting point and maximal hygroscopicity of the soil. The increase of water storage was from 10 to 25%. Plots with 2 manure applications showed a better pore distribution as a result of an increase of quantity of medium pores providing plants with water. Deep plowing and addition of organic matter changed the natural structure of the soil profile. The total porosity of the plowing layer decreased but the subsoil layer became looser. Yield increases were related to improved soil physical properties.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: Calcium, Chemical composition, *Cocksfoot, Fertilization, Irrigation, Magnesium, Minerals, *Nitrogen fertilizer, Phosphorus, Potassium, Sodium, Uptake, *Water supply, Crop yield.

N was applied in rates divided between 4 successive cuts. In one subblock plants were provided with water by rainfall only, while in the other rainfall deficiency was supplemented by tap water. A positive influence of irrigation on the yield increase of foddler cocksfoot and fertilized with N, but not with too high doses (720 kg N/ha) was found. The N fertilization decreased water utilization for the production of the dry matter unit. N fertilization caused some changes in chemical composition namely the increase of the content of total N, protein N and non-protein forms of N, especially of nitrate N, usually the increase of Ca, Mg, and Na content and the decrease of P and K content. Irrigation had no great influence on the P, K, Ca and Mg content but it increased Na and in general the decreased N content. Due to N fertilization the uptake of mineral components was greater and irrigation stimulated this uptake. The higher N doses decreased the sum of carbohydrates, while they did not change the content of raw fiber.--Copyright 1973, Biological Abstracts, Inc.

04. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control of Water on the Surface

CHEMICAL AND BIOLOGICAL CHARACTER OF RIO GRANDE WATER IN THE BOSQUE DEL APACHE WILDLIFE REFUGE,
New Mexico Inst. of Mining and Technology, Socorro. Dept. of Chemistry.
D. K. Brandvold, J. A. Brierley, and C. J. Popp.
Available from the National Technical Information Service as PB-224 450, $3.50 in paper copy, $1.45 in microfiche. New Mexico Water Resources Research Institute La Cruces, Technical Completion Report 030, August 1973. 50 p, 4 fig, 12 tab, 21 ref. OWRR A-038-NMEX (2).

Descriptors: *New Mexico, *Wildlife, *Water quality, Eutrophication, *Water analysis, *Waterfowl, Microbiology, Aquatic microbiology, Salinity, Sediments, Biological properties, Chemical analysis, Nitrogen, Mercury (Metal), Biochemical oxygen demand, Water temperature, Dissolved oxygen, Dissolved solids, Silica, Sulfates, Nitrites, Chemical oxygen demand, Bacteria, Aquatic microorganisms, *Rio Grande River, Hydrogen ion concentration.
Identifiers: Specific conductance, Dissolved phosphates, Chloride, Fecal coliform, Uric acid.

The project purpose was to study the effects of a waterfowl refuge on water quality monitoring the physical, chemical, and biological character of the water in the Bosque del Apache Wildlife Refuge along the Rio Grande in Socorro County, New Mexico. A regular monthly monitoring program over the three-year study period was set up to collect and analyze water samples from eight points

within the refuge. The types of water monitored were as follows; water entering the refuge, water leaving the refuge, Rio Grande water within the refuge which served as a control since it was not used in refuge management, swamp water, irrigation water, fishing pond water, and high-water-fowl-use temporary ponds. The water used as a waterfowl habitat was not degraded in quality as a result of the presence of waterfowl. There was no increase in soluble nitrogen compounds or any other nutrient associated with eutrophication problems. There were no apparent bird-related changes in the microbiological parameters of water quality. However, impoundment of water for habitat ponds resulted in an increase of water salinity through concentration of dissolved ions by evaporation. The water used by the refuge had a high concentration of suspended sediments. This appears to effect the concentration of inorganic compounds and microbial populations by adsorption. (Creel-New Mexico)

FLOOD CONTROL MODEL FOR MULTI-RESERVOIR SYSTEMS,
Natal Univ., Durban (South Africa). Dept. of Civil Engineering.
J. S. Windsor.
Presented at: The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 19 p, 4 fig, 5 ref.

Descriptors: *Water resources development, *Flood control, *Reservoirs, *Linear programming, Multiple-purpose projects, Optimization, Reservoir releases, Flood damage, Costs, Storage, Evaluation, Forecasting, Mathematical models, Systems analysis.
Identifiers: *Cost minimization, Operating policy, Time stage, Hydro-meteorological conditions, Flood periods.

A recursive linear programming model for the analysis of a system of flood control reservoirs is presented. The system is operated over a number of discrete time periods and the model is used to determine the operating policy which minimizes the downstream damage costs associated with the magnitude of reservoir releases. By dividing flood periods into shorter operational periods, it is shown how system policies may be adjusted to incorporate the latest forecast information, and thus ensure maximum flexibility under actual operating conditions. The method proposed recognizes component interaction in time and space and affords a means of evaluating the effects of forecasting. This is accomplished with a series of sequentially-related linear programming routines to cover the entire flood period, where the inputs to the model are adjusted at each time stage to reflect the changing storage and hydro-meteorological conditions. It is assumed that decisions regarding the number, location and size of the individual reservoirs have been previously made. (Bell-Cornell)

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY10, Proceedings paper No 10058, p 1813-1822, October 1973. 2 fig, 6 tab, 5 ref.

Descriptors: *Reservoir operation, *Recreation facilities, *Drawdown, *Estimating, *Water level, Water requirements, Optimization, Sequencing, Storage capacity, Systems analysis, Mathematical models, *Canada.
Identifiers: *Trent Canal (Ontario-Canada), Shoreline physiography.

A model for the operation of the reservoir feeder-lakes of the Trent Canal in Ontario, Canada is presented. Using data which describe shoreline physiography and a scale which ranks shoreline recreation usability, coefficients are calculated which estimate the maximum water-level drawdown that a reservoir can tolerate. Matrix conventions are used to associate drawdown tolerances to the relative and the absolute storage capacity of the reservoirs. From the matrix, priority-ordering situations for reservoir operation are identified. The sequence of operation of reservoirs can be compared in various situations of reservoir water-storage depletion, and water requirements. The model allows shoreline physical recreation usability to be included in the rationale for reservoir operation, and it quantifies means whereby the effect of reservoir operation on recreation may be minimized. Identifiers: *Operating policy, *Net benefits, Successive approximation method, Gradient technique, Coarse grid method.

The design of a system of reservoirs includes the determination of the size of the reservoir to be built at each proposed reservoir site. The design is considered optimal when the net benefits, which are a function of the reservoir sizes and the operating policy, are maximized. A method is developed to determine the optimal design of any system of reservoirs with series and parallel connections; the technique is applied to a six reservoir system. For a specific set of reservoir sizes, the return from the system is determined from the optimal operating policy. This policy is determined by decomposing the original multiple state variable dynamic programming problem by Bellman's method of successive approximation into a series of subproblems of one state variable so that the sequence of optimizations over the subproblems converge to the solution of the original problem. The costs are assumed to be a function of reservoir size and are computed from storage capacity versus cost curves. A modified gradient technique is then used to determine the set of reservoir sizes which maximize the net benefits, subject to the imposed constraints. The coarse grid method is used in which the storage increment is varied from 100,000 acre-ft. to 1,000 acre-ft. The algorithm converges to each of the given storage increments. (Bell-Cornell)

LAKE OKEECHOBEE SEEPAGE MONITORING NETWORK,
Geological Survey, Talahassee, Fla.
D. J. McKenzie.
Open-file report 73018, 1973. 64 p, 38 fig.

Descriptors: *Seepage, *Dikes, *Lakes, *Florida, Data collections, Monitoring, Groundwater movement, Aquifer characteristics, Water level fluctuations, Hydrogeology, Seepage control, Underseepage, Water loss, Hydrologic data, Hydrographs, Water wells, Sampling, Water analysis, Chlorides, Correlation analysis, Surface-groundwater relationships.
Identifiers: *Lake Okeechobee (Fla).

In 1962, the Central and Southern Florida Flood Control District requested the Geological Survey to evaluate the seepage beneath the Hoover Dike

along the south shore of Lake Okeechobee. Results of the study were reported by Meyer (1971) (See W72-02954). The study indicated, among other things, a need for a monitoring program which would be helpful in determining the effects that buildup of a filtercake in lakeside borrows and changes in drainage works would have on future seepage rates. This report summarizes the data collected at the five original monitoring sites along the south shore of Lake Okeechobee from January 29, 1970 to June 28, 1972. In order to use the hydrographs in this report to full advantage, they should be studied in conjunction with Meyer's graphs and text (1971). During steady-state conditions, water seeps from the lake through the filtercake and through the aquifers beneath the dike. At those sites where the filtercake is missing, or has about the same permeability as the aquifers, the seepage from the lake is about equivalent to the flow through the aquifers. Present data are insufficient to determine whether or not filtercake buildup has reduced seepage. No appreciable change in drainage occurred during the observed period. (Woodard-USGS)

RUNOFF FORMATION ON MOUNTAIN SLOPES UNDER CARPATHIAN BEECH AND SPRUCE FORESTS,
O. V. Chubatyy.
Soviet Hydrology: Selected Papers, No 3, p 278-286, 1971. 8 tab, 4 ref. Translated from Forestry (Lesovedeniye), No 3, p 72-80, May-June 1971.

Descriptors: Mountain forests, *Slopes, *Canopy, *Interception, *Runoff, Infiltration, Penetration, Rainfall-runoff relationships, Runoff coefficient, Surface-groundwater relationships, Base flow, Surface runoff, Overland flow, Forest watersheds, Clear-cutting, Water year, Seasonal.
Identifiers: *USSR (Carpathian Mountains), *Beech trees, *Spruce trees.

Carpathian beech and spruce forest trees intercept varying amounts of atmospheric moisture. Average annual amount of precipitation intercepted by the canopy of beech and spruce is 78% and 63.6%, respectively. In winter it amounts to 85.3% for beech and 56.6% for spruce and during the growing season it is 70.7% for beech and 68.6% for spruce. Total runoff in spruce forests is approximately 2.5 times greater than that in beech forests. Most runoff occurs in beech forests in winter and spring and in spruce forests in summer. Carpathian beech, and spruce have approximately the same effect on transformation of overland flow into subsurface and groundwater runoff. Differences in physiographic conditions are largely responsible for the increase in total runoff in spruce forests. The ratio of subsurface runoff to overland flow remains the same in both beech and spruce. Clear-cutting considerably reduces the water-regulating effect of the forest trees. (Josefson-USGS)
W74-00338

SPRING RUNOFF FROM SMALL CATCHMENTS WITH DIFFERENT FOREST COVER IN THE MOUNTAINS OF GEORGIA,
L. S. Azmayparashvili, and R. G. Chagelishvili.
Soviet Hydrology: Selected Papers, No 3, p 286-289, 1971. 2 fig, 2 tab, 5 ref. Translated from Forestry (Lesovedeniye), No 3, p 81-83, May-June 1971.

Descriptors: *Mountain forests, *Forest watersheds, *Small watersheds, *Runoff, Spring, Rainfall-runoff relationships, Discharge (Water), Overland flow, Slopes, Rain water, Snowmelt, Weirs, Seasonal.
Identifiers: USSR, *Georgian SSR.

Four catchment basins with varying degrees of forest cover were selected for study in the Boshur forested area of the Georgian Republic. The catchments have an average elevation of 1,400-1,500 m above sea level and a gradient of 25-30 deg. Average annual amount of precipitation is 600 mm. The forest trees on slopes of the catchment basins are mainly beech-hornbeam and oak-pine stands with an admixture of spruce, fir, aspen, and birch. Runoff from catchment basins is directly proportional to precipitation intensity and inversely proportional to density of forest cover. A catchment with a cover density of 70% has no overload flow, and the range of rainfall and snowmelt runoff fluctuations is negligible. A significant increase in spring rainfall runoff and its sudden cessation in small catchments with cover densities of 30% and 50% are due to overland flow of rainwater and snowmelt water, increased evaporation from the basin surface, and unfavorable conditions of groundwater discharge into streams. Catchment basins with cover densities of 30% and 50% do not produce stable runoff. (Josefson-USGS)

APPLICATIONS OF LINEAR INTEGER PROGRAMMING TO PROBLEMS OF LAND USE ALLOCATION,
Michigan Univ., Ann Arbor. School of Natural Resources.
R. L. Patterson.
Available from the National Technical Information Service as COM-73-10408 $3.00 in paper copy, $1.45 in microfiche. SEA Grant Technical Report 31, MICHU-SG-72-213, June 1972. 36 p, 3 fig, 7 tab, 5 ref.

Descriptors: *Land use, *Alternative planning, *Linear programming, Optimization, Algorithms, Decision making, *Constraints, Costs, Equations, Mathematical models, Systems analysis, *Michigan.
Identifiers: *Allocation, Integer programming, Land use requirements, Resource requirements, Regulatory agencies, *Mission Peninsula (Mich).

Constraints in the allocation of land for uses can appear in many forms, such as budget limitations for development, measures of user satisfaction, environmental quality standards, and total amount of land available. No single model is adequate to cover all combinations of possible constraints. Presented are various land use allocation problems and the method used to solve them. The problems are constrained optimization problems--choosing the most preferred pattern of site uses from a limited set of alternatives. Developers determine their own preferences covering a limited set of sites; each opts to gain his maximum advantage so that the set of land use decisions is optimized from the collective points of views of this set of users. A simplified land use assignment problem solved by integer programming and a multiple land use assignment problem utilizing linear programming are described. Difficulties in formulating linear objective functions and in specifying cell size are discussed. Then a modified site assignment problem is presented in which the simplified land use assignment model is more realistically applied redefining sites as 'feasible' for 'specific' land use 'needs'; the algorithm assigns needs to feasible sites so as to minimize total cost. Finally, a special case of 'goals programming' is described and illustrated, using linear programming. (Bell-Cornell)

WATER RESOURCES OF THE NISQUALLY INDIAN RESERVATION, WASHINGTON,
Geological Survey, Tacoma, Wash.
D. A. Myers, and J. E. Cummans.
Open-file report, 1973. 30 p, 5 fig, 12 ref, append.

Descriptors: *Water resources, *Water quality, *Indian reservations, *Washington, *Hydrologic data, Surface waters, Groundwater resources, Water yield, Streamflow, Water wells, Aquifer characteristics, Floods, Water utilization, Water analysis, Chemical analysis, Water level fluctuations, Projections, Water resources development.
Identifiers: *Nisqually Indian Reservation (Wash).

The Nisqually Indian Reservation, Washington, has an abundant supply of good-quality surface water and groundwater for increased housing and small-scale commercial development and for potential development of a fish hatchery or other aquaculture facilities. The average annual discharge of the Nisqually River is about 2,200 cfs Floods of the Nisqually River are reduced somewhat at La Grande and Alder Dams upstream. At the reservation, the river overflows its channel at discharges of about 21,000 cfs, which has one chance in six of happening in any one year. A floodflow of about 35,800 cfs would cover the flood plain to a depth of about 2 feet. Such a flood has one chance in 100 of happening in any one year. Yields from wells range from 5 to 25 gpm but appreciably greater yields are possible. (Woodard-USGS)

MODIFICATION OF WATER QUALITY DURING ARTIFICIAL GROUNDWATER RECHARGE,
A. M. Perlina, and V. M. Berdanov.
Soviet Hydrology: Selected Papers, No 4, p 391-396, 1971. 4 fig, 1 tab, 9 ref. Translated from Water Supply and Sanitary Engineering (Vodosnabzhenive i Sanitarnaya Tekhnika), No 7, p 1-4, 1971.

Descriptors: *Groundwater recharge, *Artificial recharge, *Water quality control, *Water treatment, *Water purification, Filtration, Filters, Water properties, Water supply, Curves.
Identifiers: *USSR.

Artificial recharge of groundwater by surface water from rivers, lakes, and reservoirs is being widely practiced in a number of countries to help meet domestic water demands. In the USSR artificially recharged groundwater is being used in water-supply systems of Riga, Kaunas, Novokuznetsk, Ivano-Frankovsk and other cities. The quality of water supplied to filtration plants should meet certain requirements. The suspended-particle concentration should not exceed 10-20 mg/liter, depending on particle size of the soil filter. Chromaticity, depending on its components, should not exceed 60 deg. The dissolved oxygen content of water, which governs permissible permanganate oxidation, should be within limits of 15 mg/liter. (Josefson-USGS)

ROLE OF DIGITAL COMPUTER MODELS OF AQUIFERS IN WATER RESOURCES PLANNING: CASE STUDY IN TUCSON, ARIZONA,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
C. C. Kisiel, D. Supkow, and W. Tetley.
Presented at: The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 22 p, 2 fig, 7 ref.

Descriptors: Water resources, *Planning, *Aquifers, *Computer models, Digital computers, *Groundwater, Management, *Arizona, Stochastic processes, Hydraulic models, Models studies, Evaluation, Forecasting, Water supply, Systems analysis, Economics, Risks.
Identifiers: *Tuscon (Ariz), *Error analysis, Data worth, Thermal models, Chemical models.

Aquifers have been operated with increasing frequency in conjunction with surface water systems. In some instances, as in Tucson, the aquifer serves as the only or primary source of water supply. The role of digital computer models of aquifers in planning and design and in guiding future data collection activities to reduce uncertainties in aquifer management is reviewed. An outline is presented of the elements of hydraulic, chemical and thermal modles of the Tucson aquifer. The hydraulic model is a constraint on efficient allocation of water within the basin either from a supply or a demand-oriented approach. The chemical models forecast total dissolved solids and nitrate movement from reclaimed wastewaters. The chemical and heat models are valuable in guiding pumping and recharge decisions. All the models can be used for analyses of the cost of forecast errors and for finding the economic worth of more data on pumpage, transmissivity, storage properties, recharge and water levels in reducing uncertainty. Experience indicates that while digital computer models of aquifers are not themselves sufficient to water resources planning, they are at least one necessary element in a more rational approach to such planning. Once such models are constructed they are easily updated and maintained as part of the planning process. (Bell-Cornell)

ARTIFICIAL-RECHARGE EXPERIMENTS AND OPERATIONS ON THE SOUTHERN HIGH PLAINS OF TEXAS AND NEW MEXICO,
Geological Survey, Austin, Tex.
R. F. Brown, and D. C. Signor.
Available from NTIS, Springfield, Va. 22151 as PB-222 921; Price $3.00 printed copy; $1.45 microfiche. Water-Resources Investigations 10-73, May 1973. 54 p, 19 fig, 6 tab, 50 ref.

Descriptors: *Artificial recharge, *Groundwater recharge, *Injection wells, *Texas, *New Mexico, Playas, Aquifers, Turbidity, Water quality, Water utilization, Irrigation practices, Municipal water, Industrial water, Aquifer characteristics, Evaluation.
Identifiers: *Southern High Plains (Tex and N Mex).

The Southern High Plains of Texas and New Mexico is an area where groundwater is being mined for irrigation, municipal supply, and industrial use. Artificial-recharge experiments and operations have been undertaken to develop methods to supplement the declining groundwater supplies in the Ogallala Formation, a sand and gravel aquifer of Tertiary age. Experiments using highly turbid water from playa lakes for injection into the Ogallala Formation have resulted in greatly decreased yield and limited life for the recharge wells. Recharge of groundwater and surface water of good quality have indicated, however, that injection through wells is an effective method of recharging the aquifer. Water that is slightly turbid can be injected into wells successfully for a period of time, but in most experiments, the use of turbid water resulted in constantly declining yields of the wells and constantly declining capacities for recharge. Redevelopment of wells through pumping and surging will move some of the sediment under certain conditions and significantly prolong the life of the recharge wells. Surface spreading is little practiced, but locally may be/a feasible means of artificial recharge. (Woodard-USGS)

Available from NTIS, Springfield, Va. 22151 as PB-222 558 Price $3.00 printed copy; $1.45 microfiche. Water-Resources Investigations 17-73, June 1973. 42 p, 13 fig, 1 tab, 13 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water quality, *Ohio, Water wells, Well data, Lithologic logs, Aquifers, Water yield, Drawdown, Specific capacity, Water supply, Chemical analysis.

The largest potential water supplies from the 150- to 450-foot thick carbonate-rock aquifer in southwest Ohio are available in a 2,800 square-mile area on the crest and east flank of the Cincinnati arch. The specific capacity of 26 test wells in this high-yield area ranged from 5.4 to 106 gallons per minute per foot of drawdown and averaged 30 gpm per foot. The specific capacity of 23 test wells in the same rocks outside the high-yield area ranged from 0.5 to 5.0 gpm per foot. Wells in the high-yield area produce mainly from the Newburg zone, a permeable stratum in the lower part of the Bass Islands Group, as used by the Ohio Division of Geological Survey. A structure contour map on the top of the Lockport Dolomite shows that the Newburg zone conforms to the configuration of the Cincinnati arch. The chemical quality of the water in the consolidated-rock aquifers is intimately related to the regional flow system and undergoes a progressive change from a calcium bicarbonate type in recharge areas to a calcium sulfate type in areas of natural discharge. (Woodard-USGS)

Descriptors: *Groundwater, *Water balance, *Salt balance, *Grasslands, Water table, Base flow, Groundwater recharge, Water storage, Inflow, Precipitation (Atmospheric), Discharge (Water), Evaporation, Runoff, Infiltration, Irrigation water, Canals.
Identifiers: *USSR (Golodnaya Steppe).

The amount of water delivered to the water table in the Golodnaya Steppe in 1969 was 3,523.9 million cu m, of which 3,072.82 million cu m or 87.2% was groundwater discharge. The amount of water added to groundwater storage was 451.08 million cu m. In 1969 the Golodnaya Steppe received 6,493,000 metric tons of salt, of which 5,966,000 metric tons were removed. The total salt accumulation was 526,560 metric tons. The main sources of salt were irrigation water (4,445,400 metric tons) and atmospheric precipitation (1,600,450 metric tons). In 1969, as compared with 1960, groundwater recharge by rainfall penetration increased sharply (by 1,006.17 million cu m) as did losses from canals (by 356.29 million cu m). Infiltration from irrigated land decreased by 364.21 million cu m. Discharge of groundwater by evaporation and runoff increased by 547.74 million cu m and 458.74 million cu m, respectively. GEOLOGY AND GROUND-WATER RESOURCES OF RUSH COUNTY, CENTRAL KANSAS,
Geological Survey, Lawrence, Kans.
J. M. McNellis.
Kansas Geological Survey Bulletin 207, July 1973. 45 p, 18 fig, 2 plate, 13 tab, 72 ref.

Descriptors: *Groundwater resources, *Geology, *Water wells, *Hydrologic data, *Kansas, Aquifer characteristics, Water yield, Water supply, Water utilization, Water quality, Groundwater movement, Groundwater recharge, Hydrogeology, Chemical analysis, Water levels.
Identifiers: *Rush County (Kans.).

Rush County, which comprises an area of 724 sq. mi in central Kansas, is principally in the Smoky Hills section of the Great Plains physiographic province. The north third of the county is in the Smoky Hill River drainage basin and the rest is in the Arkansas River drainage basin. The average annual precipitation at Bison is 22.21 inches. The principal aquifers are the Dakota Formation, which underlies the entire county, and the Pleistocene deposits in the stream valleys. Yields from wells in the Dakota generally are adequate for stock and domestic purposes, but the chemical quality of the water may be considered marginal for most uses. The Pleistocene aquifer in Walnut Creek valley yields 290 to 1,200 gpm to wells for irrigation. Yields as great as 1,500 gpm have been reported. Pleistocene deposits in other stream valleys yield adequate supplies for stock and domestic purposes. Water from Pleistocene deposits commonly is hard to very hard, but is satisfactory for most uses. Recharge to the aquifers is principally from local precipitation. The aquifer in Walnut Creek valley receives sizable amounts of recharge during periods of high flow in Walnut Creek. (Woodard-USGS)

GROUND-WATER CONDITIONS IN UTAH, SPRING OF 1973,
Geological Survey, Salt Lake City, Utah.
E. L. Bolke.
Utah Division of Water Resources Cooperative Investigations Report No 12, 1973. 101 p, 56 fig, 3 tab, 12 ref.

Descriptors: *Groundwater resources, *Water wells, *Water utilization, *Hydrologic data, *Utah, Basic data collections, Aquifer characteristics, Water yield, Pumping, Water level fluctuations, Groundwater recharge, Precipitation (Atmospheric), Water, quality, Correlation analysis, Hydrographs, Maps, Geology, Hydrogeology.

Individual discussions are presented of the most important areas of groundwater withdrawal in Utah for the calendar year 1972 and for the 10-year period 1963-72. Water-level fluctuations are described for the periods spring 1972 to spring 1973 and spring 1963 to spring 1973. The estimated total withdrawal of water from wells in Utah in 1972 was about 800,000 acre-feet, which is about 90,000 acre-feet more than for 1971 and about 200,000 more than for 1963. The increases for both the 1- and 10-year periods were due chiefly to increased withdrawal for irrigation. During 1972, precipitation was above normal in 4 of the State's 7 climatic divisions. However, precipitation was below normal for 5 of the first 6 months of 1972 for all Utah except the northern mountains. Groundwater levels were generally lower in the southwestern and central parts of Utah from February-March 1972 to February-March 1973 due to increased withdrawal for irrigation. Groundwater levels in northern Utah were variable, and no consistent pattern of water-level changes was evident. Supplementary data such as graphs showing chemical quality of water and maps showing water-table configuration are included. (Woodard-USGS)

STEADY STATE GROUND MOTIONS CAUSED BY SINGLE-WELL PUMPING,
Washington Univ., Seattle. Dept. of Civil Engineering.
C. B. Brown, and S. J. Burges.
Water Resources Research, Vol 9, No 5, p 1420-1427, October 1973. 5 fig, 1 tab, 10 ref.

Descriptors: *Subsidence, *Withdrawal, *Groundwater, *Elastic theory, Land subsidence, Groundwater movement, Drawdown, Water wells, Water yield, Equations.

Surface motions caused by well pumping often cause technical as well as legal problems. A small-deformation theory of such motions is formally developed for a single-well axially symmetric case. The theory involves no coupling between the fluid and solid phase; linear elasticity is used. Numerical comparison with field results suggests that this theory may be adequate to describe steady-state long-term ground motions. (Knapp-USGS)

GROUND WATER RECHARGE, SOUTHERN REGIONAL DISTRICT, MONTGOMERY COUNTY, OHIO, ENGINEERING STUDY AND REPORT, PHASE I.
Moulenbelt and Seifert, Dayton, Ohio.

Project 7204 (1973). 110 p, 46 fig, 10 tab, 26 ref.

Descriptors: *Aquifers, *Well data, *Groundwater recharge, Groundwater, Geology, Water supply, Pit recharge, Recharge wells, Water table, *Ohio.
Identifiers: Great Miami River, Montgomery County (Ohio).

The study looks at the feasibility of recharging the underground aquifer which supplies the Southern Regional District Well Fields in Montgomery County, Ohio. These wells are located in a wide valley of the Great Miami River which contains glacial deposits of stones, gravel, sand, and clay from 150 to 250 feet thick. The quantity of water pumped from this aquifer has steadily increased to about 45 MGD in 1972. Since 1964, when the withdrawal was 33 MGD, the groundwater levels have dropped considerably. Thus, this study focuses on a detailed inventory of past pumping rates and groundwater levels and on exploring and evaluating possible recharge methods and systems. Natural recharge in the area is poor because of a silt layer on the ground surface. However, it is recommended that two gravel pits along the bank of the Great Miami River be used for recharge. These pits can be supplied with water from the river or receive and store storm water from local outfalls. It is recommended that 12 MGD be used for recharge to return groundwater levels to those of 1964. No new production wells should be developed except to replace existing wells until recharge program has been established. A capital investment of $650,000 will be required for the recharge project. Operating expenses and ownership are estimated at $80,000 a year. (Elfers-North Carolina)

NUTRIENT LOSSES AFTER CLEAR-CUT LOGGING AND SLASH BURNING IN THE OREGON COAST RANGE,
Oregon State Univ., Corvallis. School of Forestry.
G. W. Brown, A. R. Gahler, and R. B. Marston.
Water Resources Research, Vol 9, No 5, p 1450-1453, October 1973. 1 fig, 1 tab, 4 ref.

Descriptors: *Nutrient removal, *Clear-cutting, *Runoff, Nitrates, Potassium, Phosphates, Nutrients, Sediment yield, Overland flow, Organic matter, *Oregon, *Small watersheds.

Nutrient release from three small watersheds in Oregon's Coast Range was monitored for 2 years before and 2 years after logging. One watershed, Flynn Creek (203.14 ha), served as an untreated control. Deer Creek (303.32 ha) was patch-cut. No change in the concentration or yield of nitrate nitrogen, phosphorus, or potassium was observed after logging. Needle Branch (70.68 ha) was clear-cut and burned. Maximum nitrate nitrogen concentrations increased from 0.70 to 2.10 mg/liter. Nitrate nitrogen concentrations returned to pre-logging levels by the sixth year after logging. Yield of nitrate nitrogen increased from 4.94 to 15.66 kg/ha the first year after treatment. Potassium concentrations increased markedly after burning from about 0.60 to 4.40 mg/liter but returned to prelogging levels within 2 months. Phosphorus concentrations were unchanged. These changes pose no threat to aquatic or terrestrial productivity. (Knapp-USGS)

MAN'S EFFECT ON THE GREAT LAKES,
A. M. Beeton.
In: Environmental Quality and Water Development, W. H. Freeman and Co., San Francisco. 1973. C. R. Goldman, editor p 250-280, 13 fig, 2 tab, 33 ref.

Descriptors: *Water quality, *Environmental effects, Coordination, *Great Lakes, *Eutrophication, Pollutants, Land use.
Identifiers: Intergovernmental cooperation.

Recommendations for problems generated by the impact of human, and especially urban development on the Great Lakes include: (1) establish an organization representing diverse interests and institutions to serve as a clearing house for developing a priority list of problems and for assigning projects for solution; (2) coordinate efforts of all governmental agencies; (3) disseminate information to all those concerned with Great Lakes use, conservation and management; (4) enforce all applicable water laws; (5) improve legislative basis for management; (6) establish environmental monitoring systems; (7) determine costs and benefits of improving water quality through pollution control; (8) develop water quality models for subregions; (9) examine feasibility of constructing large interception sewer systems along U.S. shores of Lakes Erie and Michigan to carry treated water into neighboring watersheds; (10) study use of dredged spoil for developing recreational lands; (11) consider development of deep water harbors; (12) emphasize the regional relationship between land use and water problems. Also discussed is accelerated eutrophication, noting a significant difference in the rate of deterioration between inshore and open lake waters. It is unrealistic to assume that the entire volume of a lake is available for dispersion and dilution of domestic, industrial and human wastes. The role of human activities in producing these changes is emphasized. (Edwards-North Carolina)

C. J. Posey.
Research Project Technical Completion Report, 1973. 2 p. OWRR A-035-CONN (1). OWRR 14-31-0001-3807.

Descriptors: *Erosion control, *Sediments, *Watershed management, Rock fill.
Identifiers: *Rock sausages.

Previous tests showed that the use of properly graded inverted filter layers could completely stop erosion of cohesionless soils, no matter how fine grained, and that the top layer of the filter was more resistant to being moved by strong currents if bound in mesh tubes. To find how much more resistant, three types of comparisons were made. For the first, after preliminary tests verified that the conclusion reached for cohesionless materials also applied to clay, the resistance of loose rocks and rock sausages (rock fragments encased in a tubular meshing) was compared under attack of a jet plunging through a pool. The second was based on the thrust of a high-velocity stream flowing over a level surface. The last compared fall velocities in quiet water. It was concluded that sausage diameter could safely be half that of solid rocks, but that even more could be gained by utilizing developed tension in the mesh tubes, which could be anchored.

THE RATE OF LOSS OF MERCURY FROM AQUEOUS SOLUTION WHEN STORED IN VARIOUS CONTAINERS,
Idaho Univ., Moscow. Dept. of Chemistry.
R. M. Rosain, and C. M. Wai.
Analytica Chimica Acta, Vol 65, No 2, p 279-284, July 1973. 3 fig, 1 tab, 9 ref.

Descriptors: *Mercury, *Adsorption, *Water storage, *Aqueous solutions, *Plastics, Heavy metals, Hydrogen ion concentration, Acidity, Ions, Chemical analysis, Water analysis, Time, *Pollutant identification, Methodology.
Identifiers: Polyvinyl chloride, Chemical loss, Glass, Natural waters, Distilled water, Flameless atomic absorption spectrophotometry, Detection limits, Sample preparation.

Solutions of natural water and distilled water were spiked with mercury (II) (25 p.p.b.) and stored in polyethylene, polyvinyl chloride, and soft glass containers. Losses of mercury at different pH values were monitored by flameless atomic absorption for a total of 17 days. Severe losses of mercury were observed at pH 2 and 7. Mercury loss from solution followed first-order kinetics; the half-lives of mercury loss under various conditions were calculated. Acidification of the solutions to pH 0.5 with nitric acid curtailed mercury loss substantially. Possible ways of reducing the loss of mercury from environmental water samples are discussed. A NEW SET OF ACIDITY CONSTANTS FOR CARBONIC ACID AND BORIC ACID IN SEA WATER,
Goteborg Univ. (Sweden). Dept. of Analytical Chemistry.
I. Hansson.
Deep-Sea Research and Oceanographic Abstracts, Vol 20, No 5, p 461-478, May 1973. 3 fig, 9 tab, 34 ref.

Descriptors: *Sea water, *Chemical analysis, *Acidity, *Volumetric analysis, Carbonates, Methodology, Hydrogen ion concentration, Salinity, Water temperature, Chemical properties, Ions, Water analysis.
Identifiers: *Carbonic acid, *Boric acid, Potentiometric titration, Dissociation constants, Acidity constants, Inorganic acids.

The dissociation constants of carbonic acid, the acidity constant of boric acid, and the ionic product of water have been determined by potentiometric titrations in synthetic seawater. The interpolated values for the salinity range of 2-4 percent and the temperature range of 5-30C are given for carbonic acid, boric acid, and for pK10. The activity scale is chosen so that the activity coefficient approaches unity when the concentrations of H plus, OH minus, H2CO3 plus CO2, HCO3 minus, CO3 2 minus, B (OH)3 and B (OH)4 minus approach zero in synthetic seawater of a certain salinity. The concentration unit is M sub w, moles per kg solution. Experimental methods and activity scales used by Buch, Harvey, Wattenberg and Gripenberg (1932), Buch (1938) and Lyman (1957) are reviewed. Comparisons of the concentrations of the carbonate species in a sample, obtained by use of tables given by Buch, Lyman and this work, are tabulated. (Holoman-Battelle)

SAMPLING THE EDIBLE MUSCLE OF THE SWORDFISH (XIPHIAS GLADIUS) FOR TOTAL MERCURY ANALYSIS,
Fisheries Research Board of Canada, Halifax (Nova Scotia). Halifax Lab.
H. C. Freeman, and D. A. Horne.
Journal of the Fisheries Research Board of Canada, Vol 30, No 8, p 1251-1252, August 1973. 1 fig, 1 tab, 2 ref.

Descriptors: *Sampling, *Mercury, Marine fish, *Heavy metals.
Identifiers: *Swordfish, *Muscle, Atomic absorption spectrophotometry, Biological samples, Xiphias gladius.

Samples from the longitudinal, depth, and transverse muscle sections of three swordfish were analyzed for total mercury by atomic absorption spectrophotometry. The objective was to determine whether a sample from any area would be representative of all muscle tissue. The total mercury was uniformly distributed in the edible muscle tissue of the swordfish demonstrating that a small sample from any region is representative of the whole muscle tissue. SEPARATION OF WATER FROM BIOLOGICAL AND ENVIRONMENTAL SAMPLES FOR TRITIUM ANALYSIS,
National Environmental Research Center, Las Vegas, Nev.
A. A. Moghissi, E. W. Bretthauer, and E. H. Compton.
Analytical Chemistry, Vol 45, No 8, p 1565-1566, July 1973. 1 fig, 2 tab, 3 ref.

Descriptors: *Tritium, *Separation techniques, Urine, Water, Aqueous solutions, Soil analysis, Water analysis, *Radioactivity techniques, Distillation, Hay, Milk, Chemical analysis, Plant tissues.
Identifiers: Azeotropic distillation, *Scintillation counting, Sample preparation, Tissue, Green chop, Reproducibility, Accuracy, Biological samples, Environmental samples, Animal tissues.

Azeotropic distillation of water using benzene has been tested as a means of separating water from biological and environmental samples for tritium analysis. Samples of soil, animal tissue, green chop, hay, milk, and urine were prepared using the technique, and the results of analyses compared with known or replicate values to determine accuracy and reproducibility. The results were comparable to those for samples prepared by distillation under various pressures and temperatures. However, azeotropic distillation has the advantages of short distillation time at normal pressure, does not require constant observation, and easy removal of the remaining sample for further processing. A SIMPLIFIED CLEAN-UP TECHNIQUE FOR ORGANOCHLORINE RESIDUES AT THE MICROLITER LEVEL,
Lund Univ. (Sweden). Dept. of Animal Ecology.
A. Sodergren.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 2, p 116-119, August 1973. 1 fig, 5 ref.

Descriptors: *Gas chromatography, *Chlorinated hydrocarbon pesticides, *Lipids, Algae, Birds, Fish, Separation techniques, DDD, DDT, Gravimetric analysis, *Pesticide residues.
Identifiers: Clean up, Sample preparation, Biological samples, p p' DDT, p p' DDD, *Organochlorine residues.

A clean-up procedure was developed, primarily for analysis of freshwater algae, in which trace amounts of chlorinated hydrocarbon pesticides and fat content can be determined by electron capture gas chromatography. Only 350 microliters of extract is required. Approximately 50 microliters of extract and an equal amount of fuming sulfuric acid are drawn into a glass tube which is then sealed by flame. The contents are mixed, centrifuged to separate phase, the tube is cut, and the acid discarded. The tube containing the hexane phase is then resealed until analysis. For confirmatory analysis, a part of the remaining original extract is cleaned up by treatment with potassium hydroxide. This is accomplished by heating a special pipette which is sealed at one end and drawing the KOH and extract into the tube as it cools. This is sealed, heated, reopened, water added, resealed, the contents mixed, and centrifuged. The hexane layer is removed and the remaining extract is analyzed for lipids by gravimetric analysis. Fatty and non-fatty samples have been cleaned-up by these procedures with residue recoveries of 78-94 percent. Treatment with KOH converts p,p'-DDT and p,p'-DDD to p,p'-DDE and p,p'-DDMU confirming the identity of the original products. The method was used to determine lipid fractions in muscle tissues of fish and birds. (Little-Battelle)

DETECTION OF TRACE AMOUNTS OF OIL IN SEA WATER BY FLUORESCENCE SPECTROSCOPY,
Bedford Inst., Dartmouth (Nova Scotia).
P. D. Keizer, and D. C. Gordon, Jr.
Journal of the Fisheries Research Board of Canada, Vol 30, No 8, p 1039-1046, August 1973. 5 fig, 4 tab, 8 ref.

Descriptors: *Pollutant identification, *Oil pollution, *Monitoring, Sampling, Calibrations, Separation techniques, Storage, Evaporation, Filtration, Water analysis, *Sea water, Oil spills, Equipment, Fluorescence.
Identifiers: Sample preparation, *Fluorescence spectroscopy, Petroleum oil, Gas liquid chromatography, Ultraviolet spectroscopy, Fuel oil, Crude oil, On board analysis.

Because of the potential usefulness of fluorescence spectroscopy for monitoring oil in seawater, studies were conducted to develop optimum procedures and identify limitations. Calibration, extraction, storage of extracts, and evaporation procedures were examined using seawater spiked with one of three kinds of oil or with polluted natural samples. Based upon the studies, recommended procedures were developed as briefly described. Samples should be collected in a clean plastic bucket or PVC Niskin sampling bottle and transferred to a 2-l polyethylene bottle. All glassware should be cleaned and rinsed with methylene chloride. Samples should be extracted twice with methylene chloride in a separatory funnel. Extracts should be drained into a glass bottle, sealed, and stored in the dark at low temperature until analysis. At analysis, water should be removed from the sample by a separatory funnel, methylene chloride removed in a rotary evaporator at 30C and reduced pressure, and the residue taken up with n-hexane. This solution is excited at 310 nm and the fluorescence measured at 374 nm. Comparison of the method with elemental analysis, uv spectroscopy, and GLC showed that for monitoring many samples it was sensitive and rapid. However, some limitations must be observed. Results of analysis of samples from several coastal inlets and along a section between Halifax and Bermuda show the usefulness of the method. (Little-Battelle)

GAS CHROMATOGRAPHIC PROCEDURE TO ANALYZE AMINO ACIDS IN LAKE WATERS,
Wisconsin Univ., Madison. Water Chemistry Program.
W. S. Gardner, and G. F. Lee.
Environmental Science and Technology, Vol 7, No 8, p 719-724, August 1973. 4 fig, 7 tab, 10 ref.

Descriptors: *Gas chromatography, *Methodology, *Chemical analysis, *Water analysis, Lakes, *Amino acids, Isolation, Evaluation, Cation exchange, Pollutant identification, *Wisconsin.
Identifiers: Dissolved free amino acids, *Sample preparation, Chemical recovery, Method evaluation, Precision, Accuracy, Ion exchange chromatography, Ligand exchange chromatography, Derivatives, Flame ionization gas chromatography, N-trifluoroacetyl methyl esters, *Lake Mendota (Wis.), Glycine, Alanine, Valine, Isoleucine, Threonine, Leucine, Serine, Proline, Tyrosine, Lysine, Phenylalanine, delta-Amino valeric acid, Error sources, Coefficient of variation.

A gas chromatographic procedure for the determination of free amino acids in lake water samples or hydrolyzates has been developed. A combination of ligand exchange and ion exchange chromatography was used to isolate and concentrate the amino acids from water samples. A semimicro derivative preparation technique was developed where the N-trifluoroacetyl methyl ester derivatives were formed. Recovery of the standard amino acids ranged from 53-93 percent. Poor recoveries were obtained for phenylalanine and lysine. Studies were made with fortified water samples to evaluate the precision and percent recovery of amino acids obtained with gas chromatographic procedures. The coefficients of variation generally were found to range between 5 and 20 percent for the various amino acids in the different procedures. The percent recoveries varied considerably among the respective amino acids. A brief experiment with frozen lake water filtrates suggested that freezing lowered the recovery of dissolved free amino acids. It was concluded that gas chromatography could be used to analyze lake water for selected amino acids after appropriate purification of the samples. The relative speed of analysis offers a distinct advantage over other available procedures, but more work is needed to improve the precision and accuracy of the described procedures and to permit analysis of the remaining common protein amino acids. (Holoman-Battelle)
W74-00061

THE PROBABLE OCCURRENCE OF HYDROXYLAMINE IN THE WATER OF AN ETHIOPIAN LAKE,
Haile Sellassi I Univ., Addis Adaba (Ethiopia). Faculty of Science.
R. M. Baxter, R. B. Wood, and M. V. Prosser.
Limnology and Oceanography, Vol 18, No 3, p 470-472, May 1973. 1 tab, 14 ref.

Descriptors: *Alkaline water, *Water analysis, *Pollutant identification, Lakes, Nitrites, Anions, Hydrogen ion concentration, Chemical analysis, Ammonia, Nitrates, Dissolved oxygen, Water sampling, Depth, Nitrogen compounds.
Identifiers: *Hydroxylamine, *Ethiopia (Lake Pawlo).

Fresh samples of water from all depths of Lake Pawlo, a moderately alkaline Ethipoian crater lake, frequently showed a marked increase in nitrite ion content after brief boiling. This did not occur, or was greatly reduced, in samples kept overnight before boiling. It is suggested that this was due to the presence of hydroxylamine. At the original pH of the water, oxidation of the hydroxylamine in the samples leads to nitrous oxide. When the sample is boiled, carbon dioxide is driven off and pH is increased. At this higher pH the oxidation of hydroxylamine follows a different pathway. Hydroxylamine may be a more frequent constituent of lake waters than has been assumed. (Holoman-Battelle)

IDENTIFICATION OF CUTIN, A LIPID BIOPOLYMER, AS SIGNIFICANT COMPONENT OF SEWAGE SLUDGE,
Washington State Univ., Pullman. Dept. of Agricultural Chemistry.
P. E. Kolattukudy, and R. E. Purdy.
Environmental Science and Technology, Vol 7, No 7, p 619-622, July 1973. 5 fig, 16 ref.

Descriptors: *Lipids, *Sewage sludge, *Pollutant identification, Methodology, Solvent extractions, Chemical analysis, Domestic wastes, Organic compounds.
Identifiers: *Cutin, *Biopolymers, Aliphatic hydrocarbons, Thin layer chromatography, GC-Mass spectrometry, Sample preparation, Hydrogenolysis, Organic solvents, Alkanes, Mass spectra.

Sewage sludge, the end product of digestion in a domestic waste treatment plant, was thoroughly extracted with organic solvents. The residue on hydrogenolysis with $LiAlH_4$ gave polyhydroxy alkanes which accounted for 12-28 percent of the organic matter in the sludge. The major hydroxy alkanes were identified by means of chromatographic techniques in conjunction with mass spectrometry to be 1,18-dihydroxyoctadecene, 1,9,18-trihydroxy- and 1,10,18-trihydroxyoctadecane, 1,9,18-trihydroxy- and 1,10,18-trihydroxyoctadecene, 1,9,19,18-tetrahydroxyoctadecane, 1,9,10,18-tetrahydroxyoctadecene, 1,7,16-trihydroxyhexadecane, and 1,8,16-trihydroxyhexadecane. The structure and distributions of these components are unique and typical of the lipid polymer cutin. (Holoman-Battelle)

WATER TEMPERATURE SURVEYS IN THE VICINITY OF POWER STATIONS WITH SPECIAL REFERENCE TO INFRA-RED TECHNIQUES,
Central Electricity Generating Board, Leatherhead (England). Central Electricity Research Labs.
D. J. Moore, and K. W. James.
Water Research, Vol 7, No 6, p 807-820, June 1973. 6 fig, 1 append.

Descriptors: *Water temperature, *Surveys, *Methodology, *Measurement, *Nuclear powerplants, Equipment, On-site investigations, Cooling water, Aerial photography, Powerplants, On-site tests, Water pollution effects, Surface waters, Thermometers, Depth, Infrared radiation, Isotherms, *Thermal pollution, Water analysis, Model studies.
Identifiers: *Infrared imagery, Thermistors, Airborne scanning, Sensors, Accuracy, Sensitivity, Infrared line scanner, Isodensitracers.

The use of three techniques for measuring water temperature is described in the context of field trials, at Berkeley Nuclear Power Station, made in 1967. Two of the techniques measure only the surface temperature of the water, the third using thermistors can record the temperature at varying depths. The techniques are complementary, but the infra-red line scan method has the great advantage of presenting a global picture of the surface temperature in a readily-digested form. Field experiments using these techniques can be most helpful in validating model studies and possible digital computer programs for examining the spread of warm water from power station cooling-water systems. GAS CHROMATOGRAPHIC DETERMINATION OF ALIPHATIC AMINES AND QUANTITATIVE ANALYSIS OF SMALL AMOUNTS OF DIMETHYLAMINE IN WASTEWATER,
Uniroyal Ltd., Guelph (Ontario). Research Labs.
F. I. Onuska.
Water Research, Vol 7, No 6, p 835-841, June 1973. 6 fig, 4 tab, 4 ref.

Descriptors: *Methodology, *Waste water (Pollution), *Chemical analysis, *Aqueous solutions, *Pollutant identification, Sewage, Industrial wastes, Water analysis, Pollutants, *Gas chromatography.
Identifiers: *Aliphatic amines, Flame ionization gas chromatography, Quantitative analysis, Retention time, Accuracy, Sensitivity, Dialkylamines, Trialkylamines, Monoalkylamines, Flame ionization detectors, Methylamine, Ethylamine, n-

Propylamine, n-Butylamine, Dimethylamine, Diethylamine, Ditn-butylamine, Trimethylamine, Triethylamine, n-Heptane, Di-n-propylamine, Tri-n-propylamine, Dibutylamine, Tributylamine.

A gas chromatographic procedure has been developed for the direct quantitative determination of primary, secondary and tertiary amines up to C4 in dilute aqueous solution. Industrial wastewater samples containing dialkylamines and standard dialkylamine solutions were analyzed by flame ionization gas chromatography using Pennwalt 223 amine packing for the columns which is stable to water and permits the separation of the amines in industrial wastewater and sewage. The method is sensitive, specific and free from the interferences of common low volatile degradation products in sewage. Kovats' retention indices are presented for C1-C4 mono-, di-, and trialkylamines and the response factors for dialkylamines using the FID detector are given. The linearity of the FID detector was also established for dimethylamine over the concentration range of 10-4000 mg/1. (Holoman-Battelle)

EXHAUSTIVE CHLORINATION AS A TECHNIQUE IN THE ANALYSIS OF AROMATIC HYDROCARBONS,
National Research Council of Canada, Halifax (Nova Scotia). Atlantic Regional Lab.
O. Hutzinger, W. D. J. Jamieson, S. S. Safe, and V. Z. Zitko.
Journal of the Association of Official Analytical Chemists, Vol 56, No 4, p 982-986, July 1973. 2 fig, 1 tab, 26 ref.

Descriptors: *Chemical analysis, *Methodology, Pollutant identification, Chemical reactions, Organic compounds, Chemical properties, Aromatic compounds, Polychlorinated biphenyls, *Chlorination.
Identifiers: *Aromatic hydrocarbons, Reagents, *Perchlorination reactions, Polycyclic compounds, Aroclor 1254, Decachlorobiphenyl, Trichlorosulfur tetrachloroaluminate, Dibenzofuran, Halowax 1014, Naphthalene, BMC, o-Tetradecachloroterphenyl, Polychlorinated terphenyls, Isomers, m-Tetradecachloroterphenyl, p-Tetradecachloroterphenyl, Anthracene, Octachloroanthraquinone, Antimony pentachloride iodine, Decachlorodiphenyl ether.

Perchlorination reactions of aromatic compounds have been further investigated. The preparation and properties of decachlorodiphenyl ether and the isomeric o-, m-, and p-tetradecachloroterphenyls are described. Anthracene, as an example of a polycyclic aromatic hydrocarbon, gave octachloroanthraquinone when treated with the antimony pentachloride iodine reagent, but quantitative conversion to decachloroanthracene could not be obtained with reagent BMC (sulfurylchloride-aluminum chloride-sulfur monochloride). A new reagent, trichlorosulfur tetrachloroaluminate (SCl3 (+)) A1C14 (-)), was shown to convert Aroclor 1254 to decachlorobiphenyl. As an application of the perchlorination technique it was shown that polychlorodibenzofurans (dibenzofuran) are not present at 0.5 microgram/g in samples of Halowax 1014 and technical naphthalene, respectively. Well defined derivatives could not be obtained when phthalate esters or 'hexabromobiphenyl' (fireMaster BP-6) were treated with the BMC or SbC15-I2 reagents. (Holoman-Battelle)

WATER POLLUTION,
Geological Survey, Washington, D.C.
C. J. Robinove.
In: The Nation's Environment--Problems and Action, p 60-69, (1971). East Tennessee State University, Johnson City. 2 fig, 2 photo.

Descriptors: *Pollutant identification, *Analytical techniques, Thermal pollution, Water pollution sources, Pollutants, Water pollution control, *Remote sensing, Analytical techniques, Environmental effects.

Water pollution is a public problem and its solution requires public understanding, public motivation, and public action. The effective solution of pollution problems requires a greater knowledge and understanding of the world. Pollution may be distinguished as either physical pollution or biological pollution based on whether the consideration is the usability of water for particular uses or the usability of the water environment. The Cuyahoga River in Ohio is used as an example of the multiplicity of pollution problems associated with water. Discussed in this context are such factors as sediment, pollutant detection, pollutant measurement, source determination, assessments of effects. A river in the Delaware estuary is used as an example of thermal pollution, the Santa Barbara oil slick is used to illustrate the application of infra red photography to pollution identification, and the Imperial Valley of California is discussed as an example of vegetation, water, and land form identification. Application of new techniques is stressed as an effective way of expanding man's understanding of his environment as a necessary precondition to water pollution control. (Wadley-Florida)

WATER CHEMISTRY OF ELLICOTT CREEK, WESTERN NEW YORK,
Calspan Corp., Buffalo, N.Y.
M. W. Van Lier.
Paper presented at the 16th Conference on Great Lakes Research, April 16-18, 1973; 17 p, 4 fig, 1 tab, 7 ref.

Descriptors: *Water chemistry, Streams, Streamflow, *New York, Water temperature, Hydrogen ion concentration, Seasonal, *Dissolved oxygen, *Alkalinity, *Chlorides, *Conductivity, *Phosphorus.
Identifiers: Ellicott Creek (N.Y.).

Of the streams found in western New York State, the greatest contrast in quality with respect to both upstream-downstream changes and high-low flow changes, occur on Tonawanda and Ellicott Creeks. The latter body of water was the subject of an intensive six month investigation to determine changes in selected chemical variables occurring over the entire length of the stream. Temperature, dissolved oxygen, pH, alkalinity, chlorides, conductivity, and total phosphorus were measured biweekly at pre-selected stream locations. Marked seasonal changes occurred in all variables measured. Concentrations were notably affected by varying discharge rates in the stream. Pronounced diurnal variations were noted in temperature, oxygen, and pH values measured during a continuous 24 hour study. (Calspan)

PETROCHEMICAL ANALYTICAL PROBLEMS. II. GAS-LIQUID CHROMATOGRAPHIC-MASS SPECTROMETRIC INVESTIGATION OF INDUSTRIAL DODECYLBENZENES,
Magyar Tudomanyos Akademia, Veszprem. Research Group for Petrochemistry.
I. Otvos, S. Iglewski, D. H. Hunneman, B. Bartha, and A. Balthazar.
Journal of Chromatography, Vol 78, No 2, p 309-316, April 25, 1973. 2 fig, 6 tab, 18 ref.

Descriptors: *Chemical analysis, *Pollutant identification, Methodology, Chemicals, Organic compounds, Aromatic compounds.
Identifiers: *GC-Mass spectrometry, *Industrial dodecylbenzenes, *Petrochemicals, Characterization, Chemical composition, Flame ionization gas chromatography, Molecular weight, Sensitivity, Aromatic hydrocarbons, Dodecylbenzenes, Linearil, Marlikan, Dobane JN, DDB, 2-Methyl-2-phenyldecane, 2-Methyl-2-phenylundecane, 2-Methyl-2-phenyldodecane, Alkylindanes, Alkyltetralins, Undecylbenzenes, Aliphatic hydrocarbons.

The industrial dodecylbenzenes Linearil, soft and hard DDB, Marlikan, and Dobane JN were studied by gas-liquid chromatography - mass spectrometry (GLC-MS). Osmometric average molecular weights were measured with a Knauer vapor tension osmometer in benzene solution. The components of samples containing linear alkyl groups could be identified. The average molecular weights calculated from the measurements agree with independent molecular weight data. On the basis of the experimental data obtained, the following conclusions were reached: (1) The combined GLC-MS method provides reliable qualitative and quantitative analytical data for the most important characteristics of linear chain detergent alkylates, even when using a simple GLC-MS system. (2) The GLC-MS data could be controlled by independent methods and good agreement was found. (3) For branched chain products, the GLC-MS measurement yields only qualitative results of indicative character. The qualitative data may have some significance when making decisions regarding the applications of the substances, but it is more important to know the average molecular weight, which can be obtained only by other physical methods until the GC resolution can be significantly improved. (4) Alkyliadanes and/or alkyltetralins could be detected in each LB sample. (5) According to the molecular weight determinations, the products investigated are undecylbenzenes on average, but according to the literature data a mean carbon number of ca. 12.5 could be expected in the alkyl chain. (6) Unequivocal evidence could be obtained that within the sensitivity limits of the measurements (ca. 0.05 percent) on the products sold as biodegradable, 'soft' products, no branched chain isomers are to be found. GAS-LIQUID CHROMATOGRAPHY-MASS SPECTROMETRY OF ORGANOMERCURY COMPOUNDS,
Environmental Protection Agency, Athens, Ga. Southeast Environmental Research Lab.
G. L. Baughman, M. H. Carter, N. L. Wolf, and R. G. Zepp.
Journal of Chromatography, Vol 76, No 2, p 471-476, February 28, 1973. 2 fig, 2 tab, 22 ref.

Descriptors: *Pollutant identification, Chemical analysis, Chemical degradation, Degradation (Decomposition).
Identifiers: *Organomercury compounds, *GC-Mass spectrometry, *Gas liquid chromatography, Retention time, Flame ionization gas chromatography, Electron capture gas chromatography, Organomercurials, Methylmercury, Phenylmercury, Dimethylmercury, Methylmercuric iodide, Methylmercuric hydroxide, Phenylmercuric acetate, Methylmercuric bromide, Methylmercuric acetate, Methylmercuric chloride, Phenylmercuric chloride, Phenylmercuric borate, Diphenylmercury, Phenylmercuric hydroxide.

Gas-liquid chromatography-mass spectrometry (GLC-MS) was used to study GLC behavior of organomercury compounds, specifically, dimethylmercury and methylmercuric salts and phenylmercury compounds. For reference the compounds were chromatographed using flame ionization and electron capture detectors. Analyses of the methylmercury and phenylmercury compounds were performed, respectively, on 6 ft by 1/4 in glass columns containing Chromosorb W coated with 5 percent diethyleneglycol succinate and 3 percent OV-I on Chromosorb W. The data confirmed that at low concentrations all methylmercury salts give peaks having the same retention time and that ionic methylmercury compounds undergo decomposition during GLC. The decomposing proportion appears to increase as the sample size decreases. The phenylmercury salts, even at large sample sizes, decompose to give diphenylmercury (DPM) as the major product. Reliable analyses for methylmercury salts may be achieved using GC but only if specially treated columns are used to make the decomposition reactions reproducible. Since phenylmercury salts decompose extensively, GLC is not a good method for their analysis. (Holoman-Battelle)

Identifiers: *Thin layer chromatography, *Enzyme inhibition techniques, Biological samples, Detection limits, Sensitivity, Environmental samples, Aldicarb, Banol, Carbaryl, Carbofuran, Carbofuran 3-OH, Matacil, Metasystox-R, Mesurol, Tranid, Zectran, Baygon, Ethion, Malathion, Parathion, Alkaline phosphatase, Acid phosphatase, Dicofol, Methoxychlor, Perthane, Benzene hexachloride, Lindane, Isodrin, Heptachlor epoxide, Chlordane, Thiometon, Isobenzan, Endosulfan, Toxaphene, Nitrophenyl phosphate, Naphthyl phosphate, Methomyl, Demeton, Fenthion, Oxydemeton methyl, Dimethoate.

Thin-layer chromatography continues to be an integral part of analytical chemistry because it is versatile, sensitive, simple and rapid. The application of enzymatic methods to thin-layer chromatography is becoming more important. This chromatographic-enzymatic technique has been developed for studies of metabolic pathways of pesticides, residue analyses and forensic chemistry. The discussions deal with the development of chromatographic techniques using enzymatic reactions to detect pesticides and other biologically active compounds, principles of the technique, comparison of detection limits by various methods and enzymes, and practical applications of the technique and methods of quantitation. ULTRATRACE ANALYSIS (BELOW P.P.B.) BY COUPLING CENTRIPETAL THIN-LAYER CHROMATOGRAPHY AND GAS CHROMATOGRAPHY,
Ceskoslovenska Akademie Ved, Brno. Ustav Instrumentalni Analyticke Chemie.
J. Janak, V. Martinu, and J. Ruzickova.
Journal of Chromatography, Vol 78, No 1, p 127-131, April 11, 1973. 2 fig, 4 ref.

Descriptors: Methodology, *Chemical analysis, *Pollutant identification, Chlorinated hydrocarbon pesticides, Plant tissues, Pesticide residues, Gas chromatography, Insecticides, Laboratory tests.
Identifiers: *Trace levels, *Lindane, *Centripetal thin layer chromatography, *Electron capture gas chromatography, Detection limits, Sensitivity, Biological samples.

A method for the determination of ultratrace amounts of lindane by centripetal thin-layer chromatography combined with gas chromatography under common laboratory conditions is described. The method was used for the determination of pesticide contents in the dry material obtained from cabbage from a trial field. The accuracy of the analysis under conditions easily available in routine work is 0.1 ppb. The sensitivity limit of the method is 0.001 ppb with analytical precision. The combination of flat-bed and column techniques, suggested and represented by thin-layer centripetal chromatography plus GC with an electron-capture detector, will be most useful for ultratrace analysis. The possibility of processing relatively large volumes of solvents containing minute amounts of compound to be analyzed, without prior purification, will permit the wider utilization of the technique in the analysis of extracts of biological materials. CADMIUM CONCENTRATIONS IN SOME FISH SPECIES FROM A COASTAL AREA IN SOUTHERN NORWAY,
Norges Veterinarhoegskole, Oslo. Dept. of Biochemistry.
G. N. Havre, B. Underdal, and C. Christiansen.
Oikos, Vol 24, No 1, p 155-157, 1973. 1 tab, 7 ref.

Descriptors: Freshwater fish, Saline water fish, *Chemical analysis, *Cadmium, *Pollutant identification, Methodology, Herrings, Perches, Pikes, Heavy metals, Coasts, Solvent extractions, *Spectrophotometry.
Identifiers: *Atomic absorption spectrophotometry, Cod (Fish), Whiting, Coalfish, Animal tissues, Fat tissue, Bioaccumulation, *Norway, Sample preparation.

The method and results are reported for the analysis of fish for the presence of cadmium. Fish caught in a Norwegian coastal area were stored at minus 20C until analysis by atomic absorption spectrophotometry. Sample preparation involved homogenizing, wet ashing, adjusting the pH to 3.0, buffering, and solvent extraction using a mixture of APDC (ammonium pyrrolidine dithiocarbamate) and MIBK (methyl isobutyl ketone). The cadmium concentrations were low, varying from 0.003 to 0.012 microgram/g wet weight in cod, and from 0.002 to 0.029 microgram/g, and 0.003 to 0.033 microgram/g, in whiting and herring, respectively. The results could indicate a slightly greater accumulation of cadmium in fat fish as compared to lean fish. No correlation seems to exist between the cadmium concentration and the total weight of the fish. (Holoman-Battelle)

COMPOSITIONAL STUDIES OF A HIGH-BOILING 370-535 C DISTILLATE FROM PRUDHOE BAY, ALASKA, CRUDE OIL,
Bureau of Mines, Bartlesville, Okla. Bartlesville Energy Research Center.
H. J. Coleman, J. E. Dooley, D. E. Hirsch, and C. J. Thompson.
Analytical Chemistry, Vol 45, No 9, p 1724-1737, August 1973. 10 fig, 7 tab, 18 ref.

Descriptors: *Chemical analysis, Methodology, Pollutant identification, *Distillation, Organic compounds, *Alaska, Nuclear magnetic resonance, Aromatic compounds, Chemical degradation, Sulfur, Nitrogen, Separation techniques, Physical properties.
Identifiers: Chemical composition, *Crude oil, *Petroleum distillates, Boiling point, *Prudhoe Bay (Alas), *Oil characterization, Aromatic hydrocarbons, Gel permeation chromatography, Silica gel adsorption chromatography, Alumina gel adsorption chromatography, NMR spectra, Sample preparation, Petroleum residues, Light gasoline, Naphtha, Gas oil, Kerosene, Paraffins, Naphthenes.

In addition to providing some of the general characteristics of the Prudhoe Bay, Alaska, crude oil as determined by the Bureau of Mines routine method of analysis, this paper presents a com-

prehensive analytical characterization of a high-boiling 370y535C distillate. Following distillate preparation by several distillation steps in special distillation equipment, careful separating procedures with ion-exchange resins, coordination-complex formation of neutral nitrogen compounds with ferric chloride, and dual silica-alumina gel adsorption provided suitable concentrate fractions for further study. Subdivision of aromatics into three major aromatic types-monoaromatics, diaromatics, and polyaromatics-polar-greatly simplified subsequent separation and characterization studies. Monoaromatic, diaromatic, and polyaromatic-polar concentrates combined represent a large portion (45.5 percent) of the 370-535C boiling range distillate of the Prudhoe Bay, Alaska, crude oil, the importance of which justified detailed determinations of the number of rings involved, the relative aromaticity, and the degree of condensation of aromatic, naphthene, or heterocyclic rings. Further analytical separations by GPC, followed by determination of mass and NMR spectral data on the resulting GPC subfractions, provided a basis for determining a much more intelligible and reasonable understanding of compound type distributions for this specific high-boiling 370-535C Prudhoe Bay, Alaska, crude oil distillate. The end result is a scheme of sample preparation, analysis, and characterization that should be applicable to similar high-boiling distillates from other crude oils and of value to the petroleum industry in studies related to the origin of petroleum as well as its production, processing, storage, and usability. A STUDY OF THE VARIATION WITH PH OF THE SOLUBILITY AND STABILITY OF SOME METAL IONS AT LOW CONCENTRATIONS IN AQUEOUS SOLUTION. PART II,
Imperial Chemical Industries Ltd., Northwich (England). Winnington Lab.
A. E. Smith.
Analyst, Vol 98, No 1164, p 209-212, March 1973. 3 tab, 6 ref.

Descriptors: *Aqueous solutions, *Cations, *Metals, *Pollutant identification, Hydrogen ion concentration, Stability, Solubility, Water storage, Methodology, Physical properties, Adsorption, Gold, Cadmium, Variability.
Identifiers: *Atomic absorption spectrophotometry, *Rare earth elements, *Trace levels, Barium, Bismuch, Indium, Lithium, Paladium, Platinum, Rhodium, Ruthenium, Antimony, Tin, Thallium, Chemical concentration.

Atomic-absorption spectrophotometry was used to determine trace levels of metal ions in aqueous solution containing 0.5 percent m/v of sodium chloride in order to investigate the effect of pH upon their stability, solubility and ease of adsorption during storage. Of the thirteen metal ions investigated, namely those of gold, barium, bismuth, cadmium, indium, lithium, palladium, platinum, rhodium, ruthenium, antimony, tin and thallium, with the exception of lithium, none is stable over the pH range from 1 to 11. To ensure the stability of solutions containing these ions it is necessary to acidify them to pH 1 with hydrochloric acid immediately after sampling. (Holoman-Battelle)

THE P-VALUE APPROACH TO QUANTITATIVE LIQUID-LIQUID EXTRACTION OF PESTICIDES AND HERBICIDES FROM WATER. 3. LIQUID-LIQUID EXTRACTION OF PHENOXY ACID HERBICIDES FROM WATER,
Drexel Univ., Philadelphia, Pa. Dept. of Chemistry.
I. H. Suffett.
Journal of Agricultural and Food Chemistry, Vol 21, No 4, p 591-598, July/August 1973. 1 fig, 10 tab, 25 ref.

Descriptors: *Solvent extractions, *Separation techniques, *Herbicides, *Pollutant identification, *Chlorinated hydrocarbon pesticides, Aqueous solutions, Methodology, Pesticide residues, Water pollution, Ethers, 2 4 5-T, 2 4-D, Adsorption, Dalapon, Gas chromatography, Water analysis, Chemical analysis, Rivers.
Identifiers: *Liquid-liquid extraction, Chemical recovery, Isopropyl ester, n-Butyl ester, Distilled water, Natural waters, Ethyl acetate, Organic solvents, Benzene, Esters, MCPA, 2-CPA, 4-CPA, 2 4-DB, Silvex, Ultraviolet spectrophotometry, Electron capture gas chromatography.

The goal of aqueous herbicide analysis is the recovery of 100 percent of an herbicide for qualitative and quantitative analysis. Liquid-liquid extraction is the method of choice for quantitative recovery from water. The p-value concept is useful in developing an understanding of the liquid-liquid extraction process in order to select optimum experimental conditions to approach 100 percent herbicide recovery. The best solvents for extraction of phenoxy acid herbicides are ethyl acetate and ether. The best solvents for simultaneous extraction of 2,4-D or 2,4,5-T and their n-butyl and isopropyl esters are ether and ethyl acetate (2,4-D and esters) and benzene (2,4,5-T and esters). Possible variation of the p-value caused by alteration of natural water characteristics was tested. The apparent p-values for 2,4-D obtained with waters from different sources and the p-value found in distilled water were found to be consistent. Adsorption characteristics of herbicide esters were changed upon adjustment of turbid water to the aqueous characteristics of the p-value method. Therefore the aqueous sample should be filtered before adjustment of aqueous conditions for liquid-liquid extraction. The p-value gives a theoretical guide (an F sub n value) for development of an aqueous residue procedure. Recovery data from the literature and a recovery study at high concentration confirmed the calculated F sub n value. A two-step serial extraction with 200 and 50 ml of ethyl acetate under p-value conditions is the choice for extracting 99 percent of 2,4-D from 1 1. of aqueous solution. THE INFLUENCE OF AN INDUSTRIAL PLANT ON THE CHEMISTRY OF QUATERNARY WATERS IN ITS VICINITY, UPPER ODRA RIVER VALLEY, (IN POLISH),
Academy of Mining and Metallurgy, Krakow (Poland). Inst. of Hydrogeology and Engineering Geology.
A. S. Kleczkowski, and J. Kowalski.
Bull Acad Pol Sci Ser Sci Terre. Vol 20, No 1, p 65-70. 1972.
Identifiers: Industrial wastes, *Poland (Upper Odra River), Quaternary waters, Rivers, Valley, Water pollution, Air pollution, *Chemical wastes.

From an area of 100 square km surrounding a chemical plant, more than 400 samples of water were taken in monthly series (1969-1970). In the non-isolated water-bearing horizon, marked changes in the chemical composition of water down to 15 m depth were established (SO4, Cl, Na + K, NO3 mineralization). This is connected with hydrochemical characteristic zonality and extension of pollution by chimney exhalations into the atmosphere and their infiltrations (S and N).--Copyright 1973, Biological Abstracts, Inc.

An improved extraction procedure can be used to extract dispersed oils from water for quantitative

analysis by infrared spectrophotometry. This procedure involves the addition of 50 percent H2SO4 and HCl to 1-liter samples and extraction with four 25-ml portions of Freon 113 in 2-liter separatory funnels. Checks for acidity (below pH 3) and completeness of extraction should be made. A 'blank' determination is recommended for reagents and water in order to prevent interference with the oil measurement at 2930/cm by extraneous solvent extractable organics. Some of the parameters that optimize such extractions were examined. The organic solvents trichlorotrifluoroethane and carbon tetrachloride were compared in relation to extraction efficiency. Both solvents were found to be useable for the infrared determination of oil and to be about efficient in extracting dispersed oils. However, trichlorotrifluoroethane (Freon 113) is preferred since it is much less poisonous to laboratory personnel. Changes in extraction efficiency following small additions of sulfuric acid and sodium chloride were examined. Great improvement results in extraction efficiency, but no further improvement derives from addition of more salt. (Holoman-Batelle)

THE DETERMINATION OF CHROMIUM IN HUMAN URINE BY GAS CHROMATOGRAPHY USING A FLAME PHOTOMETRIC DETECTOR WITH A 425, 4 NM FILTER,
Environmental Protection Agency, Perrine, Fla. Perrine Primate Lab.
R. Ross, and T. Shafik.
Journal of Chromatographic Science, Vol 11, No 1, p 46-48, January 1973. 3 fig, 2 tab, 18 ref.

Descriptors: *Chromium, *Urine, *Chemical analysis, *Pollutant identification, *Gas chromatography, Heavy metals, Methodology, Pollutants, Monitoring, Aqueous solutions.
Identifiers: *Flame photometric gas chromatography, Biological samples, Chemical recovery.

The determination of low levels of chromium as chromium (III) trifluoroacety lacetonate has been previously achieved by GC using an electron capture detector. Conventional detectors, such as the electron capture detector, are sensitive but not very specific. Replacement of this detector system with a flame photometric detector equipped with a 425.4 nm filter (specific for chromium) affords both the sensitivity and specificity necessary for monitoring levels of chromium in human urine samples. The detector is linear in the range of 0 to 90 nanograms of chromium. Determination of chromium in human urine using this system has the advantages of greater specificity and linear range, as compared with other GC detector systems. The sensitivity of this system is adequate for monitoring levels of chromium in human urine. (Holoman-Battelle)

Identifiers: Chemical interference, Precision, Detection limits, Gallium, Sample preparation, Oxine.

An indirect fluorometric procedure has been described for determining trace amounts of nitrilotriacetic acid (NTA) in water. This method is based upon the reaction of NTA with the Fluorescent Ga (III)-8-hydroxyquinoline complex. In order to obtain good results, the reagents should be added in this sequence: Ga (III, oxine, buffer, NTA, and then extraction. Interference studies showed that iron greatly interferes with this analytical procedure. Tap water samples were analyzed with a relative standard deviation of 10 percent or less. This method is relatively fast and does not require expensive equipment. (Holoman-Battelle)

Identifiers: *Trace levels, *Flameless atomic absorption spectrophotometry, Detection limits, Absorbance, Sensitivity, Sample size.

An extremely efficient purging technique is described which makes use of inexpensive equipment to measure sub-part-per-billion concentrations of mercury rapidly and over a wide range of sample sizes. The components of the apparatus are a regulated source of purge gas, flowmeter (100-1000 ml/min range), Pyrex Buchner-type funnel, and a 10-15 cm absorption cell with windows transparent at 253.7 nm. The treated sample is placed in the funnel to which is added the tin (II) reducing agent. The funnel is quickly stoppered and the purging gas and recorder are tuned on. When the pen returns to the base line, the gas flow is stopped and either a new sample added or a dilute mercury (II) chloride standard is injected in the reduced sample. The gas is again turned on and the absorbance measured. With the method described, 25 ng of mercury in a 100-ml sample with 5 ml of reductant purged at a gas flow rate of 16 ml/s in a 150-ml Buchner funnel gave a signal which reached maximum in 10 s and returned to base line in about 75 s. This peak height was 50 percent greater than the steady-state maximum (reached in about 1 min) obtained on an identical sample when the recirculation pump system and 300-ml BOD bottle sample holder supplied with a MAS 50 was used. Funnels of 30-, 60- and 150-ml capacity were used for sample sizes of 2-100 ml. Over this range several trends were observed: (1) The smaller the sample, the better the absolute sensitivity of the system. The detection limit for a 5-ml sample was 0.6 ng, but for a 50-ml sample, 2 ng. (2) The larger the sample volume the better the relative sensitivity of the technique, from a 0.12-p.p.b. detection limit for a 5-ml sample to 0.04 p.p.b. for a 100-ml samples. Practical application has been made to measuring Hg present in seawater, marine sediments, fish and other marine organisms, and clothing material. (Holoman-Battelle)

STAPHYLOCOCCI AND MICROCOCCI IN SWIMMING-BATH WATER, (IN GERMAN),
L. Gruen, and H. Kleybrink.
Zentralbl Bakteriol Parasitenkd Infektionskr Hyg Erste Abt Orig Reihe B Hyg Praev Med. Vol 155, No 5, p 384-390. 1972. English summary.
Identifiers: *Micrococci, *Staphylococci, *Swimming baths, Water pollution, *E. coli.

Samples (224) of water collected from 3 swimming-baths were examined bacteriologically and chemically. With regard to the total numbers of organisms present and the Escherichia coliliters, the water from these swimming-baths was regarded as satisfactory. All samples contained micrococci and 34% of them contained pathogenic staphylococci, although the content of the water in chlorine was as high as 2 mg/l of Cl2. The cause for and the significance of the presence in the bathwater of staphylococci are discussed.--Copyright 1973, Biological Abstracts, Inc.

INFLUENCE OF HEATING RATE ON ANALYTICAL RESPONSE IN FLAMELESS ATOMIC ABSORPTION SPECTROMETRY,
Bari Univ. (Italy). Inst. of Analytical Chemistry.
G. Torsi, and G. Tessari.
Analytical Chemistry, Vol 45, No 11, p 1812-1816, September 1973. 1 fig, 12 ref.

Descriptors: *Analytical techniques, *Heating, Rates, *Chemical analysis, Chromium, Heavy metals, *Spectrometers, Performance, Temperature, Instrumentation, Evaporation, Theoretical analysis, Absorption.
Identifiers: *Flameless atomic absorption spectrophotometry, Graphite rod atomizer, Sensitivity, Detection limits.

A graphite rod flameless atomic absorption spectrometer was assembled with high chopping speed, fast response, and good noise rejection. The influence of the input power on the analytical sensitivity was investigated using chromium as a probe for rods of different geometrical dimensions. In satisfactory agreement with the theoretical model, a linear relationship was found between the peak absorption with both the input power and the thermal derivative at the evaporating surface. The possibility of obtaining kinetic information about the evaporation process is discussed. A new detection limit value, 2 picograms for chromium, is also reported. (Holoman-Battelle)

Descriptors: *Sea water, *Sediments, *Marine animals, *Gas chromatography, Chemical analysis, Water analysis, Marine fish, Separation techniques, Monitoring, Water pollution effects, Waste disposal, Atlantic Ocean, Pacific Ocean, Pollutant identification.
Identifiers: Rattail fish, Sea cucumber, Thin layer chromatography, Munitions, TNT, RDX, Tetryl, Ammonium perchlorate, Macroinvertebrates, Sample preparation, Biological samples.

Samples of seawater, sediment, and ocean bottom fauna (rat tail fish and sea cucumbers) were collected for analysis from two sites in the Atlantic and Pacific Oceans where surplus and obsolete munitions had been dumped. Samples were refrigerated during storage, then extracted with benzene and analyzed for TNT, RDX, and Tetryl using a combination thin layer and gas chromatography technique. Ammonium perchlorate was measured by its reaction with tetraphenylarsonium chloride which produced an insoluble perchlorate salt. No explosive contaminants were found in any of the samples analyzed. DETERMINATION AND DIFFERENTIATION OF ETHYLENEDIAMINETETRA-ACETIC ACID (EDTA) AND NITRILOTRIACETIC ACID (NTA) IN FRESHWATER,
Department of the Environment, Burlington (Ontario). Centre for Inland Waters.
K. L. E. Kaiser.
Water Research, Vol 7, No 10, p 1465-1473, October 1973. 2 fig, 4 tab, 40 ref.

Descriptors: *Nitrilotriacetic acid, *Spectrophotometry, *Pollutant identification, Analytical techniques, Water analysis.
Identifiers: *EDTA.

A fast and simple spectrophotometric method for the determination and differentiation of ethylenediaminetetra-acetic acid (EDTA) and nitrilotriacetic acid (NTA) is described. Principles, detection limits and interferences of other recent methods for the analysis of EDTA and NTA are briefly reviewed. The proposed method is based on the light absorption of cobalt (III) complexes of NTA and EDTA at 555 and 535 nm. After the determination of the sum of EDTA and NTA, the NTA complex is selectively oxidized. The absorbance then represents EDTA only. The sensitivity of the method is 10 micrograms; with preconcentration of the water sample by means of rotary evaporation a detection limit of 10 micrograms per liter is observed. (Knapp-USGS)

New media for the demonstration of gas and indole production in a single tube were compared with other media recommended for use in the 44 deg C confirmatory test for E. coli. The use of mannitol can reduce the numbers of false positive and false negative gas reactions. Indole-production tests may be performed in the same tube as the mannitol fermentation test by including tryptone in the medium. Tryptone mannitol ricinoleate broth and tryptone mannitol broth were most suitable for the confirmation of E. coli in coliform presumptive tubes and membrane filter colonies respectively. The results of the mannitol fermentation and indole-production tests are available within 24 h at 44 deg C. The media are inexpensive and simple to prepare. (Knapp-USGS)

DETECTION OF SALTS OF 2,4-D IN AQUEOUS SOLUTION BY LASTER RAMAN SPECTROSCOPY,
Kentucky Univ., Lexington. Dept. of Electrical Engineering.
J. M. Reeves, E. B. Bradley, and C. A. Frenzel.
Water Research, Vol 7, No 10, p 1417-1429, October 1973. 11 fig, 3 tab, 9 ref.

Descriptors: *2-4-D, *Herbicides, *Spectroscopy, *Pollutant identification, Water analysis, Analytical techniques, Instrumentation.
Identifiers: *Raman spectroscopy, Lasers.

Laser Raman spectroscopy was used to detect a salt of a herbicide, 2,4-dichlorophenoxy acetic acid, in water solution at concentrations as low as 500 ppm. The Raman spectrum of the powder is substantially different from the spectrum of the pollutant in aqueous solution. The spectrum of the potassium and sodium salts are the same for the powder or aqueous solution. Five strong bands exist in aqueous solution, and four of these bands are detectable at concentrations as low as 500 ppm. All spectra were excited with a 50 mW He-Ne gas laser at 6328 A. Lower concentrations should be detectable with a more powerful laser at a higher frequency because: (1) the intensity of the scattered radiation is proportional to the product of the intensity of the electric field perturbing the molecule and the fourth power of the scattered frequency; (2) the attenuation coefficient of water is less; (3) the photocathode used is more efficient at higher frequencies and (4) the monochromator grating used is blazed at 5000 A. The resonance Raman effect is a possible method for the detection and identification of small optimal concentrations of pollutant in water. (Knapp-USGS)

The feasibility of oil pollution source identification is demonstrated on eighty crude oils from the world's major oil fields. Measurements of fifteen diagnostic parameters were made on the 600+F fraction of the crude oil samples. Of the fifteen parameters studied it was demonstrated that six were sufficient to distinguish among the crude oils. These parameters are carbon and sulfur isotopic composition, sulfur, nitrogen, vanadium and nickel contents. A hydrocarbon gas chromatographic profile was also diagnostic for identification but its usefulness was reduced for aged samples by the effect of weathering. The other parameters studied were the saturate, aromatic and asphaltic contents and the carbon isotopic composition of each of these fractions, the n-paraffin distribution (odd-even predominance curves) and the sulfur gas chromatographic profile. The influence of weathering on the parameters was studied. A statistical procedure based on multivariate normal analysis was developed to compare an unknown with a data library and to give an unbiased match of the unknown with a known based on the precision of the measurement methods. THE EXTRACTION OF MERCURY FROM AQUEOUS SOLUTION WITH SULFIDE--TREATED POLYURETHANE FOAM,
Manitoba Univ., Winnipeg. Dept. of Chemistry.
M. A. J. Mazurski, A. Chow, and H. D. Gesser.
Analytica Chimica Acta, Vol 65, No 1, p 99-104, June 1973. 2 fig, 2 tab, 20 ref.

Descriptors: *Mercury, *Separation techniques, *Aqueous solutions, Heavy metals, Water analysis.
Identifiers: *Polyurethane foam, *Methylmercury, Chemical interference, Mercury chloride.

Polyurethane foam treated in an electrical discharge with hydrogen sulfide was shown to be very efficient for separating and concentrating mercury (II) chloride from aqueous solutions over the concentration range 4.0-0.0004 p.p.m. mercury. The foam removed methylmercury (II) chloride from aqueous solutions over the concentration range 2.0-0.0004 p.p.m. methylmercury, but somewhat less effectively. The results were reproducible, and the overall method appears very simple and inexpensive. This method would be very useful for concentrating very low concentrations of mercury from large volumes of water, for aqueous solutions pass easily through the foams at relatively high flow rates. These foams should make useful monitoring devices for mercury levels in industry, in environmental analysis and in the laboratory if quantitative removal of the mercury from the foams can be achieved. Results from Soxhleting the foams with 2 M hydrochloric acid, indicate that quantitative extraction and recovery of the mercury from the foams is possible. The effect of other ions competing against mercury for absorption does not appear to be important when these ions are at the levels generally found in tap water. This procedure is presently being extended to the selective extraction of other metals by the use of various complexing agents on various foams. (Little-Battelle)

THE RAPID DETERMINATION OF THE ORGANOPHOSPHORUS PESTICIDES DIAZINON AND DICHLORVOS IN BLOOD BY GAS CHROMATOGRAPHY,
Ministry of Agriculture, Fisheries and Food, Weybridge (England). Central Veterinary Lab.
A. F. Machin, M. P. Quick, and D. F. Waddell.
Analyst, Vol 98, No 1164, p 176-180, March 1973. 1 fig, 5 tab, 9 ref.

Descriptors: *Diazinon, *Pollutant identification, *Chemical analysis, Methodology, Phosphothioate pesticides, Chlorinated hydrocarbon pesticides, Organophosphorus pesticides, *Gas chromatography, Antihelminthes (Pesticides), Acaricides, Pollutants, Solvent extractions, Separation techniques.
Identifiers: Blood, Thermionic gas chromatography, *Dischlorvos, Chemical recovery, Sample preparation, Detection limits, Body fluids, Biological samples, Animal tissues.

A rapid method for the gas-chromatographic determination of diazinon and dichlorvos in blood is described. Protein is precipitated by mixing the blood with an excess of acetone containing an internal standard and the supernatant liquid is injected, directly or after concentration, into the gas chromatograph. A thermionic phosphorus detector is used. Recoveries are satisfactory from 0.1 ml of blood containing 0.1 ppm of the pesticide without concentration of the extract. If a 1-ml sample is used and the extract concentrated, 0.02 ppm can be determined. It is suggested that the method should be applicable to a wide range of organophosphorus pesticides. The method is also shown to be effective for determining diazinon in tissues and organs, but it is not recommended for this purpose. (Holoman-Battelle)

THE APPLICATION OF THE THIN-LAYER CHROMATOGRAPHIC - ENZYME INHIBITION TECHNIQUE TO ORGANOCHLORINE INSECTICIDES,
Institute of Forensic Research, Krakow (Poland).
M. Bogusz, and T. Borkowski.
Analyst, Vol 98, No 1164, p 190-193, March 1973. 2 fig, 1 tab, 11 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, Methodology, *Pollutant identification, Chemical analysis, *Insecticides, DDT, Heptachlor, Aldrin, Dieldrin, Endrin, *Chromatography.
Identifiers: *Enzyme inhibition technique, *Thin layer chromatography, Detection limits, Enzyme activity, Methoxychlor, p p' DDT, Lindane, Cholinesterase, Carboxylesterase, Enzymatic inhibitors, Esterases.

An investigation was conducted in order to evaluate the possible influence of organochlorine insecticides (active substances and formulations) on results obtained by the thin-layer chromatographic - enzyme inhibition technique and to elucidate the mechanism of such an influence. A modified method of Mendoza et al. (1969) was used with up to 30 micrograms of standards and corresponding formulations being spotted onto the plates. Enzyme (esterase) activity was measured in a dilute liver homogenate. By use of this technique, lindane in amounts of 500 ng or more is detected, whereas the other pesticides tested (p,p'-DDT, ethoxychlor, heptachlor, aldrin, dieldrin, and endrin) remain undetected up to 10 micrograms. Positive results for the tests for organophosphorus and carbamate pesticides with the thin-layer chromatographic - enzymatic technique therefore require corroboration from other tests to exclude the possibility of the presence of lindane. Kinetic enzymatic studies have shown that lindane is a non-competitive inhibitor of carboxylesterase, the predominant enzyme of liver homogenate, which is responsible for the hydrolysis of a chromogenic substrate. Lindane does not inhibit the cholinesterase in liver homogenate. (Holoman-Battelle)
W74-00461

A COMPARISON OF A WET PRESSURE DIGESTION METHOD WITH OTHER COMMONLY USED WET AND DRY-ASHING METHODS,
Colorado Div. Wildlife, Fort Collins.
W. J. Adrian.
Analyst, Vol 98, No 1164, p 213-216, March 1973. 3 tab, 3 ref.

Descriptors: Methodology, *Chemical analysis, *Metals, *Phosphorus, Separation techniques, Chemical degradation, Pollutant identification, Sampling.
Identifiers: *Sample preparation, Biological samples, *Chemical digestion, Wet ashing, Dry ashing, Precision, Hydrogen peroxide, Sulfuric acid, Artemisia tridentata.

A wet-digestion method for the determination of metals and phosphorus in biological material that involves the use of pressure is described and comparisons are made with the standard dry and wet-ashing methods and the sulphuric acid-hydrogen peroxide method. Big sage (Artemisia tridentata) was chosen as the test material. A 500-g sample was ground to a homogenous mixture and twenty-five 0.5-g subsamples were used for each method. The same acid stock was used for each method and all samples were predigested overnight with the exception of those being determined by the dry-ashing and sulfuric acid-hydrogen peroxide methods. The pressure method has the advantage of being able to digest many samples at the same time (to the extent that the cations sought and phosphorus can be extracted into dilute nitric acid) with very little equipment, small volumes of acid and with a low digestion temperature (that of hot tap water), with the precision of more laborious standard methods. (Holoman-Battelle)
W74-00462

DETERMINATION OF ORTHOPHOSPHATE,
Arizona Univ., Tucson. Coll. of Medicine.
R. Huxtable, and R. Bressler.
Analytical Biochemistry, Vol 54, No 2, p 604-608, August 1973. 4 fig, 1 tab, 8 ref.

Descriptors: *Colorimetry, *Phosphates, Assay, *Pollutant identification.
Identifiers: *Sample preparation, *Orthophosphates, Chemical interference.

The Fiske and SubbaRow colorimetric procedure for phosphate determination was modified by Baginski et al. In this method, further color development at the termination of reaction by additional release of phosphate is prevented by using a complexing agent. However, the presence of ATP suppresses color development. To eliminate this problem, the following procedure was developed: 1 ml of 5 percent trichloroacetic acid is added to the sample to be analyzed. Water is added to bring the volume to 3 ml; 0.5 ml of 2.5 percent ammonium molybdate followed by 0.2 ml of 0.2 percent aminonaphthol sulfonic acid (ANSA) are next added. After a 2-min interval, 1 ml of 2 percent sodium citrate and 2 percent sodium arsenite in 2 percent acetic acid is added. The solution is mixed, and left for 15 minutes. Optical density is then read at 750 nm. One micromole of phosphate gives a color reading of 0.736 OD in a 1-cm pathlength cell. (Little-Battelle)

THE CHEMISTRY AND QUANTITATIVE UTILITY OF SODIUM COBALTINITRITE IN THE DETERMINATION OF PHENOLS,
Iowa Univ., Iowa City. Coll. of Pharmacy.
R. V. Smith, and M. J. Garst.
Analytica Chimica Acta, Vol 65, No 1, p 69-75, June 1973. 1 fig, 2 tab, 18 ref.

Descriptors: *Aqueous solutions, *Chemical analysis, Water analysis, Nuclear magnetic resonance, *Phenols.
Identifiers: *p-Cresol, Thin layer chromatography, Atomic absorption spectrophotometry, Ultraviolet spectroscopy, Sample preparation, *Sodium cobaltinitrite.

The reaction of p-cresol with acidified cobaltinitrite has been qualitatively and quantitatively studied. On an analytical scale, the reaction predominantly leads to 2-nitro-p-cresol. The dimer of this compound has also been identified as a minor product. Two methods have been devised for quantitative analysis. The one involves measurement at 366 nm of the 2-nitro-p-cresol formed, after extraction into chloroform. The other employs treatment with sodium hydroxide which causes conversion of 2-nitro-p-cresol to its anion which is measured at 433 nm. The first method is superior in precision and is more rapidly performed. The second provides greater sensitivity and potential selectivity. Both are useful for analyzing p-cresol and may be applicable to other p-substituted phenols. (Little-Battelle)

TRITIUM PRODUCTION.

In: Tritium, p 30-85, May 1973. 25 fig, 9 tab, 66 ref. Messenger Graphics, Pub., Phoenix, Ariz., and Las Vegas, Nev., Price: $35.00.

Descriptors: *Tritium, *Industrial production, *Nuclear powerplants, Radioactivity, *Radioactivity effects, Fallout, Effluents, Nuclear explosions, Nuclear reactors, Nuclear engineering, Safety, Air pollution, Water pollution, Water pollution sources, Soil contamination, Water vapor, Absorption, Population, Environmental effects, Food chains, Absorption, Public health.
Identifiers: *Nuclear detonation, *Thermonuclear fusion, *Fission, Plowshare.

Tritium is formed in both thermonuclear fusion and nuclear fission. Because of its intermediate half-life and biological importance, tritium poses a very special hazard to the world population. The basic mechanisms for generation of tritium in operation of nuclear reactors are reviewed. Long-term buildup of tritium and its management are discussed. Investigations are reported of prediction and measurement of tritium production in reactors. Detonation of nuclear explosives produces substantial amounts of tritium from two sources: the explosive itself and the material and rock surrounding the explosive. The tritium production by a nuclear weapon is closely related to its specific design and to the environment in which it is detonated. The effects of nuclear weapons tests on the tritium inventory can be summarized as follows: (1) The contribution from fission weapons is negligible. (2) The contribution from thermonuclear tests conducted in the atmosphere is large. The present inventory is approximately 45 times the natural background. (3) Underground testing of thermonuclear weapons has not contributed significantly to the atmospheric burden. (Houser-ORNL)
W74-00009

DETECTION AND MEASUREMENT.

In: Tritium, p 86-191, May 1973. 63 fig, 19 tab, 176 ref. Messenger Graphics, Pub., Phoenix, Ariz., and Las Vegas, Nev., Price $35.00.

Descriptors: *Tritium, *Measurement, *Assay, *Monitoring, Air pollution, Water pollution, Soil contamination, Water pollution sources, Fallout, Nuclear explosions, Nuclear powerplants, Regulation, Administrative agencies, Public health.
Identifiers: *Thermonuclear reactors, *Thermonuclear explosions, Fuel reprocessing, Fusion, Plowshare.

The present inventory of tritium is approximately 45 times the natural background and poses a major environmental concern. It has, therefore, established a very strong motivation among scientists to do research for establishment of methods for calibration of tritium standards, its detection and measurement. Various methods are reported for analysis, counting, measuring, and monitoring of tritium. The method of analysis/measurement used depends upon the objective and thus requires a choice of the most suitable of several techniques, using criteria such as the degree of accuracy required, response time, cost of analysis, sample quantities available, etc. Some of the methods are gas counting, enrichment and analysis of low-level tritium samples, monitoring devices, liquid scintillation systems, practical limits of determination, continuous monitoring of aqueous tritium activity, application of emulsions in tritium counting with refrigerated systems, and new procedures for liquid scintillation counting. (Houser-ORNL)
W74-00010

KINETICS OF TRITIUM IN BIOLOGICAL SYSTEMS.

In: Tritium, p 289-381, May 1973. 34 fig, 24 tab, 218 ref. Messenger Graphics, Pub., Phoenix, Ariz., and Las Vegas, Nev., Price: $35.00.

Descriptors: *Tritium, *Kinetics, *Transfer, *Biological communities, Equilibrium, *Radioisotopes, *Radioactivity effects, Air pollution, Water pollution, Soil contamination, Food chains, Public health, Water pollution sources, Nuclear powerplants, Distribution, Invertebrates, Bioindicators, Turnovers, Wastes, Dairy industry, Aquatic animals, Sea water, Absorption, Fish, Ecology.

Various aspects of tritium kinetics in biological systems are reported. First the kinetics and equilibrium isotope effect of tritium substation, the chemical properties of tritium in its reactions, and a conspicuous lack of data on this isotope are reported. Other items of concern are the distribution of tritium between the hydrosphere and invertebrates, biokinetics of environmental tritium, its turnover rates in mammals and desert mammals, excretion in man under tropical conditions and via cow's milk, studies on the food chain contaminated by tritium, biological implications of tritiated luminous compounds, tritiation of aquatic animals, and the behavior of fish chronically exposed to tritium. (Houser-ORNL)
W74-00011

CERTAIN ENVIRONMENTAL ASPECTS OF TRITIUM.
In: Tritium, p 382-495, May 1973. 46 fig, 19 tab, 175 ref. Messenger Graphics, Pub., Phoenix, Ariz., and Las Vegas, Nev., Price: $35.00.

Descriptors: *Tritium, Environment, *Atmosphere, *Sea water, *Soils, Air pollution, Water pollution, Soil contamination, Hazards, Water vapor, Transfer, Food chains, Public health, Radioactivity, Radioactivity effects, Radioecology, Ecosystems, Vegetation, Absorption, Behavior, Model studies, Movement, Water, Climatology.
Identifiers: *Tritiated water.

Tritium existed primarily in the atmosphere and surface waters in small but measurable quantities prior to nuclear bomb testing. However it is estimated to have increased approximately 50-fold as a result of atmospheric weapons testing. The radiological hazard from conversion of tritium to tritiated water in air by metal catalysts is reported. Concern is expressed for additional concentrations of tritium in the environment with additional releases from power reactors, fuel reprocessing plants, and accelerators along with the projected dosage. Some of the major pathways to man are via the food chain from exposures to tritiated water vapor, ingestion and inhalation. The Cumulative Exposure Index (CUEX) concept is being developed to facilitate realistic assessment of the effect of environmental releases of radionuclides. Its concept is explained. The effect of an exposure of the ecological system is described. The transfer of tritium, from methane gas resulting from underground detonation tests, to vegetation is reported. The movement of tritium in soil is being studied by tracer techniques. Water movement in soils under various climatological conditions is being studied through a dynamic model. (Houser-ORNL)
W74-00012

ENVIRONMENTAL MONITORING TECHNIQUES.

In: Tritium, p 496-556, May 1973. 36 fig, 12 tab, 54 ref. Messenger Graphics, Pub., Phoenix, Ariz., and Las Vegas, Nev., Price: $35.00.

Descriptors: *Monitoring, *Tritium, *Measurement, *Assay, *Regulation, Safety factors, Air pollution, Water pollution, Water pollution sources, Effluents, Environment, Aquatic environment, Analytical techniques, Instrumentation, Methane, Natural gas, Krypton, Radioisotopes.

Monitoring for tritium may be done for two reasons. The first is to measure releases to maintain acceptable levels, and the second serves as a check against possible mechanical failures. Various ways of monitoring for tritium are discussed. These methods are concerned with measuring tritium in water and air effluents, laboratory systems for tritium analysis of large numbers of environmental samples, and monitoring of tritium in the aquatic environment. Analytical quality control of analyses of tritium in water may be achieved through intercomparison studies. A sampler for nonaqueous tritium gases is described. Also described is a tritium stack monitor having a wide digital range. An on-line monitor for natural gas from nuclear stimulation provides a fast and accurate method for measuring tritium and krypton-85 in natural gas. (Houser-ORNL)

CAPACITIES OF SHALLOW WATERS OF SAGAMI BAY FOR OXIDATION AND REDUCTION OF INORGANIC NITROGEN,
Tokyo Univ. (Japan). Ocean Research Inst.
T. Miyazaki, E. Wada, and A. Hattori.
Deep-Sea Research and Oceanographic Abstracts, Vol 20, No 6, p 571-577, June 1973. 4 fig, 3 tab, 18 ref.

Descriptors: *Nitrogen, Shallow water, *Sea water, *Radioactivity techniques, *Oxidation, *Reduction (Chemical), *Path of pollutants, Inorganic compounds, Nitrites, Nitrates, Ammonia, Absorption, Chemical analysis, Water analysis, Tracers, Methodology, Water sampling, Mass spectrometry, Pollutant identification.
Identifiers: *Japan (Sagami Bay), N-15, Coastal waters, Fate of pollutants, Chemical recovery, Kjeldahl procedure.

The distribution of nitrite, nitrate and ammonia in Sagami Bay, Japan, was investigated on Cruises KT-70-5 and KT-70-13 of the R.V. Tansei Maru. The purpose was to estimate the capacity of coastal waters for the oxidation and reduction of inorganic nitrogen by measuring the incorporation of N-15 into nitrite from N-15-labeled ammonia and nitrate. N-15-labeled ammonia, nitrite or nitrate was added at 10 microgram-atoms N/l concentrations to water samples in glass bottles some of which were incubated in the sunlight or in the dark. N assimilation was measured on filtered residues by Kjeldahl digestion. N-15 incorporation into nitrite was determined using azo dyes along with Kjeldahl digestion and N-15 content by mass spectrometry. Chemical analyses for nitrate, nitrite and ammonia were carried out by previously described methods. In summer, the maximum concentration of nitrite (about 0.3-microgram atoms N/l in central Sagami Bay) occurred at 20-30 m depth and was associated with a seasonal thermocline. In winter, the concentrations of nitrite were nearly constant (about 0.3-microgram atoms N/l) from the surface down to about 100 m; below that depth they decreased. The potential activities for nitrite production from nitrate ammonia were measured, using a N-15-tracer method. The activity for nitrite production from nitrate was of the same order of magnitude as that from ammonia (1.4 ng atoms N/l./hour, on an average), irrespective of the season. The capacities for assimilation of inorganic nitrogen in the upper layers (0-50 m) were several times higher than those for the oxidation of ammonia and the reduction of nitrate, but a reverse relation was observed below the euphotic zone. The residence time of nitrite in the upper layers was 7-16 days. (Holoman-Battelle)

THE ENVIRONMENTAL FATE OF STRANDED CRUDE OIL,
Woods Hole Oceanographic Institution, Mass.
M. Blumer, M. Ehrhart, and J. H. Jones.
Deep-Sea Research and Oceanographic Abstracts, Vol 20, No 3, p 239-259, March 1973. 5 fig, 6 tab, 11 ref.

Descriptors: *Environmental effects, *Weathering, *Oil spills, Persistence, Aging (Physical), Chemical analysis, Gas chromatography, Microbial degradation, Chemical degradation, Oil pollution, Fossil fuels, *Massachusetts, Water pollution.
Identifiers: *Fate of pollutants, *Crude oil, n-Paraffins, n-Alkanes, Liquid chromatography, Infrared spectrophotometry, Infrared spectra, Petroleum residues, Boiling point, Bermuda, *Martha's Vineyard (Mass), Wax, Marine environment.

The weathering history of two light paraffinic crude oils which stranded on Martha's Vineyard, Massachusetts, and on Bermuda has been studied over periods of 13 1/2 and 16 months, respectively. The evaporative history of the oils, the microbial utilization of the normal alkanes and other physical and chemical changes involved in the weathering process are described. Oil samples collected from each site were analyzed on temperature-programmed gas chromatographs with 3 percent Apiezon L on Chromosorb W columns. Other analyses included infrared spectrophotometry, liquid chromatography, and ultraviolet analysis. At both locations a considerable and environmentally important fraction of the oil has persisted throughout the entire survey period. The residues are far from being inert asphalts; they remain crude oils, modified by evaporation of the lower boiling components and by partial microbial degradation. The environmental impact of spilled oil depends directly on the magnitude of the standing crop of fossil fuels and on the retention during weathering of specific biologically active oil components. This work demonstrates an unanticipated degree of persistence of oil and of its high boiling components, even under conditions thought favorable to weathering. Wax aggregates in one of the oils suggest that it was derived from tank washings. A survey for wax in open ocean 'tar' should give insight into its sources and the effectiveness of measures to control oil pollution. (Holoman-Battelle)

PHOTODECOMPOSITION OF THE HERBICIDE METHAZOLE,
Kentucky Univ., Lexington. Dept. of Entomology.
G. W. Ivie, W. Dorough, and R. A. Cardona.
Journal of Agricultural and Food Chemistry, Vol 21, No 3, p 386-391, May/June 1973. 3 fig, 2 tab, 6 ref.

Descriptors: *Herbicides, *Pollutant identification, *Pesticide toxicity, *Water analysis, Chlorinated hydrocarbon pesticides, Ultraviolet radiation, Solar radiation, Water, Radioactivity techniques, Chemical analysis, Degradation (Decomposition), Urea pesticides, Mass spectrometry, Methodology, Isolation, Phytotoxicity, Water pollution.
Identifiers: *Photodecomposition, *Methazole, *Metabolites, Degradation products, Photoisomers, Sample preparation, Photodegradation, 3 4-Dichloronitrobenzene, Methanol, Proton magnetic resonance, 1- (3 4-Dichlorophenyl)-3-methylurea, 1- (3 4-Dichlorophenyl)urea, Infrared spectrophotometry, Dichloro-1-methyl-2-benzimidazolinone, PMR spectra, Infrared spectra, 1- (3 4-Dichlorophenyl)-3-methoxymethylurea, 2- (3 4-Dichlorophenyl)-4-methyl-1 2 4-oxadiazolidine-3 5-dione, Mass spectra.

Exposure of methazole (2- (3,4-dichlorophenyl)-4-methyl-1,2,4-oxadiazolidine-3-5-dione) to ultraviolet light in methanol or to sunlight in water or as surface deposits resulted in loss of carbon dioxide from the oxadiazolidine ring with subsequent generation of several derivatives. Photoproducts identified include 3,4-dichloronitrobenzene, 1-(3,4-dichlorophenyl)-3-methylurea, 1- (3,4-dichlorophenyl)urea, and two isomeric dichloro-1-methyl-2-benzimidazolinones. The methylurea and urea compounds were not produced in methanol, but 1- (3,4-dichlorophenyl)-3-methoxymethylurea was generated in rather large quantities. This compound degraded to the urea during workup of the photolysis mixture. The two isomeric dichloro-1-methyl-2-benzimidazolinone photoproducts were not phytotoxic to bean or tomato foliage, but were more toxic to mice than methazole when administered ip. (Holoman-Battelle)

INORGANIC AND ORGANIC PHOSPHORUS DISTRIBUTION IN DOMESTIC AND MUNICIPAL SEWAGE,
Saskatchewan Univ., Saskatoon. Dept. of Soil Science.
P. M. Huang, and C. P. Hwang.
Water and Sewage Works, Vol 120, No 6, p 82-83, June 1973. 1 tab, 7 ref.

Descriptors: *Phosphorus, *Domestic wastes, *Municipal wastes, *Distribution, *Pollutant identification, Sewage, Suspended solids, Dissolved solids, Filtration, Nutrient removal, Distillation, Nutrients, Separation techniques, Methodology.
Identifiers: *Organic phosphorus, Colloidal solids, Membrane filters, Cellulose membranes.

A domestic sewage sample and a municipal sewage sample were examined to determine the distribution of inorganic phosphorus in different size fractions of sewage. Fractionation was carried out by cellulose membrane filtration. Before fractionation, total P, inorganic and organic P content was determined in the less than 3-micron suspension and in the less than 0.025-micron suspension. The amount of total, inorganic and organic phosphorus in sewage decreases with successive filtrations through different size millipore membranes. The percent distribution of total phosphorus in the greater than 3-micron solids, 0.025-3-micron solids and less than 0.025-micron suspension of the samples ranges from 29-40, 5-7 and 53-66, respectively. These separations roughly correspond to suspended solids, colloidal solids and dissolved solids. The percent distribution of inorganic phosphorus in the respective fractions ranged from 19-29, 0-8 and 63-81; that of organic phosphorus ranged from 56-72, 7-17 and 21-27 percent. Inorganic phosphorus was relatively concentrated in the less than 0.025-micron suspension, but it was also present in considerable amount in the greater than 3-micron solids. In contrast to inorganic phosphorus, the content of organic phosphorus in the greater than 3-micron solids was two to more than three times higher than that in the less than 0.025-micron suspension. The total organic phosphorus removed by the filtration with 3-micron and 0.025-micron membranes ranged from 73-79 percent. (Holoman-Battelle)

EFFECTS OF PH, LIGHT AND TEMPERATURE ON CARBARYL IN AQUEOUS MEDIA,
Oregon State Univ., Corvallis. Environmental Health Sciences Center.
R. D. Wauchope, and R. Haque.

Bulletin of Environmental Contamination and Toxicology, Vol 9, No 5, p 257-260, May 1973. 1 tab, 11 ref.

Descriptors: *Degradation (Decomposition), *Aqueous solutions, Hydrogen ion concentration, Mass spectrometry, Hydrolysis, Solar radiation, *Carbamate pesticides, Volumetric analysis, Chromatography, Sea water, Solubility.
Identifiers: *Carbaryl, Thin layer chromatography, Fate of pollutants, Photooxidation, 1-Naphthol, 2-Hydroxy-1 4-naphthoquinone, Lawsone, *Photodegradation.

Degradation of carbaryl in aqueous media was observed under several conditions. The rate of consumption of base was observed using a Radiometer syringe titrator in the pH-stat mode. A 95 percent solution of recrystallized carbaryl was added to distilled water with a pH of 9.0-10.0 for the experiments. Reaction times and second-order rate constants were obtained. Hydrolyses were run in a dark amber glass bottle immersed in water and with temperature and pH closely controlled. A xenon-arc lamp was used to simulate solar radiation of basic solutions of carbaryl in the cavity of a spectrometer. Products were analyzed by mass spectroscopy and thin-layer chromatography. The results show that there is little difference in carbaryl hydrolysis rate constants in NaOH solution vs. seawater. Solubilities of carbaryl were 114 ppm at 24C and 67 ppm at 12C based upon titration rates. In weakly acid solutions, carbaryl and 1-naphthol were stable for weeks in the dark and under laboratory light. Base hydrolysis of carbaryl in the dark leads to formation of 1-naphthol as the only naphthyl product. However, basic 1-naphthol or hydrolyzed carbaryl-solutions turn yellow then amber under laboratory light. Thus, it is the basic form of 1-naphthol, 1-naphthoxide ion, which appears to be especially light sensitive, and photodegradation of this species is probably the most important route for further changes. Products identified in irradiated samples were 1-naphthol and 2-hydroxy-1,4-naphthoquinone (lawsone). (Little-Battelle)

NOXIOUS SUBSTANCES CONTAINED IN THE WATERS: THEIR ORIGIN, BEARING, AND THEIR ELIMINATION, (IN GERMAN),
Mainz Univ. (West Germany). Hygiene Institut.
J. Borneff.
Zentralbl Bakteriol Parasitenkd Infektionskr Hyg Erste Abt Orig Reihe B Hyg Praev Med. Vol 155, No 3, p 220-230, 1971. English summary.
Identifiers: *Germany, Human wastes, Nitrates, *Noxious substances, Reviews, Sewage, Water pollution control, Path of pollutants, Water purification.

Past efforts to control water pollution in Germany are reviewed. Communities and industry are mainly responsible for the major part of water pollution. Both currently discharge insufficiently or non-purified sewage into lakes and rivers. Immediate measures for ground-water protection (marking of protection zones, prevention of accumulation of nitrates) must be taken to ensure perfect quality of drinking water prepared from surface water (general introduction of proved conditioning methods, supplementation of analytic control examinations for trace substances) and for protection of allround hygienic quality of the surface water (erection of clarification plants). The prevalence and effects of the various noxious substances must be studied to determine specific preventive directions and regulations. Noxious substances known to be particularly hazardous must be replaced by other compounds.--Copyright 1973, Biological Abstracts, Inc.

INTERACTION OF YELLOW ORGANIC ACIDS WITH CALCIUM CARBONATE IN FRESHWATER,
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
A. Otsuki, and R. G. Wetzel.
Limnology and Oceanography, Vol 18, No 3, p 490-493, May 1973. 2 fig, 1 tab, 18 ref.

Descriptors: *Calcium carbonate, Freshwater, *Organic matter, *Separation techniques, *Chemical precipitation, Humic acids, Organic acids, Adsorption, Chemical reactions, Pollutants, Hydrogen ion concentration, Hardness (Water), Methodology, Chemical analysis, Water analysis.
Identifiers: *Yellow humic acids, Chemical recovery, Sample preparation.

That refractory dissolved organic matter can be removed naturally from lake waters as CaCO3 precipitates has been examined. Adsorption experiments involving yellow humic acids were done by inducing CaCO3 precipitation from homogenous systems. Carbon-14 yellow acids were prepared from the experimental decomposition of a C-14-labeled aquatic plant (Scirpus subterminalis). Experimental water was collected from the mouth of an inlet stream which dominates the total monthly Ca ion input to Lawrence Lake throughout the year. More than 30 percent of yellow acids were removed from solution along with CaCO3 precipitation. The pH of each solution increased with time from the initial 8.4 to 9.0-9.1, suggesting that CaCO3 precipitation occurred with the release of CO2 from Ca (HCO3)2 rather than as the result of supersaturation of CaCO3. The results show that large amounts of soluble humic substances are removed from lake water with CaCO3. It was found that the yellow acids behave like lipid material with respect to association with CaCO3 particles. (Holoman-Battelle)

ORGANOCHLORINE INSECTICIDE RESIDUES IN STREAMS DRAINING AGRICULTURAL, URBAN-AGRICULTURAL, AND RESORT AREAS OF ONTARIO, CANADA - 1971,
Department of Agriculture, London (Ontario). Research Inst.
J. R. W. Miles, and C. R. Harris.
Pesticides Monitoring Journal, Vol 6, No 4, p 363-368, March 1973. 2 fig, 3 tab, 6 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Drainage water, *Pollutant identification, *Pesticide residues, Insecticides, Chemical analysis, Bottom sediments, Urban runoff, Agricultural runoff, Recreation wastes, Drainage area, Pollutants, Water analysis, DDT, DDD, DDE, Dieldrin, Endrin, Heptachlor, Aldrin, Insecticides, Gas chromatography, Solvent extractions, Brown trout, Rainbow trout, Rock bass, Carp, Bass, Lake trout, Cisco.
Identifiers: Electron capture gas chromatography, Trace levels, Chemical recovery, Sample preparation, Biological magnification, Animal tissues, Bioaccumulation, TDE, Endosulfan, gamma-Chlordane, Lindane, Heptachlor epoxide, Muskoka River, Muskoka Lakes, Thames River, Gas liquid chromatography, Animal tissues, Bluegills, Salmo trutta, Salmo gairdneri, Ambloplites rupestris, Cyprinus carpio, White sucker, Catostomus commersoni, Salvelinus namaycush, Aroclor 1254, Chemical interference, Coregonus artedii, *Canada (Muskoka River).

Organochlorine insecticide residues in water systems draining agricultural, urban-agricultural, and resort areas of Ontario, Canada, were compared by analysis of water, bottom mud, and fish, collected during the period from mid-April to mid-October 1971. Insecticides detected by electron capture gas chromatography were p,p'-DDT, o,p-DDT, p,p'-TDE, o,p'-TDE, p,p'-DDE, gamma-chloradane, dieldrin, endrin, endosulfan, heptachlor, heptachlor epoxide, lindane, and aldrin. Insecticide concentrations in water from all three areas were less than the 'Maximum Reasonable Stream Allowances' for growing fish that are safe for human consumption. The concentrations of total DDT in the water were combined with water flow data to calculate the weekly rate of transport of total DDT at each sampling time. The greatest transport of total DDT was by the Muskoka River which drains the Muskoka Lakes resort area where DDT was used until 1966 for control of biting flies; a peak of 11.8 lb total DDT per week was recorded in May, but this transport quickly lessened, resulting in a May to October average of 1.9 lb total DDT per week. Corresponding figures for the Thames River (urban-agricultural) were peak 2.5 lb and average 0.4 lb total DDT per week and for Big Creek (agricultural), peak 0.5 lb and average 0.2 lb per week. The ratio of concentration of total DDT in mud to total DDT in water was as great as 800; total DDT in fish to total DDT in water was as great as 1 million. The ratio of p,p'-TDE to p,p'-DDT was less than 1 in water but greater than 1 in bottom mud, indicating possible dechlorination of p,p'-DDT to p,p'-TDE in the bottom mud. Polychlorinated biphenyls (PCB's) were present in the urban-agricultural area samples of bottom mud and fish at levels up to 217 ppm and about 0.4 ppm, respectively. (Holoman-Battelle)

RATE OF EVAPORATION OF LOW-SOLUBILITY CONTAMINANTS FROM WATER BODIES TO ATMOSPHERE,
Toronto Univ. (Ontario). Dept. of Chemical Engineering and Applied Chemistry.
D. Mackay, and A. W. Wolkoff.
Environmental Science and Technology, Vol 7, No 7, p 611-614, July 1973. 1 tab, 17 ref.

Descriptors: *Evaporation, Rates, *Pollutants, Bodies of water, *Mathematical studies, *Forecasting, *Aqueous solutions, Solubility, Equations, Mercury, Aquatic environment, Methodology, Diffusion, Pesticides, Polychlorinated biphenyls, Vapor pressure, Heavy metals, DDT, Dieldrin, Aldrin, Aromatic compounds, Organic compounds, Water pollution, Air pollution, *Path of pollutants.
Identifiers: *Hydrocarbons, *Chlorinated hydrocarbons, Desportion, Aroclor 1242, Aroclor 1248, Aroclor 1254, Aroclor 1260, Lindane, Alkanes, n-Octane, 2 2 4-Trimethylpentane, Aromatic hydrocarbons, Aliphatic hydrocarbons, Benzene, Toluene, o-Xylene, Cumene, Naphthalene, Fate of pollutants.

Equations are derived to predict the rate of evaporation from aqueous solutions of compounds such as hydrocarbons and chlorinated hydrocarbons which are of low solubility. The rate of evaporation can be high even for compounds of low vapor pressure and 'half lives' in solution can

be as low as minutes or hours under laboratory or environmental conditions. The rate may be limited by diffusion or desorption. Transfer of contaminants from the water to air environments may thus occur much faster than has been generally appreciated. (Holoman-Battelle)

BASELINE CONCENTRATIONS OF LIGHT HYDROCARBONS IN GULF OF MEXICO,
Texas A and M Univ., College Station. Dept. of Oceanography.
J. M. Brooks, A. D. Fredericks, W. M. Sackett, and J. W. Swinnerton.
Environmental Science and Technology, Vol 7, No 7, p 639-642, July 1973. 5 fig, 2 ref.

Descriptors: Surface waters, *Gulf of Mexico, *Baseline studies, *Sea water, Water analysis, Water quality, *Pollutant identification, Organic compounds, Gases, Methane, Chemical analysis, *Gas chromatography, Water pollution sources.
Identifiers: *Hydrocarbons, Marine environment, Flame ionization gas chromatography.

A 2500-mile survey of light hydrocarbon concentrations in surface water of the Gulf of Mexico was conducted to determine baseline concentrations for a program to identify problems related to oceanic environmental quality. Analyses of the light hydrocarbons were carried out by flame ionization gas chromatography. High concentrations seem to be associated solely with man's activities in the vicinity of ports and offshore petroleum drilling and production operations and in one case on the high seas, near a tanker reportedly discharging 'clean ballast water'. GROUND-WATER NITRATE POLLUTION IN RURAL AREAS,
Illinois State Water Survey, Urbana.
W. H. Walker.
Ground Water, Vol 11, No 5, p 19-22, September-October 1973. 2 fig, 3 ref.

Descriptors: *Path of pollutants, *Nitrates, *Groundwater, Farm wastes, Fertilizers, Waste disposal, Groundwater movement.

In humid regions, chemical pollutants such as nitrate readily enter surficial aquifers as slugs during recharge periods in the nongrowing season and move slowly through the aquifer to nearby drainage tiles, streams, or pumping wells. Little mixing with native groundwater seems to occur, and for this reason, fairly small quantities of pollution may enter a well as a high-concentration slug long after its initial entry into the aquifer. Nitrate slug concentrations in excess of 6,000 ppm have been delineated in one surficial aquifer in Illinois. Trees and plants may temporarily store large quantities of nutrients during the growing season for release to aquifers during subsequent nongrowing seasons. Considering this, it appears imperative that farm fertilizer application and waste disposal on farmlands be limited to the growing season and only in quantities that will not ultimately cause groundwater nitrate concentrations to rise above toxic levels. OCCURRENCE AND DISTRIBUTION OF HELMINTH PARASITES OF FISHES FROM LAKE CARL BLACKWELL, OKLAHOMA,
Oklahoma State Univ., Stillwater.
R. D. Spall.
Available from the National Technical Information Service as COM-72-11082, $3.00 in paper copy, $1.45 in microfiche. M.S. thesis supported by National Marine Fisheries Service, Report NOAA-72070613, July 1968. 108 p, 6 fig, 20 tab, 179 ref. 4-24-R.

Descriptors: *Fish parasites, *Hosts, *Worms, Fish, Fish diets, Systematics, Distribution, Nematodes, Trematodes, *Oklahoma.
Identifiers: *Helminths, Lake Carl Blackwell (Okla), South Central U.S.

The endoparasitic helminths of fishes in Lake Carl Blackwell, Oklahoma, were surveyed, and to what degree certain environmental factors can be correlated with variations in the prevalence and intensity of parasitism determined. Channel catfish (Ictaluras punctatus) and white crappie (Pomoxis annularis), because of constant availability, were selected for analysis together with other fish species collected during summer. The incidence and intensity of fish infection with helminth parasites varied considerably among different hosts. Certain habitat features such as high turbidity and absence of aquatic macrophytes probably limited many Trematoda. Host age appears to have far-reaching effects on parasitism in natural infections. Physiological and immunological changes resulting from the aging process appeared to influence their helminthocenoses. The most obvious changes are those associated with gonadal development and sexual maturity. Data seem to show that ontogenic changes in the feeding behavior of the host are perhaps even more important. Seasonal variation in incidence and severity of helminth parasitism, especially those utilizing fish as definitive hosts, was probably influenced by the annual life cycle of the parasite. Changing food habits of the host has been cited to explain observable differences in its helminth fauna. (Jones-Wisconsin)

HYGIENIC EFFICACY OF SANITARY PROTECTION MEASURES FOR SURFACE WATERS IN THE REGION OF OIL-REFINING AND OIL-CHEMICAL ENTERPRISES, (IN RUSSIAN),
Nauchno-Issledovatelskii Institut Gigieny i Profzabolevanii, Ufa (USSR).
F. G. Murzakaev.
Gig Sanit. Vol 37, No 7, p 15-18. 1972. (English summary).
Identifiers: *Chemical wastes, Hygienic protection, *Oil wastes, *Sanitary protections, Surface waters, Industrial wastes, *USSR (Belaya River).

A complex of sanitation measures (technologic, sanitary-technical, organizational, etc.) was carried out by oil-refining and oil-chemical enterprises of a large industrial center for the sanitary protection of surface waters. Consequently, down current of the river Belaya, a significant fall in contamination was noted at the water uptake sites for the municipal water supply. Further sanitation measures should stipulate a more intense decontamination of sewage containing oil and organic substances by local and biological treatment installations. In such cases after biological decontamination, the effluents should undergo a number of additional treatments to diminish the concentration of residual organic and cancerogenic compounds.--Copyright 1973, Biological Abstracts, Inc.

NITRATE CONTENT OF WELL WATER IN WEST-CENTRAL WISCONSIN,
Wisconsin Univ., River Falls.
M. W. Wehking, J. W. Pavlik, P. Strege, and D. Gilles.
Wisconsin Academy of Sciences, Arts and Letters, Vol 61, p 259-265, 1973. 1 fig, 4 tab, 11 ref.

Descriptors: *Potable water, *Water pollution sources, *Nitrates, *Wells, *Wisconsin, Depth, Limestones, Groundwater, Spectrophotometry, Fertilizers, Coliforms, Water analysis.
Identifiers: Pierce County (Wis.), St. Croix County (Wis.).

Concern over nitrate content of drinking water, particularly from groundwater sources, prompted survey of wells in Pierce and St. Croix Counties, Wisconsin. Nitrate content of 124 wells was determined. None of the well water samples contained iron sufficient to affect analysis. Nitrate content of these wells varied widely, the majority containing concentrations of less than 20 ppm. Twenty of the wells (16.5%) yielded water containing nitrate in excess of 45 ppm. The data acquired from those wells for which depths were known were examined for relationship between well depth and nitrate content. Although the correlation was not perfect, the summarized data indicate that as well depth increased, the average nitrate content decreased. In areas underlain by limestone, faults in the subterranean structure allow surface water to reach depths of several hundred feet quite rapidly. No conclusions were reached from the results as to origin of nitrate in ground water. However, greater probability exists of finding excessive quantities of nitrate beyond 45 ppm. in shallow wells less than 150 ft than in deep wells greater than 150 ft. (Jones-Wisconsin)

ISOMERIZATION OF GAMMA-BHC TO ALPHA-BHC IN THE ENVIRONMENT,
Wisconsin Univ., Madison. Dept. of Entomology.
H. J. Benezet, and F. Matsumura.
Nature, Vol 243, No 5408, p 480-481, June 22, 1973. 1 fig, 10 ref.

Descriptors: *Microbial degradation, *Sediments, *Metabolism, Cultures, Gas chromatography, Separation techniques, Soil bacteria.

Identifiers: *Benzene haxachloride, *Isomerization, Pseudomonas putida, Lindane, Fate of pollutants, Isomers, Alpha-benzene hexachloride, Gamma-benzene hexachloride, Degradation products, Metabolites, Gamma-pentachlorocyclohex-l-ene, Gamma-tetrachlorocyclohex-l-ene.

To study the metabolic fate of gamma-BHC in the environment, a highly purified form of the compound was incubated with aquatic sediments under simulated natural conditions and with a soil microorganism under laboratory conditions. For the first test, the gamma-BHC was added to sediments from Pearl Harbor, placed in a medicine bottle which was then filled with seawater and sunk to the bottom at the collection site for 30 d. At the end of the period, the sediment was extracted and the extract analyzed by GC. Alpha-BHC was present in quantities 4 times that found in the original quantity of gamma-BHC. Total recovery of the gamma isomer from the sediment was 40 percent. For the laboratory study, a strain of Pseudomonas putida in a mannitol base medium was incubated with gamma-BHC and NAD for 4 weeks. Concurrently small-scale experiments were conducted with C-14-labelled BHC and P. putida with and without NAD. In the culture tests with NAD, 40 times as much alpha-BHC was present as originally. With the C-14-labelled BHC, P. putida was found to produce gamma-PCCH (gamma-pentachlorocyclohex-l-ene) from gamma-BHC, but was capable of producing alpha-BHC with NAD present. Another metabolic product of alpha-BHC production was gamma-BTC (gamma-tetrachlorocyclohex-l-ene). It is concluded that microorganisms in the environment may isomerize gamma-BHC to alpha-BHC. ASSOCIATION OF HYDROCARBONS AND MINERAL PARTICLES IN SALINE SOLUTION,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
P. A. Myers, and J. G. Quinn.
Nature, Vol 244, No 5410, p 23-24, July 6, 1973. 3 tab, 11 ref.

Descriptors: *Sediments, *Adsorption, *Clays, Illite, Montmorillonite, Bentonite, Oil spills, Path of pollutants, Toxicity, Water pollution effects, Organic matter, Solubility, Sea water, *Rhode Island, *Organic compounds.
Identifiers: *Fuel oil, Eicosane, Hexadecane, Anthracene, Phenanthrene, Fate of pollutants, Heat of sorption, n-Alkanes, Branched alkanes, Isoprenoid hydrocarbons, Aromatic hydrocarbons, Naphthalenic hydrocarbons, *Narragansett Bay (R.I.).

Bentonite clay or marine sediments from Narragansett Bay were added to saline solutions containing hydrocarbons (eicosane, Hexadecane, anthracene, phenanthrene, or fuel oil) dissolved in acetone to study the sorption of hydrocarbons on the minerals. The marine sediments were tested with and without organic matter separated. The heats of sorption of eicosane and anthracene onto bentonite clay indicated physical absorption to be of the van der Waals type. The results of the sorption tests show that hydrocarbon solubility affects uptake and retention of fuel oil by marine sediments and that organic matter in sediments reduces the incorporation of fuel oil into the sediment samples investigated. Although the compounds are firmly associated onto the mineral particles, they may be slowly released by biological activity and dissolution. If dissolution were dominant, the more polar hydrocarbons, which are toxic, would be released more readily and could impose a continuing stress on marine organisms long after visual evidence of oil production has disappeared. DEGRADATION OF PARATHION IN FLOODED ACID SOILS,
Central Rice Research Inst., Cuttack (India).
N. Sethunathan.
Journal of Agricultural and Food Chemistry, Vol 21, No 4, p 602-604, July/August 1973. 1 fig, 4 tab, 9 ref.

Descriptors: *Insecticides, *Phosphothioate pesticides, *Acidic soils, *Chemical degradation, *Pesticide residues, *Microbial degradation, Soil bacteria, Hydrolysis, Soil analysis, Laterites, Saline soils, Alluvium, Biodegradation, Degradation (Decomposition), Organophosphorus pesticides, Solvent extractions, Methodology, Isolation, Chemical analysis, Soil contamination.
Identifiers: *Parathion, Flooded conditions, Degradation products, p-Nitrophenol, Chemical recovery, Metabolites, Bacillus, Sample preparation, Thin layer chromatography.

The persistence of parathion (0,0-diethyl 0- (p-nitrophenyl) phosphorothioate) in five acid soils under flooded conditions was investigated. Parathion residues were prepared for analysis by thin-layer chromatography by extraction with 1:1 chloroform-diethyl ether, evaporation to dryness and dissolution in methanol. To determine if the degradation in acid sulfate soil were biological or chemical, parathion dissolved in ethanol was added to autoclaved and nonautoclaved soils which were in turn flooded with sterile distilled water. The standing water of alluvial soil which exhibited hydrolytic activity after 3 additions of parathion was analyzed for biological or chemical hydrolysis. The insecticide degraded faster in soils which had a higher organic matter content. Fastest degradation occurred in an acid sulfate soil with an organic matter content of 12.2 percent, apparently due to microbial participation. Repeated additions of parathion to an alluvial soil enhanced its hydrolysis to p-nitrophenol. Heat treatment of the parathion-hydrolyzing enriched culture from the alluvial soil retarded its activity, indicating the role of biological agents in the hydrolysis. A Bacillus sp capable of readily decomposing p-nitrophenol as a sole carbon source was isolated from parathion-amended flooded alluvial soil. (Holoman-Battelle)

BIODEGRADABILITY OF NONIONIC SURFACTANTS: SCREENING TEST FOR PREDICTING RATE AND ULTIMATE BIODEGRADATION,
Procter and Gamble Co., Cincinnati, Ohio. Environmental Water Quality Research Dept.
R. N. Sturm.
Journal of the American Oil Chemists' Society, Vol 50, No 5, p 159-167, May 1973. 12 fig, 29 ref, 1 append.

Descriptors: *Surfactants, Carbon dioxide, Methodology, *Microbial degradation, Chemical reactions, Laboratory equipment, *Biodegradation, *Detergents.
Identifiers: *Nonionic detergents.

A method based on conversion to CO2 and H2O has been developed for determining biodegradability characteristics of non-ionic surfactants. The screening test consists of the Thompson-Duthie CO2 test scaled down from 20 to 6 liters, and a biochemical oxygen demand test performed with acclimated sewage-derived microorganisms. The CO2 test apparatus is arranged in such a manner that eight materials and a positive control may be tested simultaneously. Nine individual acclimation cultures-each combining settled raw sewage as a source of microorganisms, yeast extract as an easily assimilatible nutrient source, BOD water as a diluent and source of inorganic nutrients, and a test material for 14 days. At the end of that time, equal aliquots from each of these cultures are used to make a composite seed for use in the CO2 test. The final composition in each carboy includes 600 ml of composite seed and 120 mg of a test material brought to a total of 6 liters with BOD water. During the test CO2-free air is bubbled through the test units and the effluent gas is passed through a series of CO2 absorbers containing barium hydroxide. Periodically, the proximal absorber is removed for titration. The test is continued for a period of 26 days. At day 25, the test vessels are acidulated to pH 3.0 in order to release CO2 that may be trapped in the medium. A wide range of nonionic surfactants have been screened for biodegradability by this method, and the results, in general, correlate well with those of other investigators. These have included studies of the effect of hydrophobe chain length, ethoxylate chain length, and the presence of phenolic groups on biodegradability. The method should lend itself to measuring degradation under conditions of anaerobiosis or low temperature. (Little-Battelle)

DISPERSION AND TRANSPORT OF RHODAMINE B DYE AND METHOXYCHLOR IN RUNNING WATER: A PRELIMINARY STUDY,
Queen's Univ., Kingston (Ontario). Dept. of Biology.
R. R. Wallace, W. F. Merritt, and A. S. West.
Environmental Pollution, Vol 5, No 1, p 11-18, July 1973. 2 fig, 24 ref.

Descriptors: (*Pesticide kinetics, *Dye dispersion), *Monitoring, *Path of pollutants, Running waters, Chlorinated hydrocarbon pesticides, Fluorescent dye, Pesticide residues, Water analysis, Pollutant identification, Insecticides, Rhodamine, Fluorometry, Chemical analysis, Pollutants.
Identifiers: *Rhodamine B, *Methoxychlor, Chemical indicators, Organic dyes, Gas liquid chromatography, Tetraethyl di-amino-o-carboxy-phenyl-xanthenyl chloride, 1 1 1-Trichloro-2 2-bis (p-methoxyphenyl)enthane.

A study was carried out to ascertain if the fluorescent dye Rhodamine B (tetraethyl di-amino-o-carboxy-phenyl-xanthenyl chloride) could be used as an indicator for the insecticide methoxychlor (1,1,1-trichloro-2,2-bis (p-methoxyphenyl)ethane) which, when used as an emulsifiable concentrate against blackfly larvae, disperses readily in running water. Two streams north of Baie Comeau, Quebec, were used with the chemicals being administered to fast water riffles in both streams. Concurrent insecticide-Rhodamine B treatment and experiments with Rhodamine B alone were carried out. A submersible sampling pump was placed mid-channel near the bottom of the stream to ensure a constant flow of about 12 l/min to the fluorometer. Readings were recorded at minute intervals and the insecticide residue content in water samples was determined by fluorometry and gas-liquid chromatography. The arrival times for the peak concentration of dye were quite different in the 2 streams at roughly equivalent distances downstream. However, the results have shown that the dye can provide useful information for planning future larvicide treatments and can form a basis for monitoring insecticide concentrations downstream from ground-level application sites, or for predicting effects in other streams of similar character in advance of actual or potential loadings. PHOTOLYSIS OF THE HERBICIDE DINITRAMINE (N3,N3-DIETHYL-2,4-DINITRO-6-TRIFLUOROMETHYL-M-PHENYLENEDIAMINE),
United States Borax Research Corp., Anaheim, Calif.
H. C. Newsom, and W. G. Woods.
Journal of Agricultural and Food Chemistry, Vol 21, No 4, p 598-601, July/August 1973. 2 fig, 1 tab, 10 ref.

Descriptors: *Herbicides, Halogenated pesticides, Solar radiation, Aqueous solutions, Water analysis, Pollutant identification, Methodology, Degradation (Decomposition), Chemical analysis, Gas chromatography, Mass spectrometry, Nuclear magnetic resonance.
Identifiers: *Degradation products, *Dinitramine, *Photodegradation, *Degradation rates, *Photolysis, Methanol, Fate of pollutants, Photodecomposition, Metabolites.

The degradation rate and products of the photolysis of the herbicide dinitramine (N3,N3-diethyl-2,4-dinitro-6-trifluoromethyl-m-phenylenediamine) in methanol and in water were investigated. Of concern also were sunlight degradation of aqueous dinitramine, the sunlight irradiation of dinitramine in natural waters and on sand, photolysis of C-14-labeled dinitramine in water, and the photolysis of 5-amino-1,2-dihydroxy-3-ethyl-2-ethyl-4-nitro-6-trifluoromethylbenzimidazoline. The compound was found to degrade rapidly through reductive cyclization of a nitro group and an adjacent N-ethyl group to give the following products: 6-amino-1-ethyl-2-methyl-7-nitro-5-trifluoromethylbenzimidazole; 5-amino-1,2-dihydroxy-3-ethyl-2-methyl-4-nitro-6-trifluoromethylbenzimidazoline; 1-ethyl-6-hydroxylamino-2-methyl-7-nitro-5-trifluoromethylbenzimidazole; and 6-amino-2-methyl-7-nitro-5-trifluoromethylbenzimidazole. PROTEIN ADSORPTION BY SUSPENDED SEDIMENTS: EFFECTS OF PH, TEMPERATURE, AND CONCENTRATION,
Alaska Univ., College. Inst. of Water Resources.
A. P. Murray.
Environmental Pollution, Vol 4, No 4, p 301-312, June 1973. 6 fig, 2 tab, 9 ref. OWRR A-030-ALAS (3).

Descriptors: *Proteins, *Adsorption, Aquatic environment, *Suspended solids, *Sediments, *Environmental effects, Water temperature, Hydrogen ion concentration, Variability, Soil analysis, Water analysis, Bottom sediments, Bottom sampling, Water sampling, Chemical analysis, Aquatic soils, Colorimetry, *Alaska, Kaolinite, Illite, Montmorillonite, Particle size, Clay minerals, Path of pollutants.
Identifiers: Natural waters, Chemical concentration, Characterization, Fate of pollutants, Sample preparation, Tanana River, Lowe River, Knik Arm, Bovine serum albumin.

The affinities of sediment materials from various natural, silt-laden waters in Alaska, and their variation with pH, temperature and protein concentration, were determined for the protein bovine serum albumin. Water and bottom soil samples were collected from Alaskan river systems in summer and autumn. The water samples were characterized in terms of the particle size distributions of their suspended matter and the soil samples were characterized before their use in adsorption experiments. The sediment sample or reference sample for the adsorption experiments was placed in an Erlenmeyer flask to which was added a temperature-equilibrated solution of the protein in distilled water or buffer solution. The flask was capped, contents mixed, set in an incubator-shaker and shaken at 200 rpm on a rotary motion shaker at a known temperature for at least 24 h. To determine the amount of protein remaining in solution at equilibrium, an aliquot of the suspension was centrifuged and the supernatant was analyzed for protein by the Folin-Ciocalteu colorimetric method. As expected, the pH of the water system plays an important role in the amount of the protein bovine serum albumin adsorbed by suspended sediments. For the soil materials studied, maximum adsorption was observed at pH 3; minimum at pH 6.5. The behavior of the Alaskan sediments in this respect was similar to that of kaolinite and montmorillonite but unlike that of illite. From experiments in which the adsorptive capacities of the sediments were measured as a function of the initial amount of protein, it was found that the equilibrium concentration of protein remaining in solution could be related to the initial protein:sediment ratio by the equation: c equals k times the quanititiy P sub o divided by m raised to the n power. Variations in temperature from 5C to 25C had no detectable effect on the amount of protein adsorbed. The amount of protein adsorbed (at the pH of the natural water systems) on to suspended sediments would have a negligible effect on the rate at which the protein would be decomposed in the aqueous environment. (Holoman-Battelle)

TOXIC MATERIALS ANALYSIS OF STREET SURFACE CONTAMINANTS,
URS Research Co., San Mateo, Calif.
R. E. Pitt, and A. Gary.
Copy available from GPO Sup Doc as EP1.23/2:73-283, $1.55; microfiche from NTIS as PB-224 677, $1.45. Environmental Protection Agency, Technology Series Report EPA-R2-73-283, August 1973. 143 p, 10 fig, 67 tab, 61 ref. EPA Project 11034 FUJ.

Descriptors: *Storm runoff, *Surface runoff, *Urban runoff, Pollution (Water), Solids, *Heavy metals, Biochemical oxygen demand, Chemical oxygen demand.
Identifiers: Street cleaning, *Street-surface contaminants.

Because of the large amounts of toxic materials (especially heavy metals) found associated with street surface particulates during the course of a previous study (Water Pollution Aspects of Street Surface Contaminants), additional work has recently been completed which defines the distribution and range of heavy metals on the Nation's city streets. This project defined the breakdown of the particulates' compositions by having mass spectographic analyses performed on various samples. Using these results, the heavy metals which were determined to have the greatest water pollution potential (As, Cd, Cr, Cu, Fe, Pb, Mn, Hg, Ni, Sr, Ti, Zn, and Zr) were analyzed in each of about 75 samples collected nationwide in 10 cities in the previous study. DISPERSION-AFFECTED TRANSPORT OF REACTING SOLUTES IN SATURATED POROUS MEDIA: GALERKIN METHOD APPLIED TO EQUILIBRIUM-CONTROLLED EXCHANGE IN UNIDIRECTIONAL STEADY WATER FLOW,
Geological Survey, Menlo Park, Calif.
J. Rubin, and R. V. James.
Water Resources Research, Vol 9, No 5, p 1332-1356, October 1973. 7 fig, 22 ref.

Descriptors: *Dispersion, *Ion exchange, *Ion transport, *Groundwater movement, Path of pollutants, Water chemistry, Mass transfer, Solutes, Chemical reactions, Saturated flow, Translocation, Leaching, Mathematical studies, Numerical analysis.
Identifiers: *Galerkin method.

Equations describing dispersion and ion exchange in one-dimensional transport of solutes in saturated porous media may be solved numerically by means of the Galerkin method. It is assumed that water flow is steady and that local chemical equilibrium exits throughout the systems considered. No constancy restrictions are placed on the total concentration of the dissolved ions participating in exchange. The cases treated involve (1) homogeneous or layered systems, (2) exchange reactions with constant or concentrations dependent selectivity coefficients, (3) binary or multicomponent exchange, and (4) systems in which one of the exchanging ions is also involved in a precipitation-dissolution reaction. The approach may be useful in analyzing a variety of solute transport processes of hydrologic interest. (Knapp-USGS)

S. P. Gupta, and R. A. Greenkorn.
Water Resources Research, Vol 9, No 5, p 1357-1368, October 1973. 4 fig, 1 tab, 27 ref.

Descriptors: *Path of pollutants, *Dispersion, *Groundwater movement, Numerical analysis, *Adsorption, Porous media, Farm wastes, Industrial wastes, Fertilizers, Pesticides, Herbicides, Water pollution sources.

Major sources of pollution in underground water come from the runoff of cattle feedlots, from runoff of fertilizers, pesticides, and herbicides from cultivated lands, and from domestic and industrial wastes. The equations for the dispersion and adsorption of various chemicals in porous media are formulated to calculate pollution movement. If a bilinear rate of adsorption is assumed, two coupled nonlinear parabolic partial differential equations result. The equations can be solved by the Crank-Nicolson method, which is a stable, two-step method. Solutions for the range of variables involved in the movement of pollutants in porous media are obtained for a one-dimensional model. (Knapp-USGS)

PICLORAM MOVEMENT FROM A CHAPARRAL WATERSHED,
Forest Service (USDA), Tucson, Ariz. Rocky Mountain Forest and Range Experiment Station.
C. A. Davis, and P. A. Ingebo.
Water Resources Research, Vol 9, No 5, p 1304-1313, October 1973. 3 fig, 2 tab, 30 ref.

Descriptors: *Path of pollutants, *Herbicides, *Runoff, Pesticide residues, Water pollution sources, Pesticide drift, Translocation, Water yield improvement, *Arizona, Chaparral, Watershed (Basins).
Identifiers: *Picloram.

After a brush control treatment of soil-applied pellets of picloram (9.3 lb acid equivalent per acre) on a 2.1-acre side slope of a 46-acre chaparral watershed in central Arizona, picloram was detected in the stream water at a gaging station at the outlet of the watershed. Maximum measured concentrations (250-370 ppb) occurred during the first 3 months after treatment and were associated with heavy rainfall. After 14 months and 40 inches of accumulated rainfall, picloram was no longer detected in the stream water. An estimated 4.5% of the picloram applied was lost to stream water. Direct use of stream water from the outlet of the treated watershed when picloram levels were 46-370 ppb could have damaged sensitive crops such as cotton. (Knapp-USGS)

EFFECT OF AGRICULTURAL MANAGEMENT OF WET SLOPING SOIL ON NITRATE AND PHOSPHORUS IN SURFACE AND SUBSURFACE WATER,
Agricultural Research Service, Burlington, Vt. New England Watershed Research Center.
G. R. Benoit.
Water Resources Research, Vol 9, No 5, p 1296-1303, October 1973. 3 fig, 3 tab, 13 ref.

Descriptors: *Nitrates, *Phosphates, *Path of pollutants, *Water pollution sources, *Fertilizers, Farm wastes, Runoff, Groundwater, Leaching, Infiltration, Drainage water, Subsurface drainage, Drainage practices.

Differences in nitrate and phosphate content of water from three cropping systems were evaluated in a 12-plot study in East Franklin, Vermont, on a poorly drained, sloping Cabot silt loam: (1) timothy, red clover, Kentucky bluegrass hay-pasture; (3) corn silage. Six plots were in alfalfa hay, six plots were planted in corn, and the upslope area was in hay-pasture. Soil samples were collected in the summers of 1969 and 1970 and analyzed for total soil nitrogen. Surface and subsurface drain effluent samples from the plots and upslope area were analyzed for nitrates and phosphates. Draining wet sloping land may decrease total soil nitrogen; nitrate nitrogen may be lost from organic matter breakdown in cold but unfrozen soil; nitrates but not phosphates will move both vertically and laterally through the soil to subsurface drains; surface runoff ontains few nitrates but significant concentrations of phosphates; and more nitrates were lost from fertilized corn plots than from alfalfa plots or hay-pasture areas. (Knapp-USGS)

ANNUAL CYCLE IN RIVER WATER QUALITY: A TIME SERIES APPROACH,
King's Coll., London (England). Rogate Field Center.
A. M. C. Edwards, and J. B. Thornes.
Water Resources Research, Vol 9, No 5, p 1286-1295, October 1973. 6 fig, 5 tab, 17 ref.

Descriptors: *Time series analysis, *Water quality, *Streamflow, *Path of pollutants, Frequency analysis, Statistics, Statistical methods, Variability, Regression analysis, Fourier analysis, Correlation analysis.
Identifiers: *River Stour (England).

Regression, spectral, and cross-spectral techniques were used to examine the trends and periodicity in a 20-year record of weekly observations of eight water quality variables in the River Stour, eastern England. Linear regression shows that all except pH and carbonate hardness have significantly increased over time. A strong annual cycle is present. Cross-spectral analysis was used to model the relationship between the variables and the water discharge in time. Nitrate and non-carbonate hardness are positively correlated with discharge, whereas carbonate hardness is an inverse function. (Knapp-USGS)

CESIUM 137 IN A MOUNTAIN STREAM CHANNEL,
Colorado State Univ., Fort Collins. Dept. of Watershed Sciences.
J. E. Hubbard, and W. D. Striffler.
Water Resources Research, Vol 9, No 5, p 1440-1442, October 1973. 1 tab, 6 ref.

Descriptors: *Radioisotopes, *Fallout, *Cesium, *Alluvium, Sediments, *Colorado, Path of pollutants, Snowpacks, Snowmelt.

Concentration of the radionuclide Cs-137 in water, sediment, and channel vegetation was determined in a Colorado mountain watershed in 1967. No measurable Cs-137 was found in stream water. Specific Cs-137 activity in sediment decreased exponentially with distance from the headwaters. Its concentration was 124 pc/g at the headwaters, where a snowfield has existed continuously since the atmospheric testing of nuclear weapons, to 4 pc/g 5600 meters downstream. Stream vegetation samples also indicated a similar decrease in specific Cs-137 activity with site location downstream. (Knapp-USGS)

EFFECT OF INSOLUBLE GRAINS ON LEACHATE FROM POROUS BEDS,
Syracuse Univ., N. Y. Dept. of Civil Engineering.
W-H., Li, and F. H. Feng.
Water Resources Research, Vol 9, No 5, p 1462-1464, October 1973. 3 fig, 2 ref.

Descriptors: *Leaching, *Porous media, *Path of pollutants, Solubility, Hydraulic models, Waste disposal, Industrial wastes.

Some industrial wastes are composed of soluble and insoluble grains. When such waste is deposited as a waste bed, the soluble material may become a continuous source of pollutant to water. Under certain conditions it is advisable to leach out the soluble material at a controlled rate. As the soluble material is being leached out, the voids and the ratio of the soluble parts to the insoluble parts of the bed change slowly with time. In the leaching of a porous bed composed of soluble and insoluble grains the concentration of dissolved material in the leachate is influenced by the presence of the insoluble material. This influence was studied by modeling the bed as a laminar tube with a wall composed of consecutive soluble and insoluble rings. The presence of the insoluble wall surfaces has a negligible effect on the leachate if they are less than 50% of the total wall surface. (Knapp-USGS)

MOVEMENT OF POLLUTANT PHOSPHORUS IN SATURATED SOILS,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
P. Goodrich.
PH D Thesis, 1970. 135 p, 57 fig, 3 tab, 49 ref.

Descriptors: *Path of pollutants, *Phosphates, Soil contamination, *Saturated soils, Isotherms, Sands Diffusion, *Adsorption, Clay, *Soil columns, Radioisotopes, Denitrification, Waste water (Pollution), Electromagnetic waves, Instrumentation, Effluents, *Irrigation, Water pollution, *Waste disposal, Nutrients, Farm wastes, *Monitoring.
Identifiers: Radioactive tracer solutions, Scintillator, Automatic data collection, Sandy loam, Land disposal, Influent.

A laboratory experiment was carried out using uniform soil columns and radioactive tracer solutions to monitor movement of phosphorus inside soil columns. An electronic data acquisition

system was developed to monitor long term study. Results were compared with adsorption models already developed. Simulated high-phosphate irrigation showed the limited capabilities of surface soil in preventing ground water pollution. Sand and sandy loam soils were tested. Results emphasized the importance of clay minerals in phosphate adsorption. However, soils have a finite capacity for adsorbing phosphate, and continuous flushing as in irrigation may cause the phosphate to move quickly to great depths, thus affecting ground water. Therefore, the design of dispoal fields must be considered in order to prevent over-accumulation of phosphorus in soil columns. (Frantz-East Central)

BIOLOGICAL ASPECTS OF AGRICULTURE'S EFFECTS ON ENVIRONMENTAL QUALITY,
Kentucky Univ., Lexington. Dept. of Entomology.
H. W. Dorough.
In: Quality of the Environment, Socio-Economic, Biological and Engineering Aspects, Papers presented at the College of Agriculture Annual Conference, University of Kentucky, January 5-7, 1971. p 8-13 (1971).

Descriptors: Agriculture, *Kentucky, Runoff, *Farm wastes, Surface waters, *Insecticides, Toxicity, Soils, Dairy industry, Erosion, Fertilizers, Livestock, Air pollution, Water pollution, *Soil contamination, Sedimentation, *Pesticide residues.
Identifiers: Tobacco industry, *Environmental quality.

Agriculture depends upon maintaining a quality environment. But, it may have various detrimental effects on that environment. The Environmental Quality Task Force in the University of Kentucky College of Agriculture was established to evaluate the following problems: pesticides, sediment, farm wastes and fertilizers. Concentrated pesticide use contaminates surface water, air and especially soil. Erosion and sedimentation aid in the transportation of pollutants in streams. The phosphorus and nitrogen from farm wastes and certain nutrients from fertilizers are major sources of water pollution. Evaluation of the general use of pesticide contamination problem in Kentucky indicates cause for concern, but the situation is not yet critical. (Frantz-East Central)
W74-00396

SOIL CONDITIONS UNDER FEEDLOTS AND ON LAND TREATED WITH LARGE AMOUNTS OF ANIMAL WASTES,
Southwestern Great Plains Research Center, Bushland, Tex.
B. A. Stewart, and A. C. Mathers.
Contribution from Soil and Water Conservation Research Divsion, Agricultural Research Service, U.S. Department of Agriculture in cooperation with the Texas Agricultural Experiment Station, Texas A and M University (1972). 3 p, 1 tab, 2 fig, 9 ref.

Descriptors: *Feed lots, *Farm wastes, *Water pollution, *Soil contamination, Cattle, *Nitrates, *Pollutants, Soil profiles, *Waste disposal, Water, Salt, Leaching.
Identifiers: Soil conditions, Croplands.

Nitrate and other pollutants often accumulate in soil profiles under large feedlots. Water movement through these profiles, however, is usually very slow or does not occur, especially in the more arid areas. A greater pollution hazard results from spreading large amounts of animal wastes on cropland for the purpose of waste disposal rather than for improving soil conditions or crop growth and quality. A recent study showed that substantial quantities of nitrate accumulated when manure was applied to land at rates of 30 tons/acre or greater. Salt accumulation was also high enough to cause some injury to plant growth. Leaching can reduce the salt concentration, but may increase nitrate pollution of the drainage water. Indications are that pollution hazards are eliminated only when the growing crop utilizes most of the applied nitrogen. When the rate of manure application is too high, nitrate will accumulate in the soil and in some crops or will move through the soil with percolating water. (East Central)

EXCRETION STUDIES IN SWINE FED ARSANILIC ACID,
Abbott Laboratories, North Chicago, Ill. Nutrition Research Dept.
L. R. Overby, and D. V. Frost.
Journal of Animal Science, Vol 19, No 1, p 140-144, January, 1960, 2 tab, 9 ref.

Descriptors: *Arsenic, *Farm wastes, *Swine, *Diets, *Feeding, Poultry.
Identifiers: *Arsanilic acid.

The rates of arsenic excretion were determined in the feces and urine of swine receiving arsanilic acid at 30, 60 and 90 gm. per ton of feed. Much more arsenic was excreted in the feces than in the urine. After 10 days of arsanilic acid feeding, total excretion was in approximate balance with intake at the two lower levels of feeding. After the arsenical was withdrawn from the ration, the charcteristic excretion level continued for two days, then decreased rapidly. This conforms with knowledge of the rate of disappearance of arsenic from tissues of animals fed arsanilic acid. The nature of the major part of the arsenical excreted was not determined. Unchanged arsanilic acid was not detected in the urine, but was present in the feces in an amount representing about 5% of the arsanilic acid consumed. (EastCentral)

NITROGEN COMPOUNDS IN NATURAL WATER--A REVIEW,
Geological Survey, Menlo Park, Calif.
J. H. Feth.
Water Resources Research, Vol 2, No 1, p 41-58, 1st Quarter, 1966. 1 fig, 9 tab, 57 ref.

Descriptors: *Reviews, *Nitrogen, Water, *Farm wastes, Groundwater, Public health, Fixation, *Nitrogen cycle, *Water pollution, Air pollution, Soil contamination, Fertilizers, Proteins, Rocks, Leaching, Precipitation, Atmosphere, Ammonia, Aerosols, Water quality, Geochemistry.

Nitrogen compounds in natural water are significant in public health, agriculture, industry, and geochemistry. The many sources of nitrogen compounds and the deep involvement of nitrogen in the life processes of organisms makes the study of such compounds difficult. The sources include natural aerosols, precipitation, fixation by microorganisms in soil and water, decaying organic matter, and animal and industrial wastes, as well as probably undiscovered sources in consolidated and unconsolidated rocks. Nitrogen compounds are both oxidized and reduced by organisms. Some nitrogen compounds are adsorbed on clay. The theoretical end product in water and the compound probably most often determined is NO2-1. The concentration of nitrogen compounds ranges from 0.0 to > 100 ppm in surface water and from 0.0 to > 1000 ppm in groundwater. Seasonal fluctuations occur. Much further research is needed, including improvements in methods of analysis, further investigation of sources, and detailed study of the nitrogen cycle in small drainage basins. (East Central)
W74-00402

OBSERVATIONS ON THE EFFECT OF PROTEIN INTAKE AND STAGE OF GESTATION ON THE PROPORTION OF URINARY NITROGEN EXCRETED AS UREA IN SHEEP,
Rowett Research Inst., Bucksburn (Scotland).
J. J. Robinson, D. Scott, and C. Fraser.
Journal of Agricultural Science, Vol 80, No 3, p 363-368, June 1973. 3 tab, 4 fig, 14 ref.

Descriptors: *Sheep, Diets, Energy.
Identifiers: *Protein intake, *Gestation, *Urinary nitrogen, *Nitrogen retention.

The effect of altering the level of protein intake on urea excretion in ewes w s assess d in two separate experiments. In Experiment 1, 14 pregnant (during th last 20 days of gestation) and 10 non-pregnant ewes were each offered a different level of digested N intake in the range 5-25 g/day. At all levels of protein intake urea N excretion was lower in pregnant than in non-pregnant ewes. In Experiment 2, 21 pregnant ewe lambs were each offered one of three diets supplying mean intakes of 83 (T 1), 113 (T 2) or 147 (T 3) g crude protein/day. During the last 100 days of gestation the mean levels of urea n excretion were 6.9, 11.0 and 15.2 g/day for T 1, T 2 and T 3, respectively. The corresponding values for urinary N excretion were 9.3, 13.8 and 18.2 g/day. At all levels of protein intake urea N excretion was lower just prior to parturition than 95 days prepartum; the difference was correlated with lamb birth weight and maternal body-weight change. A notable feature of both experiments was the low level of urea N excretion by the pregnant ewes in late gestation, at low protein intakes. It would appear that when energy intake is adequate the decrease in urea N excretion associated with pregnancy is a direct re ult of an increased N requir ment for maternal and/or foetal growth. (East Central)
W74-00408

ENRICHMENT OF THE ATMOSPHERE WITH NITROGEN COMPOUNDS VOLATILIZED FROM A LARGE DAIRY AREA,
Agricultural Research Service, Riverside, Calif.
R. E. Luebs, K. R. Davis, and A. E. Laag.
Journal of Environmental Quality, Vol 2, No 1, p 137-141, January-March 1973. 3 fig, 3 tab, 18 ref.

Descriptors: *Dairy industry, *Cattle, *Nitrogen, Ammonia, *Air pollution, Feed lots, *Water pollution, Toxicity, *Farm wastes, Sampling, Temperature, Humidity, Winds, Rainfall.
Identifiers: Distillable nitrogen, Nondistillable nitrogen, Atmospheric NH3, Enrichment.

A dairy cow population of 143,000 in an area of 150 km2 enriched the atmosphere with distillable N (mostly NH3) over an area in excess of 560 km2. Over an area of 35 km2, where cow population density was approximately 1,600 cows/km2, the concentration of distillable N in the atmosphere was between 20 to 30 times greater than at a control site outside the dairy area. Highest concentrations of N were associated with wet corral surfaces and favorable evaporative conditions. Approximately 20% of the total N absorbed by acid-surface traps in the dairy area was nondistillable N while filtered air samples contained 5% or less. Rainfall delivered three times as much N to the land surface inside than outside the dairy area. (East Central)
W74-00409

NITRATE CONTENT OF PERCOLATES FROM MANURED LYSIMETERS,
Guelph Univ. (Ontario). Dept. of Land Resource Science.
D. G. Bielby, M. H. Miller, and L. R. Webber.

Journal of Soil and Water Conservation, Vol 28, No 3, p 124-126, May-June, 1973, 4 tab, 3 ref.

Descriptors: *Nitrates, *Farm wastes, *Lysimeters, *Corn, Slurries, *Waste disposal, Groundwater, Soils, *Poultry, Irrigation, Denitrification, Ontario.
Identifiers: *Percolates, Guelph sandy loam.

The quantity and concentration of nitrates in percolates from lysimeters receiving liquid poultry manure applications were determined over a 3-year period. Nitrogen removed by corn, plus that in percolates, accounted for less than 25 percent of the amount applied to the soil. Most nitrates in the percolates were discharged from the lysimeters after corn harvest. The average concentration of nitrates in percolates from all treatments and for all years exceeded 10 parts per million. (East Central)
W74-00417

THE EFFECT OF RATION ON ENGINEERING PROPERTIES OF BEEF CATTLE MANURE,
Nebraska State Dept. of Environmental Control, Lincoln. Solid Waste Div.
G. A. Frecks, and C. B. Gilbertson.
Paper no, 73-442 presented at the 1973 Annual Meeting, American Society of Agricultural Engineers, University of Kentucky, Lexington, June 17-20, 1973. 24 p, 6 tab, 6 fig, 20 ref.

Descriptors: *Cattle, *Farm wastes, Kentucky, *Feeds, *Digestion, Volatility, Shrinkage, Porosity, Chemical properties, Physical properties, Volumetric analysis, Sieve analysis, Density, *Waste treatment, *Waste storage, Solids, Moisture content, Chemical oxygen demand, Engineering.
Identifiers: *Ration, Drying rates.

Beef cattle were fed a high concentrate ration (HCR) and a high roughage ration (HRR) for five days. Samples of feces and urine were collected and analyzed to assist in the engineering design of materials handling and processing equipment and storage facilities. The total, volatile, and fixed solids content were not affected by the ration. Of the HCR wastes, 20% was retained on a 2 mm. sieve as compared to 2% for the HRR wastes. Volume change from original moisture contents to dry solids was 55% for the HCR and 7.4% for the HRR feces. Due to its more porous structure the HRR feces dried at twice the rate of the HCR. AGRICULTURE AND ENVIRONMENT,
W. H. Garman.
Crops and Soils, Vol 25, No 9, p 14-19, Aug-Sept, 1973.

Descriptors: Photosynthesis, *Water pollution, *Nitrates, Phosphates, Soils, Eutrophication, *Livestock, Agriculture, *Farm wastes, Farm animals, *Fertilizers, Feed lots, Algae, Plankton, Nutrients, Carbon dioxide, Wells, Lakes, Balance of nature.

Questions regarding agriculture and the balance of nature are answered. The use of nitrogen fertilizers can under some circumstances be harmful to farm animals, but has never presented a human health problem. Farming and nitrate fertilizers seldom, except under extreme circumstances, contribute to nitrate levels in streams, lakes, and water wells. Fertilizers seldom cause excessive algae growth. Long term experiments show that fertilizer use has not damaged soils. (Frantz-East Central)

BACTERIAL FLAGELLAR UNCOORDINATION AS A MONITOR FOR INDUSTRIAL POLLUTANTS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
N. R. Krieg.
Completion Report, WRRC Project No. 2003240 1973. 10 p, 1 fig, 2 tab.

Descriptors: *Bioindicators, *Monitoring, Bacteria, Industrial wastes, Pollutant identification, Toxins, *Path of pollutants, Ions, Zinc, Nickel, Copper, Mercury, Lead.
Identifiers: *Spirillum volutans, *Flagellar uncoordination.

A rapid, simple, and relatively inexpensive standardized method has been developed for the in-plant biological monitoring of levels of toxicants in industrial effluent using flagellar uncoordination in Spirillum volutans as the indicator response. Zinc, nickel, copper, mercury, and lead ions could be detected at concentrations of 2 or 3 ppm; cetyl pyridinium chloride at 1 ppm; aniline at 30 ppm; and other compounds in a similar concentration range. Combinations of metals were detected when each was present at a level lower than its minimum effective concentration when used alone. The response, which is visible immediately by darkfield microscopy at 125X, is a marked and obvious change in the motility of the organism. Normal cells reverse frequently because the polar fascicles of flagella reorient, forming 'head' and 'tail' cones of rotation which propel the cell through the medium. Various compounds cause the flagella to become uncoordinated, forming two 'head' or two 'tail' fascicles on the same cell, which is then unable to seim because of opposing propulsion. The method was developed for use in testing samples of effluent for uncoordinating concentrations of toxic agents before discharge into a receiving stream.
W74-00438

SULPHUR POLLUTION PATTERNS OBSERVED: LEACHING OF CALCIUM IN FOREST SOIL DETERMINED,
Norske Skogforsoksvesen, Oslo.
L. N. Overrein.
Ambio. Vol 1, No 4, p 145-147. 1972. Illus.
Identifiers: *Calcium, Forest soils, Iron, *Leaching, Magnesium, *Norway, Pollution sources, Potassium, Precipitation, Sodium, Soils, *Sulfur.

Two aspects of S pollution are presented. The deposition pattern around a Norwegian industrial center was mapped and experiments were conducted to determine the effect of varying acidity precipitation on the Ca levels of forest soils. To chart the deposition pattern, pollution gradients were obtained from snow samples taken around Heroya, an industrial center in southern Norway. The measurements indicated that rural districts, 15-40 km outside the main source of pollution, received the greatest amounts of excess acid in precipitation. The largest deposits of Ca, Mg, Fe, Mn, K, Na and sulfate were confined to the urban district near the source of pollution. The leaching of Ca in different soil types increases drastically when the acidity of the precipitation is increased. The acidity of the soil was determined primarily by 4 factors: the concentration of excess acid in precipitation; the amount of acid water penetrating the soil profile; the susceptibility to leaching of the nutrient elements available; and, the buffer capacity of the soil. The gradual acidification of the soil is accompanied by increasing acidity in the groundwater. An increasingly acid precipitation represents an environmental stress in areas where the soil is susceptible to excess acid and leaching and there might be serious consequences for the various ecosystems established in those areas.--Copyright 1973, Biological Abstracts, Inc.

DYNAMICS OF TRACE ELEMENTS IN LIMAN--MEADOW SOILS OF THE ARID ZONE OF CENTRAL KAZAKHSTAN, (IN RUSSIAN),
Akademiya Naik Kazakhskoi SSR, Alma-Ata. Institut Pochvovedeniya.
V. A. Zhukova, and E. A. Solodnikova.
Izv Akad Nauk Kaz SSR Ser Biol. 1. p 6-11. 1972.
Identifiers: Arid zones, Boron, Cobalt, Copper, Irrigation, Manganese, Molybdenum, *Soils (Liman-meadow), *Trace elements, *USSR (Kazakhstan), Zinc.

Cu, Zn, Mn, Co, Mo and B were studied at various depths in soil of Central Kazakhstan (USSR). Irrigation was the main factor in formation of hydromorphic soils. These soils are formed under leaching and oozing water regimes. The upper layers during some seasons of the year contain highly active forms of Cu, B, average and low forms of Co, low and very low forms of Zn and Mo. The mechanical composition of the soil is an important factor in the quantity of active Mn. Provision of Mn in clayey soils is high, in loamy soils Mn varies from low (in spring-summer) to high (late summer, early fall) levels. With depth, the content of active forms of Cu, Mn and Co decrease, while Zn, B and Mo increase in liman-meadow soils.--Copyright 1973, Biological Abstracts, Inc.

POLLUTION ENDANGERED UNDERGROUND WATERS IN THE NEIGHBOURHOOD OF A SEWAGE CATCHPIT DESIGNED ON THE MORAINE HIGHLAND OF NORTHERN POLAND,
Academy of Mining and Metallurgy, Krakow (Poland). Inst. of Hydrogeology and Engineering Geology.
A. S. Kleczkowski, J. Myszka, and J. Stobierski.
Bull Acad Pol Sci Ser Sci Terre. Vol 20, No 1, p 61-64. 1972.
Identifiers: Moraine highlands, *Poland, Pollution, *Sewage catchpit, Underground waters, Clay, Sands.

The sewage catchpit is located on permeable quaternary sands. Its bottom lies almost directly above the water table; it might even cut through it. The downflow of ground waters and impurities will run toward the river flowing at a distance of 500 m. The thin water-bearing horizon above the moraine is thus directly endangered. There is no natural protection of the moraine horizon (up to 20 m thickness). The efficient intermoraine horizon, protected by a continuous boulder clay layer of more than 2 m, is secure.--Copyright 1973, Biological Abstracts, Inc.

TIDAL CHARACTERISTICS OF TWO ESTUARIES IN FLORIDA,
W. B. Stelzenmuller.
Journal of the Waterways and Harbors Division, American Society of Civil Engineers, Vol 91, No WW3, Proceedings Paper 4431, p 25-36, August 1965. 10 fig, 2 ref.

Descriptors: *Estuaries, *Tidal effects, Water pollution, Sea level, Wind tides, Winds, Hurricanes, Storms, *Tidal streams, *Saline water intrusion, Runoff, Salt marshes, *Florida, Path of pollutants, *Gulf coastal plain.
Identifiers: Estuarine processes, *Estuarine pollution, Waccasassa River (Fla), Fenholloway River (Fla).

A study of tidal characteristics of the Waccasassa River and the Fenholloway River estuaries in the Gulf of Mexico (Florida) are reported. Results of a 2-year study are presented. Information is given on the influence of wind on tides and annual variations of sea level. Both estuaries have an exponential increase of cross-section with downstream distance and are in the category of partly-mixed estuaries. The influence of hurricanes is included. The two estuaries under study are physically similar in size, pattern of tidal action, low and marshy coastal segments with many interconnecting channels to adjacent creeks, rocky bottoms, and the extremely shallow coastal shelf into which they both empty. These similarities make the study of a virtually pristine tidal stream and a grossly polluted one especially worthwhile. The differences are principally the relatively steeper slope of the Fenholloway, which tends to reduce the diffusing action of salt water intrusion into the estuary, and the embayment of the Waccasassa, which is not duplicated at the Fenholloway. Wind effects on tidal heights and tidal mixing are especially important in the shallow waters of this section of the coast. The annual pattern of variation of sea level is also to be considered in evaluating the behavior of the estuaries in ridding themselves of pollution. Higher sea levels tend to coincide with higher run-off seasons and lower sea levels with lower run-off seasons along this coast. (Sinha-OEIS)

UNDERGROUND MOVEMENT OF WASTES CLARIFIED.

Chemical and Engineering News, p 15, October 15, 1973.

Descriptors: *Water pollution sources, *Groundwater movement, *Nuclear wastes, *Nuclear reactors, *Idaho, Path of pollutants, Tracers, Tritium, Model studies, Data collections, Correlation analysis, Mathematical models, Chlorides, Analytical techniques, Hydrolgeology, Water analysis.
Identifiers: *National Reactor Testing Station (Idaho).

Studies of the movement of radioactive materials and common inorganic chemicals at the National Reactor Testing Station in Idaho have led to development of a mathematical model which aids understanding of the Snake River Plain aquifer both hydrologically and chemically. Moreover, modeling techniques based on the results of these studies might be used in other large-scale problems of waste and water-resources management. Since 1952, just after the first reactor started up, an average of 200 million gallons a year of low-level radioactive wastes have gone to ponds. About 70% of the various activation and fission products are short-lived and of little significance. Of the others, only tritium has entered the Snake River Plain aquifer in detectable amounts. Tritium makes a very good tracer because it is unaffected by ion exchange or other interfering reactions. The mathematical model of waste transport developed by USGS at NRTS involves two main phases--hydrology and solute transport. The model-simulated chloride distributions match well with historical observations. The tritium distribution also is excellent. Forecasts for the various plumes show gradual growth and more dilution. (Woodard-USGS)

SUMMARY OF CHEMICAL AND RADIOCHEMICAL MONITORING OF WATER FOR THE CANNIKIN EVENT, AMCHITKA ISLAND, ALASKA, FISCAL YEAR 1972,
Geological Survey, Lakewood, Colo.
L. J. Schroder, and W. C. Ballance.
Available from NTIS, Springfield, Va. 22151 USGS-474-167 Price $4.00 printed copy; $1.45 microfiche. Contract Report USGS-474-167, 1973. 39 p, 5 fig, 6 tab, 8 ref. AEC Contract AT (49-16)-3002.

Descriptors: *Nuclear explosion, *Underground, *Alaska, *Water analysis, *Pollutant identification, Chemical analysis, Tritium, Nuclear meters, Radioactivity, Dissolved solids, Sampling, Correlation analysis, Data collections, Radiochemical analysis.
Identifiers: *Amchitka Island (Alaska), Cannikin event, Gross beta/gamma activity.

Amchitka Island, Alaska, was the site for three underground nuclear detonations. The Long Shot event was conducted on October 29, 1965, the Milrow event on October 2, 1969, and the Cannikin event on November 6, 1971. This report is concerned with the Cannikin event. An increased dissolved-solids content was found immediately after the Cannikin event at most of 10 locations in a water-sampling network established in 1967 and revised in September 1971. The observed dissolved-solids content increase was within the seasonal range that has been observed at these locations. No measureable increase in radioactivity was detected as a result of the Cannikin event at the 72 locations monitored during fiscal year 1972. A measurable increase in gross beta/gamma activity was found in January 1972 which was correlated to a surface test of a nuclear device by a foreign nation. (Woodard-USGS)

LAND RECLAMATION AND RIVER POLLUTION PROBLEMS IN THE CROAL VALLEY CAUSED BY WASTE FROM CHROMATE MANUFACTURE,
Liverpool Univ. (England). Dept. of Botany.
V. G. Breeze.
Journal of Applied Ecology, Vol 10, No 2, p 513-525, August 1973. 1 fig, 8 tab, 20 ref.

Descriptors: *Toxicity, *Chromium, *Industrial wastes, Surface runoff, *Aquatic plants, *Land reclamation, *Leaching, Heavy metals, Water pollution effects, Algae, Plants, Chromates, Soils, Chrysophyta.
Identifiers: Gomphonema parvulum, Navicula cryptocephala, Navicula viridula, Navicula radiosa, Navicula cincta, Navicula rhynchocephala, Achnanthes minutissima, Elodea canadensis, *United Kingdom (Croal River).

Wastes resulting from chromate manufacture have had toxic effects on the disposal area, and runoff from the waste have had severe effects on river flora. Toxicity studies were conducted with plants grown on the waste overlayed with soil. Composition of soluble portions of the waste was determined by progressively dissolving the material in increasing amounts of acid. An indication of the composition could be obtained from the elements which appeared in solution. Toxicity was also studied with seeds placed in Petri dishes containing solutions of chromic sulfate or potassium dichromate dissolved in water and with soil samples treated with the chemicals. The waste was toxic to plants even when diluted seven times with soil. Layers of soil over the waste are only successful if deep, due to upward diffusion of highly toxic chromate ions. Chromic ions in soil are much less toxic as chromic hydroxide and organic complexes are formed (and not because chromate is more toxic as has previously been reported). This suggests that reclamation could be achieved by chemically reducing the chromate in the waste. The waste causes serious river pollution due to leaching of chromate, but successful reclamation would lessen this. Chemical reduction of the chromate entering the river could also be beneficial as chromic ions are more rapidly lost from solution in river water. (Little-Battelle)

EFFECTS OF ARTIFICIAL AERATION ON THE CHEMISTRY AND ALGAE OF TWO MICHIGAN LAKES,
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
A. W. Fast, B. Moss, and R. G. Wetzel.
Water Resources Research, Vol 9, No 3, p 624-647, June 1973. 1 fig, 28 ref.

Descriptors: *Primary productivity, Water chemistry, *Aquatic algae, *Environmental effects, Water properties, Mixing, Nutrients, Phytoplankton, Periphyton, Water analysis, Thermal stratification, Destratification, *Aeration, Water sampling, Dissolved oxygen, Carbon dioxide, Alkalinity, Conductivity, Calcium, Magnesium, Potassium, Sodium, Phosphorus, Nitrogen, Mercury, Chemical analysis, Aquatic soils, Hypolimnion, Standing crops, Alkali metals, Alkaline earth metals, *Michigan, Chemical properties, Physical properties, Epilimnion, Lake sediments.
Identifiers: Artificial aeration, *Section Four Lake (Mich), *Hemlock Lake (Mich), Organic carbon, Particulate organic carbon, Dissolved organic carbon, Total organic carbon.

In order to determine the effect of artificial aeration in lakes, an unproductive hard water lake (Section Four Lake) and an eutrophic lake (Hemlock Lake) were artifically aerated using compressed air. Section Four Lake was completely mixed whereas Hemlock Lake had its hypolimnion aerated but thermal stratification maintained. Water samples were collected with a PVC Van Dorn sampler and determinations were made for dissolved oxygen, carbon dioxide, pH, total alkalinity, conductivity, total dissolved organic carbon, total particulate organic carbon, Ca, Mg, K, and Na. Total carbon content of the sediment was also measured. Foam samples were analyzed for total P, N, and Hg. Primary productivity estimates were made, and phytoplankton and periphyton samples were analyzed. Chemical and algal changes in Section Four Lake during destratification were not great. Although phytoplanktonic production potentials increased during mixing, the phytoplankton standing crop appeared to decline slightly, possibly due to the increased mixing depth and turbidity. Hemlock Lake hypolimnetic anoxia and conditions associated with it were eliminated during aeration. The lake gradually destratified during aeration due to leaks in the aeration tower. These leaks also released nutrient rich water into the epilimnion, which promoted algal growth. (Holoman-Battelle)

A REVIEW OF OUTBOARD MOTOR EFFECTS ON THE AQUATIC ENVIRONMENT,
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
T. P. Jackivicz, Jr., and L. N. Kuzminski.
Journal Water Pollution Control Federation, Vol 45, No 8, p 1759-1770, August 1973. 2 fig, 6 tab, 50 ref.

Descriptors: Aquatic environment, *Water pollution sources, *Water pollution effects, *Reviews, Pollutants, Boats, Organic compounds, Lead, Phenols, Water pollution, Water quality, Oil, Boating, Biochemical oxygen demand, Chemical oxygen demand, Heavy metals.
Identifiers: *Watercraft, Two-stroke outboard motors, Engine exhausts, Crackcase drainage, Exhaust emissions, Motor fuel, *Outboard motors, Operation efficiency.

Various aspects of outboard motor operation, including the magnitude of watercraft usage, operation and efficiency of a two-cycle engine, composition of outboard motor fuels, and compounds emitted during operation are reviewed. Compounds emitted to receiving waters originate from drainage of crankcase liquids and from unburned fuel passing through the combustion chamber. Over half the original fuel mixture for outboard motors may be emitted unburned into receiving waters. Factors affecting the quantity of compounds exhausted from outboard motors include horsepower rating, crankcase size, composition of fuel mixture, tuning of the engine, and speed of operation. Some of the compounds measured in water contaminated by motor exhaust include volatile and nonvolatile oil, lead and phenols. (Holoman-Battelle)

SOME CONSIDERATIONS OF THE CHEMICAL LIMNOLOGY OF MEROMICTIC LAKE MARY,
Wisconsin Univ., Madison. Water Chemistry Program.
W. C. Weimer, and G. F. Lee.
Limnology and Oceanography, Vol 18, No 3, p 414-425, May 1973. 5 fig, 4 tab, 30 ref.

Descriptors: *Meromixis, Water analysis, Water pollution effects, Trophic level, Water quality, Water sampling, Water chemistry, Water temperature, Dissolved oxygen, Turbidity, Color, Hydrogen ion concentration, Specific conductivity, Alkalinity, Sulfides, Methane, Chlorides, Sodium, Potassium, Calcium, Magnesium, Sulfates, Iron, Dissolved solids, Suspended solids, Chemical oxygen demand, Ammonia, Nitrates, Nitrites, Phosphates, Hydrogen sulfide, Nutrients, *Wisconsin, Sampling, Colorimetry.
Identifiers: *Lake Mary (Wis.), Characterization, *Chemical limnology, Chemical composition, Lake Rose, Orthophosphates, Sample preservation, Sample preparation, Atomic absorption spectrophotometry.

Meromictic Lake Mary was studied and compared with dimictic Lake Rose to evaluate the relative roles of several chemical species to determine the species of primary importance in promoting or maintaining meromixis. The approach involved detailed analyses of the dominant ionic species in the distinct layers of the lakes. Analyses included: temperature, DO, transparency, true color, pH, specific conductance, alkalinity, sulfide, methane, chloride, Na, K, Ca, Mg, sulfate, Fe, dissolved and suspended solids, COD, ammonia, nitrate, nitrite, phosphate, orthophosphate, and hydrogen sulfide. Both lakes exhibited similar seasonal variations in their chemical composition. The chemical composition of the monimolimnetic waters of Lake Mary did not vary throughout the 21-month study. Methane production in Lake Rose began soon after thermal stratification and concentrations in the anoxic hypolimnion reached about 14 mg/liter. Methane concentrations in the Lake Mary monimolimnion increased with depth and ranged up to 21 mg/liter. The concentration and vertical distribution of CH_4, together with an alkalinity increase of 22 mg/liter above that in the surface waters and an NH_4 (plus) increase of 4.2 mg/liter, indicated that biological activity helps sustain the meromixis of Lake Mary. However, the major factor allowing meromixis is the morphometry of the lake basin. (Little-Battelle)

NUTRIENT FACTORS LIMITING PRIMARY PRODUCTIVITY IN SIMULATED AND FIELD ANTARCTIC MICROECOSYSTEMS,
Virginia Commonwealth Univ., Richmond. Dept. of Biology.
G. L. Samsel, Jr., and B. C. Parker.
Va J Sci. Vol 23, No 2, p 64-71, 1972. Illus.
Identifiers: Ammonia, *Antarctic, Carbon-14, Chlorides, Ecosystems, Ecosystems, Iron, Nitrates, *Nutrients, Phosphates, *Primary productivity, Silicates.

Compared both in laboratory microecosystems and under natural field conditions, were the effects of selected nutrient enrichments on the algal communities of 2 closely associated Antarctic

lakes to discover which inorganic nutrients might most likely be responsible for the observed 'trophic' differences between them. Laboratory aquatic microecosystems simulating both lakes were established in several types of containers with living microbial communities from both lakes. Effects of enrichments with ammonia, phosphate, nitrate, silicate, Fe, and chloride singly and in combinations were examined periodically for 30-40 days, by evaluating photosynthetic 14C uptake rates by phytoplankton. Ammonia was the principal nutrient causing the differences in primary productivity. Phosphate also induced a small but significant stimulation of primary productivity, especially in combination with ammonia. Other enrichments were ineffective. Field enrichment studies, although conducted during a second season, essentially confirm laboratory results.--Copyright 1973, Biological Abstracts, Inc.

CHANGES IN FAUNA OF WATER MITES (HYDRACARINA) OF KIERSKIE LAKE, (IN POLISH),
Polish Academy of Sciences, Poznan. Inst. of Zoology.
E. Biesiadka.
Pol Pismo Entomol. Vol 42, No 2, p 263-271, 1972. English summary.
Identifiers: *Eutrophication, Fauna, Hydracarina, Lakes, *Poland (Kierskie Lake), *Water mites.

The water mite fauna of Kierskie Lake (near Poznan, Poland) is compared with the one investigated by Tutaj (1936) about 40 yr ago. There were 36 spp. and sspp. not recorded by Tutaj. The occurrence of 12 spp. of the 27 found in this lake by Tutaj was not confirmed. There were considerable differences in the abundance of particular species. These changes may be related to progressive eutrophication of the Kierskie Lake and its growing sport and tourist exploitation.--Copyright 1973, Biological Abstracts, Inc.

METHYLMERCURY AS PERCENTAGE OF TOTAL MERCURY IN FLESH AND VISCERA OF SALMON AND SEA TROUT OF VARIOUS AGES,
National Swedish Food Administration, Stockholm. Food Lab.
G. Westoo.
Science, Vol 181, No 4099, p 567-568, August 10, 1973. 1 tab, 5 ref.

Descriptors: *Gas chromatography, *Neutron activation analysis, Marine fish, Atlantic salmon, Mercury, Heavy metals, Age, *Salmon, *Pollutant identification.
Identifiers: *Methylmercury, Biological samples, *Sea trout, Tissue, Viscera, Salmo salar, Salmo ocla, Sweden.

Salmon (Salmo salar) and sea trout (S. ocla) of various ages were analyzed for total mercury by neutron activation analysis and for methylmercury by gas chromatography. The purpose was to determine whether the proportion of methylmercury was related to the age of the fish. Methylmercury in salmon 1 to 7 years old and in sea trout 1 and 2 years old averaged 93 percent and was independent of age. In both species 1 and 2 years old, methylmercury constituted 26 to 27 percent of the total visceral mercury independent of age. (Little-Battelle)

Tennessee Valley Authority, Chattanooga. Water Quality Branch.
R. Ruane, and E. G. Fruh.
Journal of American Water Works Association, Vol 65, No 5, p 358-363, May 1973. 12 fig, 4 tab, 6 ref.

Descriptors: *Analytical techniques, *Urban impact, *Water quality, *Water pollution control, Testing procedure, Evaluation, Watershed management, Urbanization, Urban drainage, Impoundments, Bacteria, Water purification, Water supply, Watersheds (Basins), Water treatment, Measurement, *Texas.
Identifiers: Austin (Tex).

Water treatment plants continuously measure a variety of water quality characteristics of the raw water they use. Thus, the plants are a 'water-quality monitor' for their sources of water. A review of the records for two water treatment plants on the Colorado River in Austin, Texas, is presented. One of the two plants has been in operation since 1924; the records for it show how construction of several impoundments upstream from Austin have affected water quality and also how water quality has deteriorated in recent years as a result of increased urbanization. The investigation also revealed the following: bacterial concentrations increased significantly in the river immediately following the construction of upstream impoundments; bacterial concentrations in the river are generally increasing, indicating the effects of increased population and urbanization; and the water quality in the plant serving the more urbanized area was less desirable than that in the other plant. (McKnight-Florida)

EFFECT OF RIVER DISCHARGE REGULATION ON THE LOWER DON PHYTOPLANKTON, (IN RUSSIAN),
Azovskii Nauchno-Issledovatelskii Institut Rybnogo Khozyaistva, Rostov-na-Donu (USSR).
E. I. Aksenova.
Gidrobiol Zh. Vol 8, No 3, p 34-38. 1972. Illus. (English summary).
Identifiers: Bacillariophyta, Chlorophyta, Chrysophyta, Cyanophyta, Discharge, Euglenophyta, *Phytoplankton, *Regulation, River, Species, *USSR (Lower Don River).

As a result of the river discharge regulation, essential changes took place in the composition and quantitative development of phytoplankton of the Lower Don (USSR). Its taxonomic composition was enriched by new species and genera of Cyanophyta, Chrysophyta, Bacillariophyta, Euglenophyta and Chlorophyta typical of the lakes and reservoirs. Quantitative changes were expressed in a sharp increase of the quantity of all groups of algae, especially Cyanophyta. An average number of algae for the vegetative period had a 17-fold increase, Cyanophyta had a 33-fold increase. A leading role in the plankton passed from Bacillariophyta and Chlorophyta to Cyanophyta.--Copyright 1973, Biological Abstracts, Inc.

NITROGEN SOURCES AND CYCLING IN NATURAL WATERS,
Florida Univ., Gainesville. Dept. of Environmental Engineering.
P. L. Brezonik.
Copy available from GPO Sup Doc as EPI.23:660-73-002, $2.35; microfiche from NTIS as PB-224 491, $1.45. Environmental Protection Agency, Ecological Research Series, EPA-660/3-73-002, July 1973. 167 p, 42 fig, 31 tab, 190 ref. EPA Project 16010 DCK.

Descriptors: *Eutrophication, Limnology, *Nutrients, *Nitrogen fixation, *Cyanophyto, Water quality, Trophic level, Algae, Bacteria, *Florida, Lakes, Phosphorus, *Lake sediments, *Nitrogen cycle, Ammonia, Organic loading, Hypolimnon.
Identifiers: Waccassa Estuary (Fla), Acetylene reduction, Anoxic hypolimnon.

Sources of nitrogen were reviewed to determine their significance in lake nitrogen budgets. Nutrients in rainfall were evaluated and found to be significant. Nitrogen and phosphorus budgets were calculated for 55 Florida lakes and critical loading rates established by comparing calculated budgets with data on trophic state. Nitrogen fixation by Cyanophyceae was studied in detail in two eutrophic Florida lakes for one year. Also a survey of fixation in Florida lakes was conducted and fixation found only in eutrophic lakes. Bacterial fixation was found to contribute significant nitrogen to the anoxic hypolimnon of a small stratified lake. Nitrogen fixation was found in both lacustrine and estuarine sediments. Sediments of 55 lakes were characterized chemically and results suggest that such sediment may act as an ammonia buffer, sorbing ammonia at high concentrations and releasing it to ammonia depleted water. Estuarine sediment absorbed ammonia strongly but failed to release it to overlying water. The acetylene reduction assay for nitrogen fixation was evaluated. Interferences in automated nutrient determinations due to organic color were studied and simple color correction found for nitrite, nitrate and orthophosphate but not ammonia as determined by the indophenol method. Amino acids also interfered with the ammonia analysis. (EPA)

Descriptors: *Minnesota, *Eutrophication, *Nutrients, Nutrient requirements, Water pollution, Sediments, Biota, Weed control, *Nutrient removal, *Algal control, Diatoms, Cyanophyta, Chlorophyta, Nitrogen, Phosphorus.
Identifiers: Pelican River (Minn), *Weed harvester, Watershed pollution, *Lake Sallie (Minn).

After more than sixty years of cultural eutrophication, Lake Sallie, Minnesota, supports dense growths of phytoplankton and rooted vegetation.

Its major water mass has the chemical character imparted by photosynthesis at all seasons, and chemical effects of decomposition are rather localized. Phytoplankton dominance alternates among diatoms, blue-green, and green algae in that order of abundance. Prior to operation of a week harvester, attached plants grew densely over 34% of the bottom area. The bulk of nitrogen and phosphorus is usually contained in the water mass, with noticeably smaller amounts in upper bottom sediments and biota. The fish population, less than one half of the mass of weeds, contained considerable more N and P than weeds in 1971. Harvest in 1970 evidently reduced weed density in 1971, and increased the cost per unit of nutrients removed. Nitrogen and phosphorus removed in weeds were insignificant when compared with annual water borne waste effluent contributions to the lake. Cost of phosphorus removal by weed harvest was $61 and $199 per pound in 1970 and 1971, respectively; nitrogen cost $8 and $21 and carbon $0.64 and $1.62 per pound for the same two years. (EPA)

RATES OF PHOTOSYNTHESIS AND PHYTOPLANKTON GROWTH IN SHAGAWA LAKE, MINNESOTA,
Minnesota Univ., Minneapolis. Limnological Research Center.
R. O. Megard.
Copy available from GPO Sup Doc as EP1.23:73-039, $0.95; microfiche from NTIS as PB-224 462, $1.45. Environmental Protection Agency, Ecological Research Series, Report EPA-R3-73-039, July 1973. 69 p, 10 fig, 13 tab, 42 ref. EPA Project 16010 DEG.

Descriptors: *Phytoplankton, *Photosynthesis, Phosphorus, Lakes, *Eutrophication, Aquatic algae, Nutrients, Water pollution effects, *Minnesota.
Identifiers: Lake pollution, *Shagawa Lake (Minn), *Aphanizomenon.

Integral photosynthetic rates and growth rates of phytoplankton were measured before, during, and after a bloom of Aphanizomenon, which occurred in August 1970. The size of the population increased during the bloom despite decreasing specific production rates, probably because the dominant algal became more buoyant and decreased its sinking rate. The effects of changing the specific production rates and specific loss rates are demonstrated by comparing the integral photosynthetic rates and chlorophyll concentrations that would prevail under steady state conditions. PARASITES, DISEASE, AND DISEASE CONTROL OF GREAT LAKES ANADROMOUS AND COMMERCIAL FISH,
Michigan Dept. of Natural Resources, Lansing.
L. N. Allison.
Available from the National Technical Information Service as COM-72-11250, $3.00 in paper copy, $1.45 in microfiche. Prepared for National Marine Fisheries Service, Completion Report NOAA-72091928, December 1971. 133 p, 3 fig, 19 tab, 35 ref. AFC-7.

Descriptors: *Fish diseases, *Fish parasites, *Pest control, *Michigan, Anadromous fish, Commercial fish, Fish hatcheries, Brook trout, Brown trout, Salmon, Fungicides, Anthelminthes (Pesticides), Rainbow trout, Perches, Bacteria, Fish diets, Parasitism, Pathogenic fungi, Chinook salmon, Antibiotics (Pesticides).
Identifiers: Redworm, Yellow grub, Gill lice, Furunculosis, Tapeworms, Whirling disease, Drugs, Alewives, Gill disease, Ortho Diquat, Hyamine 1622, Dexon, Di-n-butyl tin oxide, Tylosin Lactate, Acanthocephala, Kidney disease, White spot, Pyridylmercuric acetate.

Fish diseases, fish parasites and hatchery techniques were studied at the Grayling Research Station of the Michigan Department of Conservation. A nutrition study of six commercially made pellets was made on rainbow trout fingerlings. Several commercial trout diets were compared and determination made of those giving superior results in Michigan hatcheries. Material was compiled into a guideline for regulating and controlling importation of fish and eggs into the state. A program was started to eradicate an uncontrollable protozoan disease called 'Whirling disease' caused by Myxosoma cerebralis, and another to develop brook trout and brown trout that are resistant to furunculosis. A screening program was conducted for a drug or drugs which can be fed in the normal hatchery diet to control external parasites on trout and to work out details of the most effective dosage and daily feeding schedule. Regarding residual drugs in hatchery trout, an attempt was made to clear pyridylmercuric acetate with the Federal Food and Drug Administration for therapy of gill disease and certain external parasites of hatchery salmonids to prevent serious mortalities. Several lots of eggs from infected coho salmon were treated with Thimersol, Acriflavine, and Terramycin, respectively, to study residual bactericidal activity. (Jones-Wisconsin)
W74-00229

SOME BIOLOGICAL ASPECTS OF CHANNEL CATFISH VIRUS DISEASE,
Auburn Univ., Ala.
J. A. Plumb.
Available from the National Technical Information Service as COM-72-11301, $3.00 in paper copy, $1.45 in microfiche. Ph D Thesis supported by National Marine Fisheries Service, Report NOAA-72091907, June 1972. 130 p, 13 fig, 17 tab, 57 ref. 2-151-R.

Descriptors: *Fish diseases, *Channel catfish, *Viruses, *Epizootiology, Assay, Electron microscopy, Water temperature, Vectors (Biological), Mortality, *Arkansas.
Identifiers: Mammoth Spring Hatchery (Ark).

History, distribution and epizootiology of Channel Catfish Virus Disease are discussed. This highly virulent, communicable virus has been isolated from 23 channel catfish fingerling epizootics in nine states with 61% of the cases coming from commercial channel catfish operations. It must be assumed, until proven otherwise, that once channel catfish are exposed to the virus, they are potential virus carriers and may transmit the disease to their offspring or other susceptible fish. All efforts to isolate virus from tissues of suspected adult carrier fish have failed even though the presence of strong neutralizing antibody in these fish indicated that they had been previously exposed. A total of 298 organ, tissue or excretory product samples were assayed from 62 adult fish. The virus was not recovered from any of these samples even though the fish had produced virus-infected offspring in previous years. The kidney, liver and intestine of virus injected fingerling channel catfish are primary organs of infection. In experimentally infected fingerling channel catfish a temperature reduction from 27-28C to 18-19C 24 hours after infection reduced mortality 60-80% and 5-35% when temperature was reduced on appearance of clinical signs of the disease. (Jones-Wisconsin)
W74-00231

EFFECTS OF UNDERWATER DEMOLITION ON THE ENVIRONMENT IN A SMALL TROPICAL MARINE COVE,
Naval Underwater Systems Center, New London, Conn. New London Lab.
C. L. Brown, Jr., and R. H. Smith.
Available from the National Technical Information Service as AD-754 395. Technical Report 4459, December 1972. 18 p, 7 fig, 4 ref. A-626-11.

Descriptors: *Explosives, *Underwater, *Environmental effects, Excavation, Marine biology, Bays, *Puerto Rico, Sound waves.
Identifiers: *Cross Cay (P.R.).

Use of 4000 lb of explosives in a small cove on Cross Cay, off Puerto Rico, to clear a beach area for an access road and remove underwater and awash coral heads and boulders to create a boat lane, prompted assessment of the blasting impact on the environment and measurement of the acoustic-pressure levels and effect of the demolition on marine life. By positioning the charges, a large portion of the energy was dissipated skyward. As a result of the precautions taken to minimize damage to the environment, at a distance of 350 yd from the demolition area, the largest of the three blasts produced a pressure level of only 9.15 lbf/sq in. The prediction of a shadow-zone effect was apparently correct, since, in the deeper water outside the cove, very little damage was noticeable--only three dead fish were found. Within two hours after the last and most powerful explosion, schools of fish were observed in that area. On the following day, more fish were in the cove, indicating that the area could be recolonized in a short time. (Jones-Wisconsin)

MUTATIONS ARISING DURING TRANSFORMATION IN THE BLUE-GREEN ALGA ANACYSTIS NIDULANS,
Liverpool Univ. (England). Dept. of Biochemistry.
M. Herdman.
Molecular and General Genetics, Vol 120, No 4, p 369-378, 1973. 4 tab, 15 ref.

Descriptors: *Genetics, *Cyanophyta, Aquatic plants, *Algae.
Identifiers: *Anacystis nidulans, *Mutations, Procaryotic organisms, DNA.

The blue-green algae comprise a large, structurally and physiologically diverse, group of procaryotic organisms whose genetics, in contrast to the bacteria, have been scarcely examined. Genetic transformation of Anacystis nidulans is described and evidence provided that genetic recombination is associated, at high frequency, with mutation. Donor material was used from two sources, namely chemically extracted DNA and extracellular nucleic acids. A high proportion of the transformants became mutant at sites which were wild type in both parental strains. Linkage was less extensive in transformation mediated by chemically extracted DNA, and this increased frequency of recombination was associated with enhanced mutation frequencies. The frequencies of recombination and mutation were varied to the same extent by changing the DNA concentration, and both processes were prevented by pretreatment of donor DNA with DNase. Mutational events are, therefore, closely associated with recombination in A. nidulans. The mutations are revertible and are therefore not deletions. If the mechanism of this mutational process in A. nidulans is similar to that in other organisms, then the high frequency of the phenomenon in this organism may greatly facilitate further study of the nature of this mutagenic step in recombination. (Jones-Wisconsin)

CO2 FIXATION BY THE BLUE-GREEN ALGA ANACYSTIS NIDULANS,
Dalhousie Univ., Halifax (Nova Scotia). Dept. of Biochemistry.
E. R. Jansz, and F. I. Maclean.

Canadian Journal of Microbiology, Vol 19, No 4, p 497-504, 1973. 7 tab, 26 ref.

Descriptors: *Carbon cycle, *Carbon dioxide, *Cyanophyta, Biochemistry, Cytological studies, Enzymes, Amino acids, Photosynthesis.
Identifiers: *Anacystis nidulans, *Carbon dioxide fixation, Carboxylation, Transcarboxylation.

Route of carbon dioxide fixation was investigated by examining early products of carbon dioxide fixation in Anacystis nidulans, and by investigating in cell extracts possibilities for carboxylation and transcarboxylation reactions. Two types of patterns were observed: In type I fixation 3-phosphoglycerate was the most heavily labeled initial product and in type II fixation the most intensely labeled initial product was aspartate. In type II patterns the bulk of the label in aspartate was in C4 suggesting a carboxylation of phosphoenolpyruvate. C14 incorporation into oxaloacetate was found much less than into aspartate. Ribulose-1,5-diphosphate carboxylase activity (sufficient to account for 20% manometric photosynthesis rates) and phosphoenolpyruvate carboxylase activity (sufficient to account for whole-cell rates of aspartate synthesis) were observed in cell-free extracts. Phosphoenolpyruvate-stimulated carboxylation of ribulose diphosphate was not detected indicating the label in aspartate was not a reflection of a pathway involving transcarboxylation of oxaloacetic acid. Early label detected in glutamate-1-C14 probably arose from oxaloacetate-4-C14 via citric acid cycle rather than by reductive carboxylation of succinic acid as a-ketoglutarate synthetase activity was not detected in extracts. Calvin cycle was the major route of carbon dioxide fixation. A second, minor path was carboxylation of phosphoenolpyruvate. (Jones-Wisconsin)

LIMITING STEPS IN PHOTOSYSTEM II AND WATER DECOMPOSITION IN CHLORELLA AND SPINACH CHLOROPLASTS,
Institut de Biologie Physico-Chimique, Paris (France).
B. Bouges-Bocquet.
Biochimica et Biophysica Acta, Vol 292, No 3, p 772-785, 1973. 7 fig, 18 ref.

Descriptors: *Photoactivation, *Biochemistry, *Chlorella, Photosynthesis, Activation energy, Chemical reactions.
Identifiers: *Chloroplasts, Photosystem II.

During water decomposition and oxygen evolution performed by Photosystem II in green plants, it has been shown that four consecutive photochemical reactions per center are necessary for an oxygen molecule production. States refer to the general state of a center which comprises its oxidizing and reducing sides, and differs according to the number of charges stored on the oxidizing side of Photosystem II. During a short flash a photochemically inactive state is formed. A dark reaction leads to the photochemically active state. During a short saturating flash, each photochemical center reacts once and only once. Only states So and Sl are stable in the dark where there is an equilibrium between So and Sl. New results with regard to this equilibrium are presented which provide a useful tool for study of reactions. By varying redox potential of a chloroplast suspension, new evidence was obtained for an equilibrium between state So and Sl. Limiting steps between two consecutive photoreactions of System II in Chlorella and spinach chloroplasts and the limiting steps in the presence of low concentration of hydroxylamine were studied. Results favor the binding of two molecules of hydroxylamine to every photochemical center. (Jones-Wisconsin)
W74-00238

THE EFFECTS OF CARBON DIOXIDE CONCENTRATION ON OXYGEN EVOLUTION AND FLUORESCENCE TRANSIENTS IN SYNCHRONOUS CULTURES OF CHLORELLA PYRENOIDOSA,
Rochester Univ., N.Y. Dept. of Biology.
R. E. Slovacek, and T. T. Bannister.
Biochimica et Biophysica Acta, Vol 292, No 3, p 729-740, 1973. 8 fig, 27 ref.

Descriptors: Biochemistry, *Photosynthesis, *Carbon dioxide, *Fluorescence, Chlorella, *Photosynthetic oxygen, Chlorophyll, Bioluminescence, Cytological studies.
Identifiers: *Fluorescence transients, *Chlorella pyrenoidosa, Electron transport.

A new example of parallelism of electron transport and fluorescence is added in which parallelism is manifested not only in the steady-state (fluorescence and oxygen evolution declining together as CO2 concentration falls), but also during induction (both oxygen evolution and fluorescence first increasing in the M2-P3 phase, then falling during the P3-S phase). Steady-state fluorescence yield of Chlorella pyrenoidosa is strongly affected by carbon dioxide concentration, being approximately two-fold higher in presence than in absence of carbon dioxide. In the presence of saturating carbon dioxide during induction, accelerating oxygen evolution is paralleled by rising fluorescence; in the absence of carbon dioxide, fluorescence yield remains at low level. Both illumination and carbon dioxide content are important in determining the steady-state fluorescence yield: at lower illuminations, lower concentrations of carbon dioxide are required to obtain a maximum fluorescence yield. The effects of carbon dioxide on induction in 16-hour cells are shown. The carbon-dioxide dependent fluorescence rise is most readily observed in cells harvested early in the light period of a synchronous culture, but it can also be elicited in cells harvested during the dark period. Addition of DCMU to carbon dioxide-deprived cells raises the fluorescence yield approximately four-fold. (Jones-Wisconsin)

Marine Biology, Vol 19, No 4, p 323-331, 1973. 3 fig, 3 tab, 29 ref.

Descriptors: *Silica, Biochemistry, *Cytological studies, *Diatoms, *Amino acids, Carbohydrates, Evolution.
Identifiers: *Silicification.

Knowledge of the chemical composition of the organic coating of diatom cell walls may clarify the silicification mechanism. Studies of the cell wall composition may offer a new approach to diatom taxonomy and evolution if the cell wall constituents are as variable as the frustule microstructure, now the basis of diatom systematics. Understanding molecular nature of this organic coating and its probable fate in aquatic and sedimentary environments has important consequences for the geochemical cycle of silica and for paleoecological studies. Amino acid and sugar composition of cell walls from six diatom species are described. Species were selected on the basis of taxonomic and habitat diversity, as well as availability in culture. When compared to cellular protein, cell-wall protein is enriched in serine plus threonine and glycine, and depleted in acidic, sulfur-containing and aromatic amino acids. Sugars of the cell-wall carbohydrates are quite variable, and fucose tends to replace glucose in estuarine species. Condensation of silicic acid, in epitaxial order, on a protein template enriched in serine and threonine, is suggested as the Si-depositing mechanism. Nature of this template and polysaccharides in the cell wall may determine diatom frustule solubility in various environments. (Jones-Wisconsin)

EFFECTS OF ARTIFICIAL DESTRATIFICATION ON ZOOPLANKTON IN PARVIN LAKE, COLORADO,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Fisheries and Wildlife Sciences.
R. T. Lackey.
Transactions of American Fisheries Society, Vol 102, No 2, p 450-452, 1973. 1 tab, 8 ref.

Descriptors: *Destratification, *Zooplankton, *Colorado, Crustaceans, Daphnia, Rotifers, Copepods, Spatial distribution, Water management (Applied).
Identifiers: *Parvin Lake (Colo.), Daphnia schodleri, Diaptomus.

Lake destratification is becoming an increasingly common tool in attempts to solve certain water management problems, but effects on biological components have been poorly defined. Effects of destratification on zooplankton abundance and depth distribution of Parvin Lake, Colorado, are described. This lake, a 19 ha montane reservoir, was artificially destratified for one year. The study consisted of a control year (November 1968-October 1969) and a treatment year (November 1969-October 1970). During the treatment year the destratification system was in continuous operation. Zooplankton was sampled at three stations: the deepest part of the lake (10m), the 6-m contour, and the 2-m contour. Horizontal differences in abundance between stations were not detected by initial data analysis, so counts for a given stratum were averaged. From these average values, a lake mean for each taxon was calculated. Abundance of cladocerans (collectively) was lower during winter months and higher during summer months of the destratification year. Abundance of copepods (mainly Diaptomus spp.) was not statistically different during destratification. Depth distribution of zooplankton was generally unaffected, but Diaptomus tended to occur in deeper water during the destratification year. (Jones-Wisconsin)

LAKE HURON: EFFECTS OF EXPLOITATION, INTRODUCTIONS, AND EUTROPHICATION ON THE SALMOID COMMUNITY,
Department of Lands and Forests, Maple (Ontario). Research Branch.
A. H. Berst, and G. R. Spangler.
Journal Fisheries Research Board of Canada, Vol 29, No 6, p 877-887, 1972. 8 fig, 27 ref.

Descriptors: *Fish populations, *Lake Huron, *Fish harvest, *Salmonids, Commercial fishing, Fish food organisms, Water pollution effects, Pollutants, Nets, Sport fish, Lake fisheries, Lake trout, Chinook salmon, White bass, Competition, Walleye, Predation, Thermal pollution, Exploitation, Cisco, Suckers, Yellow perch, Carp, Sauger, Pikes, Rainbow trout, Brown trout, Smelts, Salmon.
Identifiers: Burbot, Whitefish, Lake sturgeon, Chubs, Alewives, Splake, Coho salmon, Kokanee salmon.

A dramatic decline in commercially valuable fish and an instability in fisheries resources has occurred in Lake Huron since the 1940s, although the water quality has deteriorated only slightly since the early 1800s. The only significant water quality changes are confined to areas adjacent to centers of human activity, chiefly Saginaw Bay and harbors and estuaries in Georgian Bay and the North Channel. The lake has supported a commercial fishery which produced annual catches as high as 13,000 metric tons. Sea lamprey invasion had a leading role in adversely affecting the fisheries together with instances of over-fishing and water quality deterioration in Saginaw Bay with the resultant dramatic changes in fish populations. Although lake trout in the major basins were exterminated by lampreys, other large species including rainbow trout, whitefish, suckers, and burbot have

persisted. The present depressed state of the fisheries will undoubtedly continue until sea lamprey control is achieved and climax predator are reestablished. Canadian and United States governments are proceeding toward water quality criteria and fishery management practices which, hopefully, will stabilize the fisheries and prevent further deterioration. (Jones-Wisconsin)

ORIENTATION OF CHLOROPHYLL IN VIVO. STUDIES WITH MAGNETIC FIELD ORIENTED CHLORELLA,
New York Univ., New York. Radiation and Solid State Lab.
J. F. Becker, N. E. Geacintov, F. Van Nostrand, and R. Van Metter.
Biochemical and Biophysical Research Communications, Vol 51, No 3, p 597-602, 1973. 2 fig, 16 ref.

Descriptors: Biochemistry, *Chlorophyll, *Cytological studies, *Anisotropy, *Chlorella, Lipids, Fluorescence, Pigments, Molecular structure, Polarity.
Identifiers: Orientation, Fluorescence polarization, Chloroplasts, Magnetic field.

The study of orientation in magnetic fields yields information about the orientation of pigments in vivo. It is shown that oriented forms of chlorophyll are most probably responsible for the observed magnetic phenomena, rather than the lipid molecules. Studies of the wavelength dependence of the fluorescence polarization indicate that the bulk of the chlorophyll-a is highly oriented, whereas the short wavelength spectroscopic forms of chlorophyll are either unoriented or possess a low degree of orientation. The orientation of whole cells of Chlorella pyrenoidosa in aqueous suspensions is due to the anisotropy in the diamagnetic susceptibility of oriented chlorophyll molecules. The lipid molecules tend to align with their long axes parallel to the magnetic field and the red Q-y transition moment of chlorophyll perpendicular to the field, thus in the plane of the lamellae. The plane of the porphyrin rings tends to be parallel to the magnetic field because of the large diamagnetic susceptibility perpendicular to the ring. The porphyrin ring planes tilt away from the lamellar plane by an angle greater than 45 degrees. The short wavelength spectroscopic forms of chlorophyll are unoriented. (Jones-Wisconsin)

HOLOGRAPHIC MICROSCOPY OF DIATOMS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Physics.
S. P. Almeida, D. R. Del Balzo, J. Cairns, Jr., K. L. Dickson, and G. R. Lanza.
Transactions of the Kansas Academy of Science, Vol 74, No 3 and 4, p 257-260, 1971. 2 fig, 10 ref.

Descriptors: *Analytical techniques, *Microscopy, *Cytological studies, *Diatoms, Cameras.
Identifiers: *Holographic microscopy, Cyclotella, Navicula.

Holographic microscopy techniques provide another means for enhancing the study of microscopic organisms. One method for producing diatom holograms is presented. Characteristic of this group of microorganisms is encasement in a fairly rigid silicon dioxide frustule and a reasonable degree of transparency. The transparency factor led to a highly illuminated background which, in initial experiments, gave rise to poor holograms. Subsequent technique modifications corrected this situation. A schematic of the optical system used to construct and reconstruct diatom holograms is given. A 15mW Helium-Neon gas laser provides the coherent light source. After the variable beam splitter, two spatial filters SP1 and SP2 of 25 and 12 microns diameter respectively and 20X are used to render the beam relatively clean from diffraction by dust particles preceding them in the optics. The signal beam is then passed through a Bausch and Lomb micro-projector in order to magnify the specimen. The excess background light accompanying the micro-projected image which produced inadequate holograms is corrected. The reconstructed images of Navicula sp. and Cyclotella sp. holograms are photographed. (Jones-Wisconsin)

WATER QUALITY AND FISH LIFE BELOW SEWAGE OUTFALLS,
Maryland Univ., College Park. Natural Resources Inst.
Chu-fa Tsai.
Transactions of the American Fisheries Society, Vol 102, No 2, p 281-291, 1973. 9 fig, 1 tab, 23 ref.

Descriptors: *Outfall sewers, *Water pollution effects, *Fish, *Sewage effluents, *Outlets, Sewage treatment, Virginia, Maryland, Pennsylvania, Chlorine, Turbidity, Alkylbenzene sulfonates, Toxins, Conductivity, Ammonia.
Identifiers: Species diversity.

The relationship s between degree of water quality degradation and degree of fish community depletion below sewage effluent outfalls were studied. The objectives were to find the maximum limit of water quality degradation for each fish species, and eventually to establish water quality criteria to protect fish communities in sewage-polluted streams. Comparative studies were made of water quality and fish species diversity in stream locations immediately above and below the outfalls of 149 secondary sewage treatment plants in Virginia, Maryland, and Pennsylvania. There was a wide variation among species in sensitivity to total chlorine and turbidity parameters. While present technology does not approach that stage of complete sewage purification that will meet a stream's needs, natural purification may be considered as a supplement to present sewage treatments. To help achieve appropriate water quality objectives, several modifications of plant design and site selection for sewage disposal are proposed. Although sewage disinfection by chlorination is essential at present, in order to avoid damage to fish life, dechlorination by means of effluent holding lagoons, in addition to engineering facilities at sewage treatment plants, are recommended. (Jones-Wisconsin)

PHYSICAL AND CHEMICAL LIMNOLOGY OF LAKE LEAKE AND TOOMS LAKE, TASMANIA,
Tasmania Univ., Hobart (Australia). Dept. of Botany.
R. L. Croome, and P. A. Tyler.
Arch Hydrobiol. Vol 70, No 3, p 341-354, 1972. Illus.
Identifiers: *Australia (Tasmania lakes), Lakes, *Limnology, Minerals, *Ions.

The physico-chemical limnology of 2 shallow lakes in eastern Tasmania, Australia is described. They are characterized as oligotrophic, homothermic, O2 saturated and turbid. The cationic dominance order Na > Mg > Ca > K occurs in water, ooze and inflows. Total ionic concentrations are less than 1 meq/1. Slight differences in limnology are related to lake shape and catchment ecology.--Copyright 1973, Biological Abstracts, Inc.

POLLUTED SNOW IN SOUTHERN NORWAY AND THE EFFECT OF THE MELTWATER ON FRESHWATER AND AQUATIC ORGANISMS,
Oslo Univ. (Norway). Zoological Lab.
A. Hagen, and A. Langeland.
Environmental Pollution, Vol 5, No 1, p 45-57, July 1973. 5 fig, 4 tab, 29 ref.

Descriptors: *Melt water, *Water pollution effects, *Aquatic animals, Snowmelt, Oligotrophy, Dystrophy, Physicochemical properties, Surface waters, Iced lakes, Snow cover, Trophic level, Chemical analysis, Water analysis, Acidity, Nitrates, Sulfates, Zinc, Heavy metals, Water quality, Environmental effects, Sampling, Hydrogen ion concentration, Electrical conductance, Conductivity, Alkalinity, Nitrogen, Nitrates, Sulfates, Calcium, Magnesium, Lead, Iron, Manganese, Cadmium, Copper, Oligochaetes, Zooplankton, Biota, Benthic fauna, Water pollution, Clams, Midges.
Identifiers: *Snow contamination, *Norway, Ovre Lomtjorn, Lake Flovatn, Sialis, Chironomids, Pisidium.

In winter, surface water in some oligo-dystrophic lakes in southern Norway differed physico-chemically from what might be expected. Analyses of snow and of ice-trapped and surface water showed that polluted snow had a considerable influence on the quality of water in lakes and brooks in the winter and spring. Great quantities of, for example, SO4 (2 minus), NO3 (minus), Zn and Pb were found together with high acidity. The Zn concentration and acidity found are known to be dangerous to fish. The contaminants in general have probably had a negative effect on fish and invertebrates. It is probable that oligotrophic lakes are more susceptible to contamination than dystrophic lakes. (Holoman-Battelle)

ORGANOCHLORINE RESIDUES IN ESTUARINE MOLLUSKS, 1965-72 - NATIONAL PESTICIDE MONITORING PROGRAM,
Environmental Protection Agency, Gulf Breeze, Fla. Office of Pesticide Programs.
P. A. Butler.
Pesticides Monitoring Journal, Vol 6, No 4, p 238-362, March 1973. 15 fig, 20 tab, 17 ref.

Descriptors: *Mollusks, *Chlorinated hydrocarbon pesticides, *Polychlorinated biphenyls, *Pesticide residues, *Pollutant identification, Clams, Mussels, Oysters, Persistence, Watersheds (Basins), Path of pollutants, Chemical analysis, Water sampling, Invertebrates, Aquatic animals, Marine animals, Endrin, DDT, Insecticides, DDD, Monitoring, DDE, Dieldrin, Aldrin, Heptachlor, Solvent extractions, Water pollution sources, Benthic fauna, Chesapeake Bay, Delaware River, Estuaries, River basins.
Identifiers: *Biomonitoring, Sample preparation, Data interpretation, Chemical recovery, Coastal waters, Bioaccumulation, Marine environment, Fate of pollutants, Machipongo River, Rappahannock River, York River, James River, Elizabeth River, Lynnhaven Bay, Sequim Bay, Puget Sound, Samish Bay, Padilla Bay, Lummi Bay, Bear River, Naselle River, Nemah River, Macroinvertebrates, Quahog, Soft shell clam, Mirex.

The development of the national program for monitoring estuarine mollusks in 15 coastal states is described and the findings for the period 1965-72 are reported. The report is presented in two parts: Part I. General Summary and Conclusions, and Part II. Residue Data - Individual States. Analyses of the 8,095 samples for 15 persistent organochlorine compounds showed that DDT residues were ubiquitous; the maximum DDT residue detected was 5.39 ppm. Dieldrin was the second most commonly detected compound with a maximum residue of 0.23 ppm. Endrin, mirex, toxaphene, and polychlorinated biphenyls were found

only occasionally. Results indicate a clearly defined trend towards decreased levels of DDT residues, beginning in 1969-70. At no time were residues observed of such a magnitude as to imply damage to mollusks; however, residues were large enough to pose a threat to other elements of the biota through the processes of recycling and magnification. A SYSTEMATIC SURVEY OF INTERTIDAL OYSTERS IN THE SAVANNAH RIVER BASIN AREA OF SOUTH CAROLINA,
South Carolina Wildlife and Marine Resources Dept., Charleston. Marine Resources Center.
M. D. McKenzie, and A. C. Badger.
Available from NTIS, Springfield, Va., 22151 as COM-72-11059 Price $3.00 printed copy; $1.45 microfiche. Bears Bluff Laboratories Contribution No 50, February 1969. 15 p, 4 fig, 2 tab, 8 ref.

Descriptors: *Oysters, *Water pollution effects, *Estuaries, *South Carolina, Fisheries, Shellfish, Surveys, Fish populations, Spawning, Growth rates, Fish management, Ecosystems, Ecology, Aquiculture.
Identifiers: *Wright River (SC), *New River (SC).

Surveys of the position, extent, and biological characteristics of intertidal oyster beds in the Wright-New River area of South Carolina were conducted in 1965 and 1968. Results were compared with earlier surveys. The Wright-New River area is a highly productive seed oyster area. Although pollution is a major problem, oysters appear to thrive within the septic zone, and consequently, are in a condition of overcrowding. Ecologically, this situation is not advantageous for harvesting shucking stock at the present time. However, such conditions can be profitably utilized in establishing seed areas for the sole purpose of rearing oysters for transplantings. Assuming these waters could be deemed suitable for the cultivation of oysters fit for human consumption, a highly desirable variety of oysters could probably be harvested within two years following applied techniques of aquiculture. PROVOKING EFFECT OF IODOBROMIC WATERS IN LEPROSY, (IN RUSSIAN),
P. M. Zorin.
Vestn Dermatol Venerol. Vol 46, No 2, p 66-68, 1972. English summary.
Identifiers: Human diseases, *Iodobromic water, *Leprosy, Water.

A woman of 58 who started balneological treatment for hypertension of II A degree and nonspecific polyarthritis developed after 5 iodobromic baths numerous spots and plaques which were diagnosed as leprosy of lepromatous type. The diagnosis was subsequently confirmed by bacterioscopic immunologic and histopathological examinations. Anamnestically similar efflorescences was observed during the past 2 yr, but their nature was not recognized in time. Before admission to balneological therapy manifestations of leprosy were absent. As a result of resorption from the bath of iodine to which patients with leprosy are particularly sensitive, the patient developed clinical exacerbat on of leprosy. Physicians of resorts and local balneoclinics should carefully study all patients arriving for treatment in order not to overlook patients with leprosy.--Copyright 1973, Biological Abstracts, Inc.

THE EFFECT OF FEEDING LAYING HENS VARIOUS LEVELS OF COW MANURE ON THE PIGMENTATION OF EGG YOLKS,
Tennessee Univ., Knoxville. Dept. of Poultry.
L. H. Littlefield, J. K. Bletner, and O. E. Goff.
Poultry Science, Vol 52, No 1, p 179-181, January, 1973. 3 tab, 10 ref.

Descriptors: *Recycling, Cattle, *Farm wastes, Poultry, *Diets.
Identifiers: *Blood xanthophyll levels, *Yolk pigmentations, Blood.

Dried cow manure was added at the rate of 0, 2.5, 5, or 10 kilograms per 100 kilograms of diets containing 0 and 23 milligrams of xanthophylls per kilogram of diet to determine the effect on blood xanthophyll levels and the pigmentation of yolks produced by hens on these diets. There was a high positive linear correlation between the amount of cow manure added and the amount of xanthophyll in the blood, the amount of xanthophyll in the egg yolk, and the yolk visual score. There was a high negative linear correlation between pigmenting efficiency and the amount of cow manure added to the diet. Although cow manure was a good source of xanthophylls, it was not efficiently utilized by the hen as a source of xanthophylls. (East Central)

TOXICITY OF DROPPINGS FROM COUMAPHOS-FED HENS TO LITTLE HOUSE FLY LARVAE,
Massachusetts Univ., Amherst. Dept. of Entomology and Plant Pathology.
J. W. Eversole, J. H. Lilly, and F. R. Shaw.
Journal of Economic Entomology, Vol 58, No 4, p 709-710, August 1965. 1 tab, 4 ref.

Descriptors: *Poultry, *Farm wastes, *Toxicity, *Insecticides, Massachusetts.
Identifiers: Flies, Larval mortality, Coumaphos oraldrench powder, Fannia canicularis, White leghorn hens.

White leghorn hens were fed mixtures of 50% coumaphos oral drench powder, and pelleted poultry feed. The insecticide levels were 0, 25, 75, and 125 mg of active ingredient per kg of feed. The mean mortalities of larvae of Fannia canicularis (L) exposed to the droppings from these birds were 7.3, 18.0, 42.5, and 91.0%, respectively. Therefore coumaphos provided an effective degree of control when fed at the 125 mg/kg level. By a comparison of the concentrations of coumaphos required to produce approximately 90% mortality of the fly larvae in this field test with the results of laboratory tests, it was estimated that approximately a 70-fold decrease in effectiveness occurred during passage of the insecticide through the birds. OBSERVATIONS ON THE NITROGEN FIXING POTENTIAL OF THE SURFACE WATERS OF A LARGE IMPOUNDMENT,
Oklahoma State Univ., Stillwater. Dept. of Zoology.
R. W. Hall, Jr., and D. W. Toetz.
The Southwestern Naturalist, Vol 18, No 1, p 94-97, March 30, 1973. 3 fig. OWRR A-012-OKLA. (3), FWQA 5+1-UP-185-01.

Descriptors: *Nitrogen fixation, Reservoir, Nitrate, Ammonia, Light, *Oklahoma, Impoundments, *Cyanophyta, Seasonal.
Identifiers: *Keystone Reservoir (Okla), Inoculum.

Information of comparative limnological interest is provided on the nitrogen fixing potential of the surface waters of Keystone Reservoir, Oklahoma, and the annual cycle there of phenomena, which can control the rate of N2 fixation: temperature, light as Secchi disc transparency, the concentrations of inorganic nitrogen and species composition of the phytoplankton. The surface water of this lake had a very low N2 fixing potential, since acetylene reduction was not observed. Limnological conditions were favorable for N2 fixation by blue-green algae during the summer. However, the following blue-green algae, identified in plankton samples, are not known to fix N2: Chroococcus, Merismopedia, Oscillatoria and Lyngbya. It is speculated that N2 fixing algae did not develop a bloom because of the lack of a suitable inoculum.

ECOLOGY AND PRODUCTION OF THE PROFUNDAL BENTHOS IN RELATION TO PHYTOPLANKTON IN LAKE ESROM,
Copenhagen Univ. (Denmark). Freshwater Biological Lab.

P. M. Jonasson.
OIKOS Supplementum, Vol 14, p 1-148, 1972. 94 fig, 45 tab, 357 ref.

Descriptors: *Benthic fauna, *Ecology, *Phytoplankton, *Secondary productivity, *Profundal zone, *Hypolimnion, *Environmental effects, Aquatic insects, Food habits, Life cycles, Growth rates, Mollusks, Annelids, Biorhythms, Mortality, Dominant organisms, Annual turnover, Standing crops, Aquatic plants, Crustaceans, Aquatic algae, Aquatic bacteria, Energy budget, Rotifers, Invertebrates, Tubificids, Benthos, Midges, Diptera, Eutrophication, Trophic level, Carnivores, Food chains, Water properties, Ice cover, Primary productivity.
Identifiers: Seasonal variation, Insect physiology, Nutrient supply, Seasonal succession, Energy flow, *Denmark (Lake Esrom), Detritivores, Transparency, Macrophytes, Chironomus anthracinus, Chironomids, Ilyodrilus hammoniensis, Pisidium casertanum, Chaborus flavicans, Procladius pectinatus, Macroinvertebrates, Chemical composition, Biochemical characteristics, Population density, Phantom midges, Nutrient availability.

Morphometric and environmental data of the 17.3 sq km and 22 m deep dimictic, eutrophic Lake Esrom, Denmark are given. The seasonal variation in solar radiation, temperature, oxygen, specific conductivity, pH, transparency, ionic composition, and its relationship to primary production of phytoplankton was measured over 10 years. A spring maximum of diatoms usually occurs in April after the ice cover has gone and a summer maximum of bluegreens occurs in August. The seasonal succession is correlated with duration of ice cover, solar radiation, temperature, and nutrient supply. Mean annual phytoplankton gross production was 260 g C/sq m/yr, with a range from 170 to 330 g C/sq m/yr (2,440 kcal/ sq m/yr). Net production, estimated as 75 percent of the gross production, consequently, was 195 g C/sq m/yr (1,830 kcal/sq m/yr). A comparison is made with some 20 lakes, mostly Danish, on a yearly basis. The essential relationships between environment, food, growth, life cycles, and population dynamics are described for three detritivores and two carnivores: Insects dominate secondary production, which amounts to 100 kcal/sq m/yr. Mortality in the detritivore is high (3.59 kcal/sq m/yr) but lower in the carnivores (2.6 and 1.3 kcal/sq m/yr). Other losses are due to emergence. Turn over rates are rather low. Respiratory metabolism of the benthos includes measurements of aerobic population respiration of the five species at all seasons. Community respiration of the macrofauna amounted to 432 kcal/sq m/yr, or more than four times the secondary production. The production of profundal benthos in the lake is compared with the estimated production of zooplankton and the trophic relations between phytoplankton, zooplankton and benthos are discussed. This provides a broad picture of the energy flow in the lake. (Holoman-Battelle)

METABOLIC EFFECTS OF TECHNICAL PENTACHLOROPHENOL (PCP) ON THE EEL ANGUILLA ANGUILLA L.,
National Board of Fisheries, Goteborg (Sweden).
B. Holmberg, S. Jensen, A. Larsson, K. Lewander, and M. Olsson.
Comp Biochem Physiol B Comp Biochem. Vol 43, No 1B, p 171-183. 1972. Illus.
Identifiers: *Anguilla-anguilla, *Eels, *Metabolism, *Pentachlorophenol, Pesticides, Phenols.

Eels (A. anguilla L.) were exposed to sea water and fresh water containing 0.1 ppm pentachlorophenol (PCP). The accumulation of the pesticide as well as the effects on different metabolites in blood, muscle and liver were studied. PCP exposure caused changes, indicating a hypermetabolic state with accelerated utilization of tissue energy reserves. An altered cholesterol metabolism, a decreased activity of liver glutamate pyruvate transaminase (GPT) and an enlargement of the liver suggested a disturbed liver function. The effects of PCP seemed to persist in spite of a recovery period in clean water for about 2 mo.--Copyright 1973, Biological Abstracts, Inc.

ECOLOGICAL STUDIES ON THE PENAEUS ORIENTALIS KISHINOUE CULTURED IN A POND FILLED WITH SEA WATER: I. GROWTH RATE AS RELATED TO THE SUBSTRATE MATERIALS, SURVIVAL RATE, PREDATOR OF P. ORIENTALIS, AND WATER CONDITIONS OF CULTURING POND,
Seoul National Univ. (Republic of Korea). Coll. of Education.
K. C. Choi, and Y. K. Song.
Bull Korean Fish Soc. Vol 4, No 2, p 47-54. 1971. Illus.
Identifiers: Acanthogobius-Flavimanus, Culturing, Ecological studies, *Growth rates, *Penaeus-Orientalis, Ponds, Predator, Sea water, Survival.

The differences in growth rate of P. orientalis cultured on muddy bottom region and sandy bottom region in a pond filled with sea water were studied. For the investigation of the growth rate, the body length and the body weight were determined. Five individuals from each experimental region were sampled at random. The samples were collected at 10-day intervals. The survival rate, the predator of P. orientalis, and the water conditions during the experimental period were also determined. The growth rate of P. orientalis which was cultured in the muddy bottom region was greater than that in the sandy bottom region, regardless of whether they were cultured with or without food. When the predator is not present, 84% of P. orientalis may survive. Acanthogobius flavimanus is one of the predator of P. orientalis. The variation of water conditions of the pond, in which water had been exchanged 12 times per month, did not affect to the survival rate of P. orientalis.--Copyright 1973, Biological Abstracts, Inc.

EFFECTS OF WATER POLLUTION ON THE ICHTHYOFAUNA: IV. TOXICITY OF ACIDS, ALKALIES AND SOME INORGANIC GASES,
P. Epler.
Postepy Nauk Roln. Vol 18, No 6, p 85-102. 1971. Illus.
Identifiers: *Acids, *Alkalies, Fauna, Fish, *Ichthyo-fauna, Inorganic gases, Pollution, *Toxicity, Water pollution.

Acids produce free CO2, which is lethal to fish, in water with a high bicarbonate content. Resistance to pH of the order of 3.6 rapidly grows with age in trout. Strong alkalies are toxic at pH above 10.0. Acids are generally toxic at pH below 4.0. A concentration of 1.5 mg CO/1 appears to be lethal. Free Cl is highly dangerous and forms chemical compounds of no lesser toxicity, such as chloramine and cyanogen (CN) chloride, toxic in amounts exceeding 0.1 mg ClCN/1.--Copyright 1973, Biological Abstracts, Inc.

Acta Pharmacol Toxicol. Vol 31, No 3, p 238-240. 1972. Illus.
Identifiers: *Goldfish, Nervous systems (Fish), *Toxicity, *Polychlorinated biphenyls, Fish pathology.

The harmful effects of PCB were easily observed. The fish lost their appetite and their bright orange color turned to pale yellow, the changes being most obvious with the highest concentrations of PCB. The effect on the nervous system was observed as uncoordinated movements after which the fish turned to side positions. To ensure that the effects were caused by PCB and not by starvation, another control group of 16 fishes were starved in clean water for 10 days. With exception of a 25% loss of weight and 2 deaths no abnormalities were noted.--Copyright 1973, Biological Abstracts, Inc.

INDUCTION OF MICROSOMAL LIVER ENZYMES AFTER POLYCHLORINATED BIPHENYLS (PCB) AND FOLLOWING STRESS, (IN GERMAN),
Hamburg Univ. (West Germany). Pharmakologisches Institut.
H. F. Benthe, A. Schmoldt, and H. Schmidt.
Arch Toxikol. Vol 29, No 2, p 97-106. 1972. Illus. (English summary).
Identifiers: *Enzymes, Human adipose tissue, Rat liver, Tissue, *Polychlorinated biphenyls.

One i.p. injection of PCB induces a high stimulation of rat liver microsomal drug oxidizing enzymes; equimolar doses of tetrachlorobiphenyls are distinctly more effective than dichlorobiphenyls. The effect can still be demonstrated distinctly 4 wk after application. During this time the liver concentration of tetrachlorobiphenyls decreased to 7 microgram/g tissue whereas the concentration of adipose tissue rose to 252 microgram/g. By stress tetrachlorobiphenyls are mobilized along with fat, causing an increase of liver concentration to 32 microgram/g. Simultaneously, a new stimulation of microsomal activity can be seen, nearly equal to the maximum stimulation 4 days after i.p. application of 500 mg.kg b.w. Parallel to microsomal stimulation there is an increase of relative liver weight. Stress induced activation of microsomal activity caused by PCB redistribution is important for the evaluation of PCB in environmental toxicology, in view of rising PCB concentrations in human adipose tissue.--Copyright 1973, Biological Abstracts, Inc.

ZOOBENTHOS RESOURCES AND PRODUCTIVITY IN THE GULF OF TAGANROG, (IN RUSSIAN),
Azovskii Nauchno-Issledovatelskii Institut Rybnogo Khozyaistva, Rostov-na-Donu (USSR).
M. Ya. Nekrasova.

Gidrobiol Zh. Vol 8, No 4, p 41-47. 1972. (English summary).
Identifiers: *Benthos, *Productivity, Salinity, *USSR (Taganrog Bay), Zoo benthos.

An evaluation was made of the fodder capacity of the Taganrog Bay, USSR, bottom fauna during the period of regulated flow of the Don. Resources P/B coefficients (ratio of productivity to the spring biomass) and productivity indices were calculated for this purpose. The highest P/B values was on the high and middle water level periods and was lowest on the lower water level periods. The low P/B values showed a decrease in zoobenthos reproductivity with decrease of the Don flow and increase of salinity in the bay.--Copyright 1973, Biological Abstracts, Inc.

HYDROGRAPHY, CHEMISTRY AND LOAD OF NUTRIENTS OF A MOUNTAIN STREAM POLLUTED BY ORGANIC WASTE WATER, (IN GERMAN),
Freiburg Univ. (West Germany). Limnologisches Institut.
U. Franke, and J. Schwoerbel.
Arch Hydrobiol Supplement B. Vol. 42, No 1, p 95-124. 1972. Illus. (English summary).
Identifiers: Bioactivity, Chemistry, *German (Mettma stream), Hydrography, Mountain streams, Nutrient load, Organic wastes, Polluted streams, Waste water, *Brewery effluents.

The Mettma stream, a small freshwater river in Germany polluted by brewery effluent, was investigated. Running water, in which organic nutrients are introduced, permanently changes its metabolism-type from the point of entry of the sewage. At the same time chemical conditions change. The stream purified itself. After a certain distance downstream there is a balance in metabolism just as there was above it, but the bioactivity is increased.--Copyright 1973, Biological Abstracts, Inc.

TWO STUDIES OF PESTICIDE RESIDUES,
Texas A and M Univ., College Station. Environmental Quality Program.
L. J. Dziuk, and R. E. Kramer.
Environmental Quality Note 13, July 1973. 47 p.

Descriptors: *Water pollution effects, *Pesticide residue, *Insecticides, *Ecosystems, Environmental effects, Ecology, Fish, Fish genetics, Fish reproduction, Surface waters, Cotton, Insect control, *Texas, Environmental effects, Aquatic life, Sampling, Resistance, Fish toxins, Data collections.
Identifiers: *Brazos County (Tex), *Burleson County (Tex).

The report includes the following: A Study of Pesticide Residue Levels and Insecticide Resistance in Selected Aquatic Organisms Occurring Around the Bryan - College Station Agricultural Production Areas, by L.J. Dziuk; and A Survey of DDT Residues in Fish From the Brazos and Navasota Rivers and Somerville Reservoir, by R. E. Kramer. The phenomena of pesticide transferal and biological magnification have aroused widespread interest in the sublethal effects of pesticides on fish. Reduced reproductive capability has been demonstrated as one sublethal effect on fish. Pesticides can affect the physiological processes of a fish to a point where normally nonlethal environmental stresses become lethal. Sublethal effects of several pesticides within the body of a fish may combine to cause death. Continued contamination of freshwater ecosystems with DDT has resulted in varying degrees of insecticide resistance in aquatic organisms. In areas where DDT has been applied for a number of years for control of insect pests, the nontarget organisms there have been conditioned, due to genetic adaptation, to live in the contaminated environment. A STUDY OF PESTICIDE RESIDUE LEVELS AND INSECTICIDE RESISTANCE IN SELECTED AQUATIC ORGANISMS OCCURRING AROUND THE BRYAN-COLLEGE STATION AGRICULTURAL PRODUCTION AREAS,
Texas A and M Univ., College Station. Environmental Quality Program.
L. J. Dziuk.
In: Two Studies of Pesticide Residues Environmental Quality Note 13, p 10-24, July 1973. 2 fig.

Descriptors: *Pesticide residues, *Insecticides, *Pollutants, *Water pollution effects, *Aquatic life, Analytical techniques, Sampling, Fish, Surface waters, Ecosystems, DDT, Insect control, Environmental effects, Resistance, Cotton, *Texas.
Identifiers: *Brazos County (Tex), *Burleson County (Tex).

One objective was to determine at what levels DDT and its metabolites were concentrated by the aquatic organisms at various places in an intensively managed cotton-growing area of Texas. A survey was made to find a series of sites that would reflect at least some degree of pesticide usage, ranging from high to virtually no contamination. A map of Brazos and Burleson Counties shows the locations of the sampling sites. Because DDT was not applied to the cotton fields in the immediate area during the sampling period, it appears that biological variability in the mosquitofish sampled may have played a large part in the extreme variation of the levels of p,p' - DDT from week to week. Insecticide resistance confers a survival advantage in an organism exposed to levels of insecticide that would prove fatal to susceptible populations. Brazos-R mosquitofish illustrate this point. DDT and toxaphene were both used in quantity in the immediate area of the fish population. These fish were able to withstand approximately 10 times more toxaphene than a susceptible population, and approximately 12 times as much DDT as the susceptible population. If resistance had not been developed to these two compounds, the mosquitofish population might not have been able to survive such adverse conditions. (See also W74-00529) (Woodard-USGS)
W74-00530

A SURVEY OF DDT RESIDUES IN FISH FROM THE BRAZOS AND NAVASOTA RIVERS AND SOMERVILLE RESERVOIR,
Texas A and M Univ., College Station. Environmental Quality Programs.
R. E. Kramer.
In: Two Studies of Pesticide Residues Environmental Quality Note 13, p 25-47, July 1973. 14 tab, 31 ref.

Descriptors: *Water pollution effects, *Aquatic life, *Pesticide residues, *Fish, Surface waters, Lentic environment, Lotic environment, Reservoirs, Rivers, *Texas, Environmental effects, Insecticides, DDT, Ecosystems.
Identifiers: *Burleson County (Tex).

Intensive agricultural activity in the Brazos Valley, Texas, has raised questions concerning insecticide residue presence and accumulation in fish from local agroecosystems. One lentic and two lotic systems were sampled. The lentic system is Somerville Reservoir in southern Burleson County. The two lotic systems are the Brazos and Navasota Rivers. Muscle tissue of fish from all three aquatic systems contained some measurable amount of either DDE, DDD, or DDT. DDT residues were detected in samples from both lotic systems but not in those from the lentic system. DDD and DDE were detected in samples from all three aquatic systems. Fish from the Brazos River contained the highest residues of all of the fish collected. All samples analyzed contained DDE in measurable quantities. Channel catfish contained the highest average level of DDE in the muscle tissue (0.309 ppm) of any species of fish collected from the river. Freshwater drum had only slightly lower average DDE levels (0.296 ppm) than channel catfish. The lowest average DDE levels were in carpsuckers at 0.163 ppm. DDD and DDT were confirmed in 52% of the samples analyzed. DDD and DDT could be quantitated only in tissue samples of channel catfish and were slightly more than 0.1 ppm. Carp was the only species other than channel catfish that consistently contained trace amounts of DDD and DDT in muscle tissue. (See also W74-00529) (Woodard-USGS)

5D. Waste Treatment Processes

DEVELOPMENT AND PILOT-TESTING OF AN AUTOMATIC INFORMATION DISSEMINATION SYSTEM.
Environmental Quality Systems, Inc., Rockville, Md.

Available from the National Technical Information Service as PB-224 501, $4.25 in paper copy, $1.45 in microfiche. Completion Report proposed for Water Resources Scientific Information Center, September 1973. 72 p, 2 fig, 2 tab, 31 ref, 6 append. OWRR W-175 (No 9075) (1).

Descriptors: *Mathematical models, Computer programs, *Information retrieval, Engineering, Design, *Waste water treatment, Computer models, Sewage treatment, Model studies, Abstracts.
Identifiers: *Information Centers and Services, *Content analysis, *Dissemination techniques, *Consulting engineers, *Facility design, Information systems, Information Storage and Retrieval.

An Automatic Information Dissemination System (AIDS) flexible enough to accommodate a wide variety of user needs for technical information was developed and successfully pilot-tested. Methods for accelerating the application of research results were studied using mathematical models and computer programs useful in the design of wastewater treatment facilities as a sample technical area. Engineering firms with design experience were directly consulted to verify their needs for models and programs, and to solicit their views on effective dissemination techniques. Based on the engineers' comments, a system was developed to satisfy individual information needs by automatically disseminating the appropriate level of detail on each model or program. The levels of detail are cumulative so that in any one consulting organization some individuals may receive general notification (Step I), while others who have direct interests and responsibilities for models and programs can receive progressively more detailed information. Some individuals would received a detailed assessment of the model's utility and a description of the reference documents available (Step II). A few individuals would receive the actual documents (Step III), and one person would receive all of the foregoing information, plus the source deck, a user's manual, and other pertinent materials (Step IV). If required, extension services would be available (Step V). Results are reviewed. Recommendations included a field evaluation and subsequent large-scale implementation. (Gaughan-EQSI)

SEWAGE TREATMENT METHOD AND APPARATUS,
Y.S. Lin, and C. F. Chang.
U. S. Patent No. 3,753,897, 5 p, 3 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 913, No 3, p 948, August 21, 1973.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, *Aeration, Aerobic treatment, Activated sludge, Bacteria, *Reaeration, Water pollution control, Pollution abatement, Water quality control, Equipment, Treatment, *Sludge treatment.

Partitions within the main container of this sewage treatment apparatus define aeration, stabilization and sedimentation chambers. A digestion cavity is placed beneath the stabilization chamber. Raw sewage is first directed into the aeration chamber. Settled sludge is drawn from the stabilization chamber and introduced into the aeration chamber. The sludge mixes with the sewage to cause the bacteriological conversion of solids into a liquid suspension of activated sludge flocs. The suspension is then directed into the sedimentation chamber to separate out the sludge from the liquid. The separated sludge is directed back into the stabilization chamber where a portion of it is returned to the aeration chamber and a portion settles into the digestion cavity. The aerated sewage is then led from the aeration chamber into the stabilization chamber to reaerate the sludge therein as well as the sludge which settled in the digestive cavity. The liquid remaining in the sedimentation chamber is directed out of the apparatus as ready for disposal or reuse. (Sinha-OEIS)

FILTER MEDIA FOR LIQUID WASTES TREATMENT AND METHOD OF FORMING THE SAME,
Del-Pak Media Corp., Oakland, Calif., (Assignee)
E. R. Carlson.
U. S. Patent No. 3,750,887, 5 p, 5 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 913, No 1, p 187, August 7, 1973.

Descriptors: *Patents, *Liquid wastes, *Waste water treatment, *Filters, *Filtration, Equipment, Separation techniques, Pollution abatement, Water pollution control, Water quality control, Biological treatment.

Pallet-like units are used as biological growth supporting surfaces. They are placed so as to form a self supporting stackable structure. The positioning of the supporting parts enables stacking of the units in vertically superimposed, horizontally extending layers with some of the horizontal units staggered or displaced so that units overlap each other and provide stability in the filter array. The pallet-like units may be formed of redwood, pressure treated wood, or a plastic material. (Sinha-OEIS)

ENGINEERING ALTERNATIVES IN NATURAL RESOURCES DEVELOPMENT IN URBAN REGIONS,
Philadelphia Water Dept., Pa.
S. S. Baxter.
In: National Conference on Urban Water Research, March 17-19, 1970, Keynote and Plenary Session Papers. p 19-23. (1970).

Descriptors: Sewerage, Sewage systems, Sewage disposal, Waste water treatment, Water quality, *Regional development, *Alternative planning, *Water reuse, *Recycling, *Municipal water, Natural resources, Cities, Urbanization.
Identifiers: Engineering alternatives.

Historically the waters of streams and rivers have been used to transport and dispose of waste material. In recent years there has been growing pressure to recycle this water and reuse it. In determining whether to treat the water so that it is fit for reuse in metropolitan areas several alternatives have traditionally been considered. Among these are going to an upland source of water in a more sparsely developed area and providing the water for the city by damming up smaller streams; making the most modern treatment plants so the river can continue to be used as the original source; and cleaning the rivers to such a degree they approximate the condition of the upland source. Recent developments have made other alternatives worth considering. One of these is regional treatment of water. Another is parallel supply systems, one containing water fit for human consumption, and the other containing water treated only to eliminate disease, which water is fit for industrial use, street washing, fire fighting, toilet flushing and other uses. These alternatives are anlyzed. (See also W71-09468 and W71-09469) (Wadley-Florida)

PRESSURE SEWER DEMONSTRATION AT THE BOROUGH OF PHOENIXVILLE, PENNSYLVANIA,
General Electric Co., Philadelphia, Re-Entry and Environmental System Div.
G. Mekosh, and D. Ramos.
Copy available from GPO Sup Doc as EP1.23/2:73-270, $1.00; michrofiche from NTIS as PB-224 456, $1.45. Environmental Protection Agency, Technology Series, EPA-R2-73-270, July 1973. 70 p, 13 fig, 10 tab. EPA Project 11050 FOU.

Descriptors: Water pollution control, *Sewers, *Sewage disposal, Plastic pipes, *Pressure conduits, Data collections, Costs, *Pennsylvania.
Identifiers: *Pump-grinders, *Pressure sewers, System monitoring, Cost breakdown, Wastewater characterization, *Phoenixville (Penn).

A site was selected at the Borough of Phoenixville, Pennsylvania, which provided a maximum variable exercise of a pressure sewer system. The site consisted of five residences spread over more than one-half mile in hilly and predominantly shale-based terrain. The residences varied from a small house to a multiple-unit apartment house. The apartment house is more than half a mile in distance and 60 feet in elevation below the existing conventional gravity sewer inlet point. The project proved over a six-month period that a multiple residence pressure sewer system can adequately store peak loads of wastewater and grind and pump wastewater through small-diameter plastic pipe to the existing conventional gravity sewer. During the project, data was collected which provided information concerning the installation, operation and maintenance of the system, its technical performance, the variations in that performance during the six-month period and the characteristics of the wastewater as delivered to the existing gravity sewer. (Kreissl-EPA)

PHYSICAL-CHEMICAL TREATMENT OF A MUNICIPAL WASTEWATER USING POWDERED CARBON,
Envirotech Corp., Salt Lake City, Utah. Eimco Process Machinery Div.
D. E. Burns, and G. L. Shell.
Copy available from GPO Sup Doc as EP1.23/2:73-264, $2.25; microfiche from NTIS as PB-244 494, $1.45. Environmental Protection Agency, Technology Series Report EPA-R2-73-264, August 1973. 230 p, 59 fig, 35 tab, 37 ref. EPA Project 17020 EFB. Contract 14-12-585.

Descriptors: *Waste water treatment, *Adsorption, *Coagulation, Activated carbon, Filtration, Solids contact process, Sludge treatment, Lime, Costs, Dewatering, Pilot plants, *Utah.
Identifiers: *Physical-Chemical treatment, *Powdered carbon, *Carbon regeneration, Alum, Ferric chloride, Sludge thickening, Sludge dewatering, *Salt Lake City (Utah), Combined treatment.

A municipal waste water was treated in a nominal 100 gpm pilot plant by chemical coagulation-precipitation, powdered activated carbon adsorption and granular media filtration. Spent carbon was gravity thickened, vacuum filter dewatered and thermally regenerated in a fluidized bed furnace. Solids-contact units were used for chemical treatment and carbon contacting. Ferric chloride, alum or lime were all found to effectively produce coagulation and phsophorus insolubilization. Based on total treatment costs, including sludge disposal, alum treatment was estimated to be the economic choice for Salt Lake City municipal waste water. Organic removal in the powdered carbon contactors was substantially enhanced by anaerobic biological activity. The use of solids-contact treatment units for carbon contacting resulted in effecting gravity clarification without the use of chemicals. The powdered carbon physical-chemical treatment system produced a treated effluent similar to that expected for biological treatment followed by tertiary treatment for phosphorus removal. Carbon losses of 17 to 60 percent were experienced across the fluidized bed furnace regeneration system. The cause of high carbon losses was identified as ignition of carbon instead of gas which was injected into the fluidized bed to scavenge excess oxygen. (Kreissl-EPA)
W74-00154

PILOT PLANT DEMONSTRATION OF LIME--BIOLOGICAL TREATMENT PHOSPHORUS REMOVAL METHOD,
Kansas State Univ., Manhattan. Dept. of Civil Engineering.
L. Schmid.
Copy available from GPO Sup Doc as EP1.23/2:73-159, $0.85; microfiche from NTIS as PB-224 476, $1.45. Environmental Protection Agency, Technology Series, Report EPA-R2-73-159, June 1973. 48 p, 16 fig, 7 tab, 12 ref. EPA Project 17050 DCC.

Descriptors: *Nutrient removal, *Chemical coagulation, *Biological treatment, Sludge, Municipal waters, *Waste water treatment, Biological oxygen demand, Pilot plants, Instrumentation, Turbidity, *Phosphorus, Lime.
Identifiers: Diurnal flow, Program controller, Respiration rate, Phosphate analyses, *Lime treatment.

A 15,000 gpd pilot plant was constructed to demonstrate the capabilities of a lime treatment process for phosphorus removal. The lime treatment of raw waste water removes the bulk of the phosphorus, and a subsequent biological process removes an additional increment of phosphorus via cell synthesis. The pilot plant used for the study was a package-type, prefabricated unit. Additional small tanks were provided for sludge storage and measurement. A variable speed motor was mated to a program controller to duplicate a diurnal flow pattern through the pilot plant. Lime was introduced into the raw waste water in response to an utomated pH control system. Instrumented systems were also developed for turbidity and ortho-phosphate concentrations in the plant effluent. The raw waste water entering the pilot plant was obtained from the wet well of the Manhattan, Kansas Municipal Plant. Lime treatment of raw waste water to a pH of 9.5 to 10.0 resulted in phosphorus removal of about 80 percent in the primary clarifier. The removal of BOD at this pH level was about 60 percent as compared to 35 percent normally expected in primary settling. The biological activated sludge process following the lime treatment neutralized the primary effluent due to the microbial carbon dioxide production. Aerator pH's were in the neighborhood of 8.0. Lime treatment prior to biological treatment resulted in a change of the settleability of the mixed liquor. Rather high sludge volume indexes were routinely encountered. The process is capable of 90 percent phosphorus removal; however, consistent removal is only assured at the 80 percent level. (EPA)

A PROMISING APPROACH TO SOLVING A STREAM POLLUTION PROBLEM,
Calspan Corp., Buffalo, N.Y.
K. Wang, J. Schwartz, and B. T. Kown.
Technical paper, presented at the 18th Annual Meeting of the Institute of Environmental Sciences, New York, N.Y., May 4, 1972; 15 p, 1 fig, 7 tab, 8 ref.

Descriptors: *Waste water treatment, Water quality, *Water treatment, Filters, *Recycling, Water pollution sources, Pilot plants, Sludge, *Water reuse.
Identifiers: Alum sludge, Jar tests, *Filter backwash water.

The backwash wastewater from a water purification plant has been classified as a potential pollutant and treatment is required before disposal. A promising approach to solving a stream pollution problem is to eliminate such waste discharge completely. The feasibility of direct recycling of filter backwash water was evaluated. The specific objectives were to determine the effects of the backwash recycle on the filter operation and the plant effluent quality. Preliminary laboratory studies were conducted using a series of standard jar tests. A continuous pilot plant of 1440 gal./day capacity was also constructed for a final phase feasibility study. Advantages of direct recycling of filter backwash water are a elimination of a stream pollution problem, the recovery and reuse of filter backwash water for water supply, and an increase in filter operation time. A water filtration plant, with recycling and reuse of its own filter backwash water, would materially reduce the volume of liquid waste. (Calspan)
W74-00164

GLUE TREATMENT-PICK A WAY,
Calspan Corp., Buffalo, N.Y.
L. K. Wang, P. Leonard, J. G. Michalovic, and D. W. Goupil.
Water and Wastes Engineering, Vol 10, No 9, p E20-E25, September 1973, 4 fig, 3 tab. 86-294.

Descriptors: *Waste water treatment, *Activated carbon, Chemical precipitation, *Chromium, *Recycling, Industrial wastes, Water pollution sources, Sludge, *New York, Industrial water, Water reuse.
Identifiers: *Glue factory wastes.

A typical animal-glue manufacturing plant in New York was selected for investigation. The animal-glue manufacturing procedures, the sources and characteristics of glue factory wastes, and the environmental pollution problems caused by the solid and liquid wastes are reviewed and studied. Four potential waste-treatment schemes which would solve the pollution problem or convert both solid and liqud wastes to useful by-products are also studied or assessed. The treated water can be recycled as industrial water. Chromium in the acid stream of glue factory waste can be recovered by chemical precipitation and incineration. Spent activated carbon can be regenerated for reuse. Organic waste sludge can be converted to powdered activated carbon by a Calspan-developed pyrolysis process. The sludge-generated carbon, in turn, can be used for wastewater treatment. (Calspan)
W74-00165

ESTIMATING REGIONAL WASTEWATER TREATMENT COSTS,
Wisconsin Dept. of Natural Resources, Madison. Water Resources Planning Section.
R. J. Timm, and J. M. Cain.
Presented at: The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 21 p, 2 fig, 2 tab, 9 ref.

Descriptors: *Waste water treatment, *Operating costs, *Estimating, *Pumping plants, Optimization, Computer models, Wisconsin, Systems analysis, Operation and maintenance, Construction costs, Regions, Statistical methods.
Identifiers: Regression equations, Standard deviations.

Regionalized sewage systems can reduce per capita sewage treatment costs providing proper regions are established. A computerized model has been developed to estimate costs of treatment systems for any specified region. Based on recent project costs, regression equations are developed to estimate interceptor and pumping station costs. Results of recently published studies are used to estimate initial construction costs and annual operating and maintenance costs of treatment plants. Standard deviations of all costs are calculated so that both an average cost and a cost confidence can be estimated. The model can be used to optimize costs of any given level of treatment. An example in central Wisconsin is presented to illustrate this use of the model. (Bell-Cornell)

DESIGN OF OPTIMAL SEWERAGE SYSTEMS,
Technion - Israel Inst. of Tech., Haifa.
Y. Argaman, U. Shamir, and E. Spivak.
Journal of the Environmental Engineering Division, American Society fo Civil Engineers, V0l 99, No EE5, Proceedings paper No 10050, p 703-716, October 1973. 3 fig, 7 ref.

Descriptors: *Sewers, *Pipes, *Design, *Costs, *Dynamic programming, Computers, Optimization, Environmental engineering, Sanitary engineering, Waste water disposal, Constraints, Hydraulics, Methodology.
Identifiers: *Cost minimization, Network design, Sewerage networks, Pipe diameter, Pipes layout, Pipe slope.

The costs of sewerage systems constitute a major fraction of the overall cost of wastewater disposal. Thus, substantial sums of money can be saved by improving network design. Current design procedures involve selection of pipe sizes and slopes to ensure adequate capacity for peak flows and adequate scouring velocities at minimum or average flows, analysis of several alternative systems, and selection of the least-cost system. A procedure already developed for optimizing a sewer network is impractical at present due to limitations in computer space and computation time. An alternative, more restrictive, procedure is proposed by which a suboptimal design can be obtained with a reasonable computation effort. This procedure utilizes dynamic programming; its usefulness has been demonstrated for small sewerage networks. Large sewerage systems may be decomposed to smaller subsystems, which are optimized internally, and later recombined to a single optimal network. This work constitutes a step toward the development of a calculation technique by which the selection of the least-cost combination of pipes layout, diameters, and slopes can be made in a single computation procedure. (Bell-Cornell)

PILOT-DEMONSTRATION PROJECT FOR INDUSTRIAL REUSE OF RENOVATED MUNICIPAL WASTEWATER,
Central Contra Costa Sanitary District, Walnut Creek, Calif.
G. A. Horstkotte, Jr.
Copy available from GPO Sup Doc as EP1.23:670-73-064, $1.55; microfiche from NTIS as PB-224 507, $1.45. Environmental Protection Agency, Technology Series Report EPA-670/2-73-064, August 1973. 133 p, 26 fig, 21 tab, 12 ref. EPA Project 17080 FSF.

Descriptors: *Water reuse, *Reclaimed water, Sewage treatment, Tertiary treatment, *Waste water treatment, *Pilot plants, Municipal water, *Cooling towers, *Heat exchangers, Phosphorus, Corrosion, Fouling, Scaling.
Identifiers: Canal water.

Three pilot plant treatment sequences were operated during this study to produce various grades of effluent for subsequent testing as industrial water sources. The testing was conducted in pilot-sized test loops consisting of small cooling towers and heat exchangers. At the same time the renovated waters were tested, Contra Costa Canal water, which is presently used by industry in the study area, was also investigated in a test-loop identical to those used for the renovated water. The study results illustrated that the wastewater investigated can be treated satisfactorily for reuse in industrial applications. Corrosion rates and fouling factors observed with renovated water were equal to or less than found with the canal water. Precipitation of phosphorous was the major source of scale formation while using renovated water for cooling purposes, thus indicating the need for phosphorous removal. (EPA)

RESEARCH ON REVERSE OSMOSIS MEMBRANES FOR PURIFICATION OF WASH WATER AT STERILIZATION (165 DEG F),
General Electric Co., Lynn, Mass.
J. M. Amore, J. F. Enos, and A. B. LaConti.
Available from the National Technical Information Service as PB-222 950, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No. 866, February 1972. 71 p, 14 fig, 14 tab, 5 ref. 14-30-2752.

Descriptors: *Membranes, *Reverse osmosis, *Membrane processes, Permselective membranes, Separation techniques, Semipermeable membranes, *Waste water treatment.
Identifiers: *Sulfonated polyphenylene oxide membranes, Meniscus coating process, Ion exchange membranes, Composite films, Wash water, Synthetic wash water, Breadboard modules.

Reliable techniques were developed for meniscus coating sulfonated polyphenylene oxide membranes (PPO) of IEC ± 1.3 on Celgard 2400 to yield composite films approximately 2 ft long x 1 ft wide. A CHCl3/butanol casting solvent was identified that yielded reproducible composite films with a sulfonated PPO membrane thickness of 0.05 to 0.1 mil. Reverse osmosis (RO) performance of the composite films was essentially equivalent to results achieved with knife-cast films of the same IEC. Aerospace-configured gasketed plate and frame RO hardware was designed and fabricated. The breadboard units employed thin channel labyrinth flow and series connected feed channels. A unique 'composite gasket' screen configuration was developed that minimized probability of internal leakage during 165 deg F steady state operation. Parametric life testing at 165 deg F was conducted with 2.5 gpd breadboard units with synthetic and real wash water. Results indicated that a one-pass system with inlet flow of 0.05 gpm may not be feasible because of concentration, polarization and projected fouling problems. The feasibility of developing a viable multipass plate and frame module was investigated. A feed flow rate of 0.15 gpm and average RO pressure of 600 psi were chosen as trade-off design points for life testing. Life tests revealed that at least 3 micron filtration of real wash water is required to minimize fouling (10 to 20%). It was demonstrated that original performance of a fouled membrane in a breadboard module can be essentially restored by treatment under operation with a 165 deg F caustic soap solution. Breadboard modules with 7.5 gpd capability were fabricated and briefly life tested. (OSW)
W74-00316

DEFINITION OF REVERSE OSMOSIS REQUIREMENTS FOR SPACECRAFT WASH WATER RECYCLING,
McDonnell Douglas Astronautics Co.-West, Huntington Beach, Calif.
D. F. Putnam, and G. W. Wells.
Available from the National Technical Information Service as PB-222 943, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No. 861, November 1972. 189 p, 41 fig, 23 tab, 35 ref. 14-30-3062.

Descriptors: *Reverse osmosis, *Membranes, Separation techniques, Membrane processes, Filtration, Permeability, Pressure, *Recycling, *Waste water treatment, Water quality standards.
Identifiers: Wash water, Waste water, *Wash water recovery, Space mission water requirements, Skylab, Multifiltration.

A six-man, reverse osmosis (RO) wash water recovery system that offers the dual advantages of lower equivalent weight and lower cost than competing wash water recovery techniques is defined and evaluated. The system meets the basic requirements of the advanced Skylab, the MDAC six-man modular space station, and the Space Station Prototype (SSP) program. Major design considerations include: Wash water requirements; Compatible cleansing agents; A theoretical estimate of the contaminants found in wash water, projected for the typical astronaut's work and exercise regimen as well as for a typical test subject; A standard procedure for producing used wash water similar to that projected for space vehicles; Wash water and potable water standards suggested by the National Academy of Sciences; A mass balance analysis and computer results that project concentrations of the major chemical contaminants expected in the reverse osmosis feed, product, and brine streams for various water recovery and solute rejection factors; A computerized parametric study of RO module sizing factors; Tradeoff studies comparing reverse osmosis to other methods of wash water recovery; and A detail design specification for a six-man RO unit for wash water recovery in a manned chamber test. ANALYSIS OF ANIMAL WASTE STORAGE AND LAND DISPOSAL SYSTEMS,
Ohio State Univ., Columbus. Dept. of Agricultural Engineering.
R. A. Nordstedt.
PH D Dissertation, 1969. 101 p, 17 fig, 25 tab, 23 ref.

Descriptors: *Farm wastes, Odor, *Waste disposal, *Waste storage, Air pollution, Livestock, *Feed lots, Fertilizers, Nutrients, Nitrates, Effluents, Diffusion, *Mathematical models.
Identifiers: Scheduling model.

Systems which interact with storage and land disposal of farm wastes were analyzed and relevant interfaces and variables were identified. A mathematical model describing storage of wastes and their timely disposal on agriculture land was developed and tested. Odor nuisance potential of farm wastes spread on land was also deliniated. A scheduling model was developed. It could be an effective tool in the design and operation of waste storage and land disposal systems. The model takes into account all important system variables. The waste storage facility was the most significant investment, based on results of the scheduling study. Nutrient effectiveness as afunction of time and land availability were significant. The pattern of the latter was a critical factor in determining minimum storage capacity. (Frantz-East Central)

WATER POLLUTION BY SWINE PRODUCTION OPERATIONS,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering.
J. W. D. Robbins.
PH D Dissertion 1970. 440 p, 51 fig, 48 tab, 57 ref.

Descriptors: Effluents, Waste disposal, Hydrographs, *Hogs, *North Carolina, Nutrients, *Lagoons, Soils, Runoff, Influent, Bacteria, Surface waters, *Water pollution, Drainage, Streams, *Farm wastes, Hydrologic systems, Sampling, Biochemical oxygen demand, Nitrogen, Phosphates, Biodegradation.
Identifiers: Organic carbon.

Seven swine production operations, three using lagoons, one direct discharge, two land disposal, and one control watershed were studied to determine the extent of effluent contribution to stream pollution. Data were collected to determine the effluent strength to be discharged into streams. An analysis was made for more than 1000 effluent and stream samples. An organic carbon analysis was successful in determining strengths of wastes and waste waters. The biochemical oxygen demand (BOD) total organic carbon (TOC) ratio provided an indication of the ease of biodegradation and/or the degree of stabilization. It was found that anaerobic lagoons are not satisfactory as the sole means of treating hog wastes. Direct discharge of wastes into water creates gross pollution and should be prohibited. Land disposal was the superior method for protecting water quality. Slope, degree of erosion, and drainage patterns are the important factors in determining the quality of streams draining agricultural basins. (Frantz-East Central)

ENGINEERING AGRICULTURAL WASTES,
Kentucky Univ., Lexington. Dept. of Agricultural Engineering.
B. J. Barfield, H. E. Hamilton, and I. J. Ross.
In: Quality of the Environment, Socio-Economic, Biological and Engineering Aspects, Papers presented at the College of Agriculture Annual Conference, University of Kentucky, January 5-7, 1971. p 14-21 (1971), 3 fig.

Descriptors: Dehydration, Land use, Proteins, Erosion, Technology, *Waste disposal, Lagoons, Kentucky, Insecticides, Odor, Livestock, Oxidation lagoons, *Farm wastes, *Air pollution, *Water pollution, *Soil contamination.
Identifiers: Composting, Microbial disposal.

The extension of cities into farming areas, demands for more uniform quality products, increased farm production and increasing demands

for processed foods are among recent trends causing problems for agricultural waste management. Soil erosion accounts for approximately 88% and livestock wastes for 11% of all agricultural pollution. But the amount of livestock waste that must be handled by mass management methods is expected to double by 1980. Soil disposal and microbial disposal media are most common while composting and dehydration are also used. All agriculture waste problems must be met with technological, social, and economical acceptability. (Frantz-East Central)
W74-00397

COSTS FOR LARGE SCALE CONTINUOUS PYROLYSIS OF SOLID WASTES,
Texas Tech Univ., Lubbock. Dept. of Chemical Engineering.
H. W. Parker, C. J. Albus, Jr., and G. L. Smith.
Paper 43 b-rv, presented at the 74th National Meeting, American Institute of Chemical Engineers, New Orleans, March 12, 1973. 5 fig, 4 tab, 17 ref.

Descriptors: *Solid wastes, *Costs, Cattle, Feedlots, Waste disposal, *Recycling, Electricity, *Farm wastes, Gases, Fuels, Fertilizers, *By-products, Sodium chloride, Pollution abatement.
Identifiers: *Pyrolysis, Municipal wastes, *Retort, Char.

Conceptual process designs which utilize the recently developed TTU retort to pyrolyze 2,000 tons per day of either municipal solid waste or cattle feedlot waste are reported. The major product of these processes is the production of 30 megawatts of electricity. A governmental entity which could finance the required 15 million dollar investment with 6 per cent bonds over a 20 year period would have to charge users $1.70 per ton of municipal refuse processed or $0.70 per ton of feedlot waste pyrolyzed. (East Central)
W74-00404

CONTINUOUS SOLID WASTE RETORT - FEASIBILITY STUDY,
Texas Tech Univ., Lubbock. Dept. of Chemical Engineering.
J. R. Massie, Jr., and H. W. Parker.
Paper No 43a presented to the 74th National Meeting of the American Institute of Chemical Engineers, New Orleans, March 12-15, 1973; 31 p, 12 fig, 6 ref.

Descriptors: *Cattle, *Farm wastes, *Waste disposal, Recycling, *Solid wastes, Oxidation, Temperature, Energy, By-products, Economics, Texas, Air pollution, Water pollution, Drying.
Identifiers: *Pyrolysis, *Refuse retort, Municipal refuse, Agricultural crop wastes, Char product, Fuel.

Continuous pyrolysis of a solid waste, cattle manure containing 30% moisture, was demonstrated in a six inch diameter retort at a mass flow rate of 136 lb/hr ft2. The retort was an open cylinder with a grate at the bottom. Cyclic injection of oxygen containing and oxygen free gas served to limit the heated zone of the retort to its midsection, which contained no mechanical parts. Maximum temperatures in the hot zone were controlled by mixing oxygen free gas with the injected air. This retort may also be used for municipal refuse, agricultural crop waste, or natural resources such as oil shale and coal. When integrated into a process, energy and by-products can be recovered from the retort as justified by economics, also air and water pollution problems can be easily controlled. (East Central)
W74-00405

CONVERSION OF URBAN REFUSE TO OIL,
Bureau of Mines, Pittsburgh, Pa. Pittsburgh Energy Research Center.
H. R. Appell, I. Wender, and R. D. Miller.
Bureau of Mines Solid Waste Program, Technical Progress Report-25, May 1970. 5 p, 3 tab.

Descriptors: *Recycling, Temperature, *Sewage sludge, *Oil, Water, Gas, Steam, Sulfur, Organic matter, *Fuels.
Identifiers: Processing, Furnace, *Urban refuse, Cellulosic wastes, Carbon monoxide, *Conversion.

Urban refuse, cellulosic wastes, and sewage sludge have been converted to heavy oil by heating under pressure with carbon monoxide and steam. Conversions of the organic matter to oil, water, and gas have averaged near 90 percent at temperatures of 250 deg to 400 deg C and pressures of 1,500 to 5,000 psi. The yield of oil, based on the dry organic matter of the waste materials, is usually near 40 percent. This is the equivalent of more than 2 barrels of oil per ton of dry, ash-free waste material. The oil from urban refuse and cellulosic wastes has a sulfur content near 0.1 percent. This low sulfur content makes the oil from refuse a desirable source of fuel oil. (East Central)
W74-00406

COUMAPHOS AS A FEED ADDITIVE FOR THE CONTROL OF HOUSE FLY LARVAE IN COW MANURE,
Agricultural Research Service, Beltsville, Md.
R. W. Miller, C. H. Gordon, N. O. Morgan, M. C. Bowman, and M. Beroza.
Journal of Economic Entomology, Vol 63, No 3, p 853-855, June 1970. 3 tab, 14 ref.

Descriptors: *Feeds, *Additives, *Cattle, *Farm wastes, Dairy industry, *Mortality, Milk, *Insecticides, Larvae.
Identifiers: *Coumaphos, *House flies, Musca domestica L.

The mortality of first-stage larvae of the house fly, Musca domestica L., seeded into the manure of dairy cows consuming O-144 ppm coumaphos in their ration increased as the concentration of coumaphos in the ration was increased. At the 144 ppm level, larval mortality approached 100%. Although coumaphos residues were found in the feces no residues (<0.002 ppm) appeared in the milk of cows at any level of coumaphos fed. Neither feed intake nor milk production was affected by the feeding of coumaphos. The blood cholinesterase of 1 cow fed 150 ppm coumaphos over a 6-week period dropped to 20% of pre-experimental levels. (East Central)
W74-00411

A RECYCLED FEED SOURCE FROM AEROBICALLY PROCESSED SWINE WASTES,
Illinois Univ., Urbana. Dept. of Agricultural Engineering.
D. L. Day, and B. G. Harmon.
Paper No 72-954 presented at 1972 Winter Meeting, American Society of Agricultural Engineers, Chicago, Illinois, December 11-15, 1972. 10 p, 5 fig, 7 tab, 21 ref.

Descriptors: *Recycling, *Feeds, *Swine, *Farm wastes, Aerobic conditions, Water, Nutrients, *Oxidation lagoons, Proteins.
Identifiers: Odor control, Rats, *Waste management.

An intriguing amount of protein was noticed in swine oxidation ditch mixed liquor at the University of Illinois in 1967. Studies have been in progress since then to measure the nutritive value of the aerobically processed product and use it as a feed supplement in feeding trials to rats and hogs. Several methods of concentrating and feeding the product have been tried. Utilizing th s product provides a source of water and nutrients for swine while minimizing environmental pollutants (air, water, soil). There is odor control and little if any effluent from the building. The results have been very favorable and economics appear competitive with other methods of waste management with a high degree of pollution control. (East Central)
W74-00412

NEW FEEDLOT CONCEPT USES CONVERTED MANURE AS FEED,
T. Zurowski.
Feedlot Management, Vol 15, No 8, p 26, Aug. 1973. 1 fig.

Descriptors: *Recycling, *Farm wastes, *Cattle, *Feed lots, *Nutrients, *Feeds, Economics, Bacteria.
Identifiers: *Refeeding, Cowmel, Farm Ecology Company, Food and Drug Administration, *Cowdominium.

A Washington operation, Farm Ecology, has made plans for a cowdominium. This is a feed storage and a waste conversion plant. There the wastes are subjected to heat, pressure and either acidic or alkaline chemicals. The recycled product, Cowmel, is a highly nutritious and finely ground pellet. Economic feasibility and FDA approval is presently uncertain. (Frantz-East Central)

A COMPARISON OF THREE SYSTEMS FOR TRANSPORT AND TREATMENT OF SWINE MANURE,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
H. L. Person, J. R. Miner, T. E. Hazen, and A. R. Mann.
Paper No 72-439 presented at the 1972 Annual Meeting, American Society of Agricultural Engineers, Hot Springs, Arkansas, June 27-30, 1972. 30 p, 2 tab, 8 fig, 6 ref.

Descriptors: *Hogs, *Waste treatment, *Farm wastes, Feed lots, Iowa, Aerated lagoons, *Oxidation lagoons, Effluent, Nutrients, Bacteria, Fungi, Slime, Odor, Pumping, Maintenance, Water quality.
Identifiers: *Waste transport, Waste management systems, Rotating biological contactor, Flushing gutter, Hydraulic cleaning.

Four engineers have demonstrated and evaluated three systems for hydraulic transportation and disposal of manure. The aeration basin, lagoon aeration basin, and rotating biological contactor systems all successfully used treated effluent as a cleaning medium in swine farro ing and finishing build ngs. Aeration basins treated liquid manure. Pumping was done economically and excess water proved virtually odorless. The process didn't add significantly to either water pollution or animal health problems. Systems and equipment are described in detail. (Frantz-East Central)

HIGH-TEMPERATURE, HIGH-PRESSURE EXTRUSION OF CHICKEN EXCRETA,
Kentucky Univ., Lexington. Dept. of Agricultural Engineering.
F. A. Payne, I. J. Ross, H. E. Hamilton, and J. D. Fox.
Paper No. 72-450 presented at the 1972 Annual Meeting, American Society of Agricultural Engineers, Hot Springs, Arkansas, June 27-30, 1972, 22 p, 6 fig, 1 tab, 17 ref.

Descriptors: *Farm wastes, *Poultry, *Waste treatment, *Recycling, *Temperature, *Pressure, Moisture content.
Identifiers: *Extrusion, Thermal destruction, Uric acid, Chemical changes, Physical changes, Sterilization, Flash volitalization, Microbial organisms.

Chicken excreta and an excreta-feed mixture were extruded at a temperature range of 250-300F. for periods of 8.6 to 21.4 seconds. Pressures of 300 to

600 psi were utilized with the high temperatures to aid in microbial destruction. An analysis includes chemical and physical changes in the extended material. Also given is an equation which can be used to predict microbial destruction. When extruded, chicken manure (which normally contains disease organisms) may become a versatile, low-cost, and highly productive food material. (Frantz-East Central)

HUMAN AND ANIMAL WASTES AS FERTILIZERS,
Metropolitan Sanitary District of Greater Chicago, Ill.
J. R. Peterson, T. M. McCalla, and G. E. Smith.
In: Fertilizer Technology and Use, 2nd edition, Soil Science Society of America, p 557-596, 1971. 8 fig, 27 tab, 42 ref.

Descriptors: *Farm wastes, *Sewage, *Waste disposal, Irrigation, Nitrates, Soil profiles, Lagoons, Pathogenic bacteria, *Fertilizers, *Water pollution, *Soil contamination, Odor, Leaching, Chemical properties, Physical properties, Microbial composition, Crops, Toxicity.
Identifiers: *Human wastes, Plant yields, Digested sludge.

Solid waste from municipal wastewater treatment plants in the United States is analyzed quantitatively and qualitively. If properly digested, the sludge has little odor and is relatively free of pathogens. The use of digested sludge to ameliorate spoils has been proven. Three years' use of digested sludge on corn land has resulted in increased grain yields with no visual toxic symptoms to the plants. Qualitative and quantitative studies were also made on animal wastes. Although most pathogens are generally destroyed in the holding of wastes, weed infestations may be a problem with the application of animal waste to soil. Specific instances of waste utilization for soil improvement are cited for various states. (Wetherill-East Central)
W74-00419

CONTINUED RECYCLING OF CATTLE MANURE,
California Univ., Davis.
C. L. Ferrell, and W. N. Garrett.
Proceedings, Western Section, American Society of Animal Science, Vol 24, p 415-419, 1973. 5 tab, 5 ref.

Descriptors: *Cattle, *Farm wastes, *Recycling, Nitrogen, Calcium, Nutrient requirements, *Waste disposal, California.
Identifiers: Ration, Digestion stalls, Forced-air ovens, Digestibility.

Four Hereford steers were confined in digestion stalls and fed the basal ration at a maintenance level. Their manure and urine were recycled in forced air ovens at 100C. for 48 hours. The recycled wastes were mixed 50:50 with the basal ration. Resulting wastes were similarly treated and mixed, digested, then recycled again. The less digestible components of the feces increased while digestible components decreased substantially during each recycling. Less energy was digested in subsequent refeeding. Mineral and nitrogen content increased with each recycling, resulting in the only significant nutritional value of manure after recycling. (Frantz-East Central)
W74-00424

ELECTRIC IN-HOUSE DRYING OF POULTRY WASTE,
Cornell Univ., Ithaca, N.Y. Dept. of Agricultural Engineering.
D. R. Price, A. T. Sobel, and H. R. Davis.
Paper No 72-806 presented at the 1972 Winter Meeting of the American Society of Agricultural Engineers, Chicago, Illinois, December 11-15, 1972. 12 p, 9 fig, 3 tab.

Descriptors: *Poultry, Odor, Nutrients, *Recycling, *Farm wastes, Physical properties, Moisture, Fertilizers, *Waste disposal, New York, *Drying.
Identifiers: In-house drying, High-rise poultry house, Circulating fans, Exhaust fans, Drying costs.

Forced air over manure removes water continuously in a high rise poultry house designed to house 30,000 caged birds. The drying process removes one-half of the wastes' total weight and reduces odor by minimizing bacterial activity. The dried manure is spread only once a year, thus recycling nutrients through cropland. Design figures for a high-rise poultry house and operation costs for the drying system are included. (Frantz-East Central)
W74-00426

EFFECTS OF SWINE LAGOON EFFLUENT ON THE SOIL AND PLANT TISSUE,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
C. V. Booram, T. E. Hazen, and L. R. Frederick.
Paper No 73-239 presented at 1973 Annual Meeting, American Society of Agricultural Engineers, University of Kentucky, Lexington, Kentucky, June 17-20 1973. 19 p, 17 tab, 1 fig, 16 ref.

Descriptors: *Hogs, Cattle, Iowa, *Farm wastes, Confinement pens, *Lagoons, Anaerobic conditions, *Effluents, *Nutrients, Electrical conductance, Salts, *Waste disposal, *Irrigation, *Toxicity, *Water pollution, Corn (Field), *Soil contamination, Water quality.
Identifiers: Clarion-Webster soil, Tile-drained grass plots, Plant tissues.

Twelve 40 x 60 foot tile drained plots of Clarion-Webster soil were given applications of anaerobic lagoon effluent. The soil received 0, 3.7, 11.3, and 22.6 inches of effluent per season. There were no significant plant population differences at the 0.10 level. Corn tissues were analyzed for 14 nutrients. (N,P,K,Mg,Ca, Na,Si,Mn,Fe,Cu,Zn,Al,Sr, and Mo). In the tissue analysis P, Na, Fe and Al increased while Mg content decreased with increasing applications of effluent. After 4 years of anaerobic lagoon effluent applications the electrial conductivity of the soil showed little change. (Frantz-East Central)
W74-00428

RECOVERY OF ANIMAL FEED FROM CATTLE MANURE,
Agricultural Research Service, Peoria, Ill. Northern Marketing and Nutrition Research Div.
R. W. Jones, J. H. Sloneker, and G. E. Inglett.
In: Proceedings 18th Annual Institute of Environmental Sciences, (1971). p 267-269, 3 tab, 17 ref.

Descriptors: *Recycling, *Farm wastes, *Cattle, *Feed lots, Waste disposal, Amino acids, Proteins, Filtration, Centrifugation, Illinois.
Identifiers: Fractionating.

In the United States over 10 million tons of high grade protein are produced annually in cattle manure. Separating useful feed from fecal waste has become a valuable process which lowers feed costs and aids in waste disposal. Four methods for fractionating manure to remove undesirable constituents to produce high-protein feed supplement are described. Manure may be refined to remove the residue fraction, yielding a soluble fraction and a feed fraction that contains 64% of the original nitrogen. The feed fraction is higher in amino acid content than corn or wheat. The average steer annually produces $34 to $59 worth of feed fraction. Feed savings alone could be used to properly dispose of less usable waste fractions. (Frantz-East Central)
W74-00429

PERIODICITY OF THE BLUE-GREEN ALGAE AND THEIR EFFECT ON THE EFFICIENCY OF MANURE-DISPOSAL LAGOONS,
Agricultural Research Service, Washington, D.C. Agricultural Engineering Research Div.
H. J. Eby, and V. P. Singh.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Price $0.15. Production Research Report No 142, April, 1972. 8 p, 2 fig, 2 tab.

Descriptors: *Recycling, Nutrients, Waste water, *Lagoons, *Algae, Bacteria, *Sewage, Oxidation, Climatic zones, Proteins, Farm wastes, *Waste water treatment, *Nutrient removal, *Cyanophyta.
Identifiers: *India, Waste disposal lagoons, Seasonal growth.

This research provided a starting point for expanding feed production and aiding in the biological purification of waste water. Research in India revealed that blue-green algae have self-limiting tendencies and may be used advantageously. Since growth periods in the species vary, scientists might possibly anticipate each specie's population peaks thereby controlling algae growth. Harvesting of algae serves two purposes: (1) to remove organic matter thus preventing it from becoming a pollutant, and (2) to serve as potential livestock and poultry feed. (Frantz-East Central)
W74-00430

METHODS FOR IMPROVEMENT OF TRICKLING FILTER PLANT PERFORMANCE. PART I. MECHANICAL AND BIOLOGICAL OPTIMA,
North Carolina Univ., Chapel Hill. Wastewater Research Center.
James C. Brown, L. W. Little, D. E. Francisco, and J. C. Lamb.
Copy available from GPO Sup Doc as EP1.23:670-73-047a, $2.30; microfiche from NTIS as PB-224 787, $1.45. Environmental Protection Agency, Technology Series Report EPA-670/2-73-047a, August 1973. 235 p, 37 fig, 28 tab, 58 ref. EPA Project 11010 DGA, Contract 14-12-505.

Descriptors: *Waste water treatment, *Trickling filters, *Performance, Optimization, *Operations, *Pilot plants, Filtration, Biochemical oxygen demand, Treatment facilities.
Identifiers: *Hydraulic surface loading, Nitrogenous oxygen demand.

The Chapel Hill high rate trickling filter plant which consists of two parallel and equal lines of treatment units was operated in parallel as two separate plants over a period of 26 months. Each side was operated with various fractions of influent flow and recirculation flow rates. Statistical analysis of operating results indicated that the common mathematical models are not reliable in predicting daily performance at the Chapel Hill plant. They are, however, useful in predicting long term average performance. Recirculation ratios as high as 3.0 proved beneficial at total hydraulic loadings of less than 20 mgad. Operation above this loading is not currently feasible at Chapel Hill. The hydraulic surface loading of the final settling tanks was found to have a significant effect on overall plant performance. A surface loading of 500 gpd/sq ft is recommended for the design of final tanks in new plants. Pilot plant studies using 4-foot diameter rock filters indicate a significant advantage for two-stage filtration even though the hydraulic loading on each stage may be double that for single-stage operation. Pilot plant studies of activated sludge treatment of trickling filter effluents were conducted. The process proved effective in improving removal of BOD, if effective final solids removal facilities are provided. The process also proved effective in reducing nitrogenous oxygen demand. (EPA)

REPORT TO THE GOVERNOR AND THE INTERIM FINANCE COMMITTEE: ALTERNATIVE RECOMMENDATION, LAS VEGAS WASH/BAY POLLUTION ABATEMENT PROJECT.
Clark County Board of County Comissioners, Nev.

September, 1973. 7 p, 2 fig.

Descriptors: *Waste water treatment, *Pollution abatement, *Nevada, Water reuse, Colorado River.
Identifiers: *Waste water reclamation, *Las Vegas (Nev).

Pursuant to Nevada statute recognizing Clark County as the instrument of government responsible for development and implementation of a pollution abatement plan for the Las Vegas Wash-Lake Mead area, the Board of County Commissioners recommends that an alternative be developed for the plan proposed by the Las Vegas Valley Water District. Reclamation of wastewater, in-valley irrigation, power and industrial uses, and possible future groundwater recharge will be emphasized in the forthcoming recommended plan, whereas export of wastewater was emphasized by the Water District's earlier plan. Selected staff, contractual rights, and obligations of the Las Vegas Valley Water District have been transferred to Clark County in order to insure orderly transfer of pollution abatement project responsibility. A program outline developing and recommending water standards, evaluating methods and costs of meeting those standards, and developing uses for reclaimed wastewater, 'Advanced Wastewater Treatment of Effluents from the City of Las Vegas and Clark County Sanitation District Wastewater Treatment Plants,' has been prepared. The County Commissioners have indicated an intent to plan, design, and construct facilities necessary to implement the wastewater management plan with consultation from Burrows, Smith and Company of Salt Lake City. Committees will be established to explore possible contracts with the Nevada Power Company or others wishing to acquire secondary water rights and to determine community desires for recreational use of Las Vegas Wash. A timetable for pollution abatement project actions from July, 1973 through July, 1974 is presented. (Stein-North Carolina)

WATER QUALITY PROGRAM FOR OAHU WITH SPECIAL EMPHASIS ON WASTE DISPOSAL: FINAL REPORT.
Engineering-Science, Inc., Honolulu, Hawaii; Dillingham Environmental Co., Honolulu, Hawaii; and Sunn, Low, Tom and Hara, Inc., Honolulu, Hawaii.

Prepared for City and County of Honolulu, Department of Public Works, February, 1972. 336 p, 36 fig, 89 tab, 35 ref.

Descriptors: *Waste water disposal, *Waste water treatment, *Hawaii, *Oahu, *Honolulu, Sewage disposal, Runoff, Water reuse, *Water quality standards, Oceanography, Costs, Financing.
Identifiers: Waste loads.

A consortium of three firms allocated components of this detailed wastewater disposal study among themselves. Wastewater generation on Oahu in 1972 was estimated to be 109 mgd and is projected to increase to about 265 mgd by 2020 due to population increases. About half the 1970 discharge received no treatment, resulting in deterioration of water quality. Special emphasis is given to wastewater disposal problems in Mamala Bay (off Honolulu's Sand Island treatment plant). Pearl Harbor, and Kaneohe Bay. Water quality objectives set by the State Water Quality Standards were reviewed and quantified when appropriate. The design of water quality control systems is directed toward conservation of corals and other aquatic organisms, protection of aesthetic qualities, and protection of recreational uses of waters. Two fundamental objectives are minimization of deleterious discharges and minimization of concentrations of deleterious discharges which cannot be avoided. Advanced primary treatment and discharge via a 300-feet-deep ocean outfall was recommended for the Sand Island treatment facility. Secondary treatment and reuse of water for sugar cane irrigation was recommended for the Pearl Harbor area. Upgrading of existing facilities and discharge via a deep ocean outfall off Mokapu point was recommended at Kaneohe Bay. Recommendations are made for wastewater collection, treatment, and disposal in other wastewater systems. Construction costs of $277 million current dollars and a 50-year phasing program are considered. Specific recommendations are made for future studies. (Stein-North Carolina)

5E. Ultimate Disposal of Wastes

COST-EFFECTIVENESS ANALYSIS OF DISPOSAL SYSTEMS,
M. L. Popovich, L. Duckstein, and C. C. Kisiel.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 99, No EE5, Proceedings paper No 10104, p 577-591, October 1973. 2 tab, 25 ref.

Descriptors: *Waste disposal, *Water pollution, *Environmental engineering, *Solid wastes, *Incineration, *Alternative planning, Groundwater, Natural resources, Byproducts, Utilities, Evaluation, Decision making, Systems analysis, *Arizona.
Identifiers: *Cost-effectiveness, *Tucson (Ariz), Sanitary landfill, Sensitivity analysis.

A technique is proposed for evaluating alternative waste disposal methods in order to choose the one that will best meet a community's requirements. Using Kazanowski's standardized cost-effectiveness methodology, alternative systems are compared for effectively disposing 4 lbs to 5 lbs of municipal refuse per person per day in urban communities of the United States. The criteria for studying this problem are often limited to cost or marketable measures; in contrast, use of a cost-effectiveness approach allows the inclusion of nonquantifiable measures of effectiveness such as public acceptance, political factors, health risks, environmental constraints, soil benefits, and potential groundwater pollution. Data from a case study in Tucson, Arizona are used to illustrate the problem and methodology. The use of sensitivity analysis for evaluating uncertain factors is discussed. The three main areas of uncertainty in the application of the methodology are: (1) Determination of goals; (2) identification of criteria; and (3) determination of the capabilities of each alternative system in terms of the criteria chosen. 5F. Water Treatment and Quality Alteration

SELECTIVE DESTRUCTION OF BACTERIA,
R. R. Meyers.
U. S. Patent No. 3,753,886, 3 p, 3 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 913, No 3, p 945, August 21, 1973.

Descriptors: *Patents, *Waste water treatment, Liquid wastes, *Bacteria, Electricity, *Water purification, Water quality control, Treatment, *Water treatment, *Electrolysis.

This water purification treatment consists of selective killing of certain bacteria. The liquid is deposited within a container and an approximately 60 c.p.s. alternating electrical current of 2-8 amperes at 7-28 volts is passed through the liquid. The muscles of the bacteria are vibrated until death results. With the use of alternating current, no metal hydroxide is produced at least at 60 c.p.s. or higher. (Sinha-OEIS)

TASTE THRESHOLDS OF HALOGENS IN WATER,
Environmental Protection Agency, Boston, Mass.
P. Bryan, L. Kuzminski, F. Sawyer, and T. H. Feng.
Journal of American Water Works Association, Vol 65, No 5, p 363-368, May 1973. 3 fig, 2 tab, 32 ref.

Descriptors: *Taste, *Water quality, *Water analysis, *Halogens, Bromine, Chlorine, Iodine, Chlorination, Laboratory tests, Measurement, Testing procedures, Disinfection, Water purification, Chemical properties, Potable water, Consumptive use.

The group of chemical compounds referred to as the halogens are effective water disinfecting agents, but when applied in sufficient concentration, they may lend an unpleasant taste and odor to water supplies. Perception of taste is a very individualized characteristic among humans, with some persons able to detect much smaller concentrations of chemicals than other people can notice. The tests described used a panel of eleven persons of both sexes and ranging in age from their early twenties to their mid-fifties. The testing consisted of tasting three samples of water, one of which contained a known concentration of the halogen compound and the other two were reagent water which had been distilled, demineralized and deodorized. The test results indicated that with chlorine residuals, taste threshold values varied quite significantly with pH, while for bromine and iodine there was no significant variation at different pH levels. MUNICIPAL DESALTING STUDIES FOR SELECTED KANSAS COMMUNITIES,
Wilson and Co., Salina, Kans.
R. E. Crawford, R. P. Selm, G. D. Starrett, and C. A. Roberts.
Available from the National Technical Information Service as PB-222 942, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No 869, March 1973. 209 p. 14-30-2738.

Descriptors: *Desalination, *Water reuse, Economics, Cost analysis, *Kansas, *Water softening, Brackish water, Potable water, Water treatment.

This is a summary report of municipal desalting studies for selected Kansas communities and a waste water reuse study utilizing desalting processes for Wichita, Kansas. The report includes a preliminary engineering and economic assessment of the feasibility and cost of applying various desalting techniques to improve the quality of potable water at Arkansas City, Damar, Girard, Hillsboro, Larned, Potwin, Towanda and a regional plan which included Potwin and Towanda. Total treatment systems were analyzed including optimization of pretreatment systems (sequestration, lime treatment, and lime-soda softening); application of six desalting techniques; and utilization of subsurface injection of brines (a Kansas regulatory requirement). Special consideration was given to protecting process equipment and subsurface brine receiving formations against calcium sulfate precipitation. The total treatment costs include supply, pretreatment, desalting, brine disposal, and delivered water facilities and ranged from a low of 47.2 cents/kgal to supply a peak demand of 5.0 MGD at Arkansas City to a high of 685.5 cents/kgal to supply a peak demand of 0.1 MGD at Damar. A special study was made at Wichita, Kansas wherein waste water from the City's secondary treatment facilities was returned for reuse after additional treatment which included lime treatment, ammonia stripping, filtration, carbon adsorption, chlorination, 30-day detention and desalting at a cost of 80.9 cents/kgal for a continuous demand of 10-20 MGD. FABRICATION AND TESTING OF TUBULAR REVERSE OSMOSIS MODULES CONTAINING ULTRATHIN MEMBRANES FOR WET-DRY CYCLING OPERATIONS,
North Star Research and Development Inst., Minneapolis, Minn.
J. E. Cadotte, K. E. Cobian, and L. T. Rozelle.
Available from the National Technical Information Service as PB-223 137, $1.45 in microfiche. Office of Saline Water Research and Development Progress Report No. 874, June 1973. 25 p, 2 fig, 6 tab, 5 ref. 14-30-2883.

Descriptors: *Membranes, *Reverse osmosis, *Permeability, Separation techniques, Membrane processes, Brackish water, Thin films, Water purification, Water quality, Water treatment.
Identifiers: Ultrathin membranes, Cellulose acetate, Tubular membranes, Porous substrate.

The objective was to apply ultrathin reverse osmosis membranes to wet-dry cycling conditions with acceptable reverse osmosis performance. In the first phase the composite system of ultrathin cellulose acetate membranes on microporous polysulfone support films in 1/2-inch fiber glass tubes was shown to meet the specifications provided by the U.S. Army Mobility Equipment Research and Development Command. However, the adhesion of the ultrathin membrane to the polysulfone support was not strong enough to withstand high turbulence during filling of the modules. The objective of the second phase was to find a proper adhesive system for this composite membrane system to resist extreme flushing conditions while maintaining adequate flux, rejection, and wet-dry properties. An adhesive system including glyoxal in the Reten solution and 2,4 diamino-6-phenyl-s-trizaine (DPT) in the polysulfone liner was developed that looked promising in two-foot tubes. However, DPT was detrimental to the membrane in five-foot tubes (for the modules). It was found at the end of the program that DPT could be eliminated in another procedure used for producing a wet-dry membrane. After flushing tests in flat cells the membrane composites exhibited fluxes of 36 to 42 gfd and rejections of 91 to 94 percent (600 psi, 0.5 percent NaCl, and 25 deg C). (OSW)
W74-00313

FILTRABILITY OF WATER-TREATMENT-PLANT SLUDGE,
Auburn Univ., Ala. Dept. of Civil Engineering.
R. W. Glenn, J. F. Judkins, Jr., and J. M. Morgan.
Journal American Water Works Association, Vol 65, No 6, p 414-417, June 1973. 3 fig, 24 ref. OWRR A-024-ALA (4).

Descriptors: *Water treatment, Sludge, *Filtration, *Sludge treatment, Sulfates, Waste water treatment, *Coagulation.
Identifiers: *Alum sludge, Aluminum sulfate.

The use of aluminum sulfate (alum) as a coagulant for treating surface-water supplies was introduced in 1884. Since that time, the disposal of filter-backwash wastes and coagulant sludges has, in most cases, been accomplished by direct discharge to receiving streams. Under current guidelines, however, the sludge must be treated as a concentrated pollutant. The filtration possibilities of alum and some interesting new observations are discussed.
W74-00387

ON THE PROBLEM OF EMERGENCY-SUPPLY WITH DRINKING-WATER BY WAY OF SEITZ--FILTER, (IN GERMAN),
Mainz Univ. (West Germany). Hygiene Institut.
A. Hechmat.
Zentralbl Bakteriol Parasitnekd Infektionskr Hyg Erste Abt Orig Reihe B Hyg Praev Med. Vol 155, No 5/6, p 535-540. 1972. (English summary).

Identifiers: Bacteria, *Bacterio phage, *Filters, Phage, Poliovirus, *Seitz filters, *Potable water, *Water treatment, Germany.

Among the different germ-tight filters, which have come into use for the production of solutions free of bacteria, the Seitz-degerminating-layers have attained special interest. They gained their special position by means of the absorbing capacity of the asbestos-layers. The question how to procure drinking-water out of polluted water in case of need and catastrophies by way of Seitz-filters could not be answered sufficiently. The usability of the Seitz-degermination layer for the production of drinking-water in flood-disasters and inundations was tested; the water of the Rhine was taken for the tests. The differeing receptivity of the filters for the Newcastle-virus, T3-phage and the polio-virus, type II, seems to depend on the size of the virus and not on their concentration in the water. The break-through of the virus suspended in the Rhine water probably takes place sooner than of the virus bloated in springwater. Taking in account an appropriate safety-surplus a load on a Seitz-EKS-I filter for the emergency-supply with drinking-water up to a macimum of 10 1 waste-water or 2500 1 river water per cm2 is recommended. In practice these numbers are of little validity, since such a filter is already stopped up with 0.5 1 river-water per cm2. EKS-layers are undoubtedly permeable to virus, but the delay in this permeability is long enough to produce--in case of need a microbiologically faultless drinking water.--Copyright 1973, Biological Abstracts, Inc.

NITRATE AND NITRITE VOLATILIZATION BY MICROORGANISMS IN LABORATORY EXPERIMENTS,
Pennsylvania State Univ., University Park. Dept. of Agronomy.
J.-M. Bollag.
Copy available from GPO Sup Doc as EP1.23:660-73-002, $1.00; microfiche from NTIS as PB-224 467, $1.45. Environmental Protection Agency, Technology Series, Report EPA-660/2-73-002, August 1973. 65 p, 8 fig, 13 tab, 33 ref. EPA Project 16080 EIT.

Descriptors: *Denitrification, *Nitrates, *Nitrites, *Nitrogen cycle, *Soil microorganisms, Bacteria, Fungi, Microbial cultures, Nitrogen, Nitrous oxide, Environmental effects, Microorganisms, Water pollution control.
Identifiers: Optimizing denitrification, Nitrate-volatilizing microorganisms.

Microbial nitrate and nitrite volatilization was considered as a means to eliminate nitrogen from soil and water in order to inhibit the accumulation of nitrogenous substances as pollutants or health hazardous compounds. Therefore it was attempted to compare nitrate reducing microorganisms in their reactions to different environmental conditions in laboratory experiments. Changing oxygen concentration, pH, temperature, nitrate or nitrite concentration affected differently the denitrification process of various isolated microorganisms. Unfavorable growth conditions led to the accumulation of nitrite if nitrate served as substrate. It was found that certain soil fungi are also capable of volatilizing nitrogen as nitrous oxide. Biological and chemical factors were evaluated during nitrite transformation in autoclaved and non-autoclaved soil by determination of the evolvement of nitrogenous gases. During chemical nitrite volatilization, which occurred essentially at a low pH, the major gases evolved were nitric oxide and nitrogen dioxide, but if biological activity was predominant in a neutral and alkaline environment, nitrous oxide and molecular nitrogen were formed. The validity of laboratory observations in relation to field studies in the domain of denitrification is discussed and evaluated. (EPA)

STUDIES IN SWEDEN ON FEASIBILITY OF SOME METHODS FOR RESTORATION OF MERCURY-CONTAMINATED BODIES OF WATER,
Swedish Water and Air Pollution Research Lab., Stockholm.
A. Jernelov, and H. Lann.
Environmental Science and Technology, Vol 7, No 8, p 712-718, August 1973. 6 fig, 3 tab, 28 ref.

Descriptors: *Mercury, *Dredging, *Chemical precipitation, Bioassay, Fish, Sulfides, Hydrogen ion concentration, Path of pollutants, Absorption, Heavy metals, Water pollution effects, Sediments, Laboratory tests, On-site investigations, Lakes, Rivers, Turbidity, Binders.
Identifiers: *Methylation , *Mobilization, Bioaccumulation, Biotransformation, Lucioperca lucioperca, Biological samples, *Sweden, Covering, Lake Trummen, Lake Mellanfryken, Lake Garlangen, Hallsfjarden Bay, Morrumsan River, Removal.

Brief descriptions are given of laboratory experiments which were conducted to investigate ways of removing mercury from water or of preventing its transformation into forms which accumulate in fish. Dredging, which stirs and suspends the sediment, may increase mercury methylation. Drainage water from dredge spoils also may contain high concentrations of mercury. However, it may be possible to precipitate this mercury out of drainage water. Addition of sulfide ion converted divalent inorganic mercury to mercury sulfide and reduced the methylation rate of mercury as shown by tests in which mercury accumulations in fish were studied. Covering mercury deposits with mercury-binding or with inert material may reduce methylation rates, but the presence of benthic organisms, currents, and other disturbing influences may contribute to the mixing process thereby eliminating beneficial effects. Raising the pH of the water which favors production of dimethyl mercury, reduced the amount of mercury accumulated by fish. Field studies were made of five areas in Sweden, Lakes Trummen, Garlangen, Mellanfryken, Hallsfjarden Bay, and Morrumsan River, which had undergone various types of treatments similar to those investigated in the laboratory tests. The results from some of the methods are promising and warrant further investigation. (Little-Battelle)

POLLUTION SKIMMER,
B. J. Hoffman.
U. S. Patent No. 3,753,497, 3 p, 3 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 913, No 3, p 859, August 21, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Skimming, Separation techniques, *Pollution abatement, Equipment, Water pollution control, Water quality control.

The base of this skimmer contains a central drain and several troughs which extend outward from it. The troughs are skewed relative to radii to aid in the formation of a vortex within the drain. The base is supported by several lateral wings each having a density less than that of the liquid. A drain tube is connected to the lower end of the drain and after passing through a pump, discharges the matter into a surface material receptacle which is a multiple outlet container for separating immiscible liquids. A V-shaped weir surrounds the base and wings for use in flowing liquids. The skimmer, weir and a pump may be mechanically connected so all may float as a unit. (Sinha-OEIS)
W74-00084

CONVERGING VORTEX APPARATUS FOR SEPARATING OIL FROM WATER,
E. A. Boyd.
U. S. Patent No. 3,753,496, 4 p, 6 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 913, No 3, p 859, August 21, 1973.

Descriptors: *Patents, Oil spills, *Oil pollution, *Pollution abatement, *Separation techniques, Water pollution control, Water quality control, Equipment, *Skimming.

This apparatus includes a vortex generator with means to induce rotary motion in fluids flowing through the generator. The generator is maintained in submerged position with its upper end near the water surface in close proximity to an oil slick. The oily water or film is sucked into the generator and then directed through the equipment to a remote reservoir where separation takes place. Screens are provided to filter the water and oil mixture as it is being drawn into the apparatus. The screens may be formed of 1/4 inch expanded metal to screen out large foreign objects which might affect the operation. The apparatus is supported by a triangular arrangement of spherical floats or buoys rigidly secured by a triangular frame. The apparatus is maintained in a stable operating position with the horizontal plane of its vanes parallel to the surface of the water. The

floats are spaced to permit a free, undistrubed flow of water and oil. When being used in conjuction with a support ship or barge, the casing can be suspended by suitable lines from a ship-mounted boom. An operator aboard ship manually manipulates a hoist line to maintain the casing at the desired level relative to the water line. Sinha-OEIS)
W74-00085

SEPARATING APPARATUS,
V. S. Aiello, J. P. Albanese, R. V. Anderson, and F. Platt.
U. S. Patent No. 3, 753, 492, 5 p, 8 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 913, No 3, p 858, August 21, 1973.

Descriptors: *Patents, *Separation techniques, *Oil spills, Equipment, *Oil pollution, Water pollution control, *Pollution abatement, Water quality control.

Separation of oil and water is accomplished by directing the water with a layer of oil floating on it into a vertical cylindrical tank extending above and below the liquid surface. At the bottom of the tank, an impeller maintains the liquid in rotation about a vertical axis, creating a vortex. The oil appears in the vortex as a layer of maximum thickness at the center. A float having a contour symmetrical about a vertical axis centers itself in the vortex. The float carries an outlet pipe for the oil whose open lower end is submerged in the liquid at the center of the vortex. The outlet pipe is preferably rigid, its top connects to a flexible pipe section which may move laterally by small amounts so as to allow the float to follow lateral movements of the vortex. The pipe is also vertically extendable, so as to adjust to changes in the liquid level with respect to the sides of the tank. The apparatus may be mounted on a twin hulled vessel and propelled through the water to remove an oil slick. The inlet for the oil and water mixture is at the bow end of the tank, with the water outlet at the stern. (Sinha-OEIS)
W74-00086

APPARATUS FOR REMOVING OIL FROM OIL-CONTAMINATED WATER,
J. Cincotta.
U. S. Patent No. 3,752,762, 2 p, 2 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 913, No 2, p 654, August 14, 1973.

Descriptors: *Patents, *Oil pollution, Oil spills, *Oily water, *Filtration, *Pollution abatement, Water pollution control, Water quality control, *Industrial wastes, Liquid wastes, Separation techniques.
Identifiers: *Pumice stones.

Pumice stones are placed in a container having an open top, a removable bottom and porous opposed first and second side walls. Oil contaminated water is directed through the first porous side wall, through the container and out the second side wall. The pumice stones in the container absorb the oil from the water, and when they become saturated the bottom of the container is removed allowing the pumice stones to drop on a conveyor. The conveyor transports them to a steam-cleaning area. After being cleaned they are returned to be used again. (Sinha-OEIS)
W74-00087

METHOD FOR CONTROLLING ALGAE POLLUTION,
Kettering Scientific Research, Inc., Yellow Springs, Ohio. (Assignee)
R. W. Treharne, and T. E. Brown.
U. S. Patent No. 3,752, 747, 4 p, 2 fig, 2 tab, 11 ref; Official Gazette of the United States Patent Office, Vol 913, No 2, p 651, August 14, 1973.

Descriptors: *Patents, Eutrophication, *Electrolysis, *Bacteria, Algae, *Algal control, Water pollution control, Water quality control, *Pollution abatement, Azotobacter, E. coli.
Identifiers: Chromatium, R. rubrum.

The water is subjected to electrolysis with electrochemically inert electrodes or with an electrochemically active anode and an electrochemically inert cathode to destroy or to control the growth of algae. Most forms of algae are destroyed by impressing, per liter of water, about 15 volts and 150 milliamperes of electric potential between the electrodes over a 72 hour period. When an active anode is used it releases metal ions toxic to algae, and a detector electrode is used to sense the toxic ion concentration so that a predetermined concentration lethal to algae is maintained without rising to a level of being toxic to fish or humans. This system may be used for the destruction of E. coli, R. rubrum, Chromatium, Azotobacter, and other bacteria. (Sinha-OEIS)
W74-00088

OIL RECOVERY VESSEL,
Oil Recovery Systems, Inc., Mineola, N.Y. (Assignee)
E. E. Lithen.
U.S. Patent No. 3,752,317, 4 p, 4 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 913, No 2, p 547, August 14, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, Water pollution control, *Pollution abatement, Water quality control, Equipment.
Identifiers: *Scoops.

The vessel's hull has a scoop projecting forward for collecting a mixture of oil and water from the surface of the body of water. The scoop is pivotally mounted and is vertically movable to compensate for sea conditions and changes in the waterline of the vessel. Fluid collected under the action of gravity and the forward motion of the vessel is directed through conduits into submerged separation tanks under conditions of laminar flow. After decanting, a pumping device causes removal of the collected oil. The oil is then transferred to storage tanks and the water is discharged. (Sinha-OEIS)
W74-00089

FLOATING OIL CONTAINMENT BOOM,
Murphy-Pacific Marine Salvage Co., New York. Merritt Div. (Assignee)
R. K. Thurman.
U. S. Patent No. 3,751,925, 3 p, 3 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 913, No 2, p 447, August 14, 1973.

Descriptors: *Patents, Equipment, *Oil spills, *Oil pollution, *Pollution abatement, Water pollution control, Separation techniques, Water quality control.
Identifiers: *Booms.

This floating oil containment boom comprises floating units connected by flexible joints. Each unit consists of a rigid, flat barrier provided with a metal drum for supporting it in a vertical position in a body of water with part extending above the water surface and part submerged. Secured between adjacent units are flexible panels preferably made of waterproof textile material, which may extend below the barriers to register with flexible curtains of the same material attached to the bottoms of the barriers and weighted to keep them flat. Each unit is secured to strong lines which carry the stresses applied in towing or heavy seas and the leading unit in tow may be provided with a bow plane or like element to facilitate towing an assembly of units to or from a working location. REGIONAL PERSPECTIVES,
Tennessee Valley Authority, Chattanooga.
A. J. Wagner.
In: The Nation's Environment--Problems and Action, p 19-30, 1971. East Tennessee State University, Johnson City.

Descriptors: *Planning, Water pollution control, *Soil contamination, *Alternative planning, Long-term planning, Future planning (Projected), Economic efficiency, *Regional development.
Identifiers: *Tennessee Valley.

The shift from an agrarian society to an industrialized one has caused man to lose touch with true quality in life. A major cause of this situation is the multiplicity of environmental ills associated with the age of technology. Technology itself, however, is not so much the villain as is what man has done with his technology. If nature is seen as an integrated system, with irrevocable relationships between air, water and land, then the problems of the environment can be seen in total perspective and a regional approach to planning becomes feasible. The Tennessee Valley is cited and discussed as a good example of how such a perspective can and does work--particularly in such nominally unrelated areas as garbage disposal, rural renovation, water and air pollution control and thermal pollution control. NATIONAL LIVESTOCK WASTE MANAGEMENT PROGRAM,
Agricultural Research Service, Beltsville, Md.
R. G. Yeck.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 5-10, November 29-30, 1972.

Descriptors: *Farm wastes, *Feed lots, Groundwater, *Recycling, *Livestock, Air pollution, Water pollution, Soil contamination, Runoff, Waste disposal, *Waste treatment, Odor.

Identifiers: Livestock waste management research.

Farm waste research project areas are discussed in an overview. Some areas of research receive adequate concentration while other topics such as recycling farm wastes, are inadequately considered. Projects include those seeking to control feedlot runoff and odor due to land applications of farm wastes. Researchers are urged to cooperate and to work concurrently on related projects to prevent land, air, and water pollution. Recent cuts into research allocations necessitate increased teamwork. W74-00126

REGIONAL LIVESTOCK WASTE MANAGEMENT PROGRAM,
Nebraska Univ., Lincoln. Agricultural Experiment Station.
R. W. Kleis.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska. p 11-15, November 29-30, 1972, 1 tab.

Descriptors: *Research and development, *Livestock, *Farm wastes, *Management, Air pollution, Water pollution, Waste treatment, Waste storage, *Waste disposal, Recycling, Nitrogen, Nutrients, Confinement pens, *Regional development.

Livestock waste management projects and objectives are listed for state agricultural experiment stations. The primary purpose is to enhance the total effectiveness of all participating agencies and institutions while preventing unnecessary duplication. Present efforts have been building up, as have problems of waste management, for fifteen years. Needed are projections of not only economic costs, but also of social and environmental costs. (See also W74-00125) (Frantz-East Central)
W74-00127

POLLUTION OF AIR, WATER, AND SOIL BY LIVESTOCK,
Agricultural Research Service, Lincoln, Nebr.
L. F. Elliott.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 23-28, November 29-30, 1972, 28 ref.

Descriptors: *Air pollution, *Water pollution, *Soil contamination, *Farm wastes, Feed lots, Odor, Surface waters, Groundwater, *Livestock, Spectroscopy, Chromatography, Nitrates, Oxidation, Soil profiles, Nebraska, Kansas.

Air, water, and soil pollution research projects are discussed. Air pollution studies include attempts at developing compounds which can reliably indicate odors. While surface water pollution from feedlots is no longer deemed a major problem, research has been necessary for the prevention of soil pollution and groundwater pollution at feedlot sites. Sealants in holding ponds and debris basins and management practices for land application of feedlot wastes are also being studied. (See also W74-00125) (Frantz-East Central)
W74-00128

APPLICATION, UTILIZATION AND DISPOSAL OF LIVESTOCK WASTE,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
H. Wittmuss.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 31-35, November 29-30, 1972.

Descriptors: *Waste disposal, *Waste treatment, *Farm wastes, *Livestock, *Feed lots, Runoff, Irrigation, Nitrates, Nebraska, Kansas, North Dakota.
Identifiers: Mounding.

Livestock waste disposal from unpaved, beef cattle feed lots has the greatest pollution potential. Separation of liquid and solid wastes is important. Separated liquids have been applied to cropped land at up to 36 inches a year for two years without problems, however, long range effects of effluent application need further study. Likewise needed is the determination of the highest sustained rates at which solid wastes may be applied without soil deterioration and salinization. Mounding sometimes aids in denitrifying wastes. Other waste management systems used with varying degrees of success are: (1) drying entire waste, (2) incineration, (3) composting, (4) refeeding, (5) protein production, (6) building blocks, (7) raw material for oil, and (8) methane production. (See also W74-00125) (Frantz-East Central)
W74-00129

DESIGN AND MANAGEMENT OF RUNOFF CONTROL SYSTEMS,
Agricultural Research Service, Lincoln, Neb.
J. A. Nienaber.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 39-43, November 29-30, 1972, 18 ref.

Descriptors: *Farm wastes, *Feed lots, Cattle, Runoff, Drainage, Flumes, Terracing, Nebraska, *Management, *Waste treatment, Waste disposal.
Identifiers: *Runoff control system, Debris basin, Holding pond, Disposal area.

A runoff control system has been successfully operated on two 1000 head feedlots. Designed from the University of Nebraska Field Laboratory, the system consists of three components: debris basin, holding pond, and controlled disposal area. This system was proven superior to the one-pond system for liquid and solid wastes. Broad basin terraces may be beneficial in flood protection as well as in runoff control. Shallow debris basins are recommended for minimizing waste odors. Wooden dams with crushed rock release runoff from debris basins. The suggested disposal area is from one half up to the full size of the feedlot itself. Rainfall, slope length, and size of operation are among factors which affect runoff control design. Alternative runoff control systems and their relative costs are discussed. (See also W74-00125) (Frantz-East Central)
W74-00130

CHARACTERISTICS OF ANIMAL WASTES AND RUNOFF,
Agricultural Research Service, Lincoln, Neb.
J. R. Ellis.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 49-53, November 29-30, 1972, 29 ref.

Descriptors: Conductivity, *Farm wastes, Runoff, Thermal properties, Nutrients, Nitrates, Phosphorus, Ammonia, Pathogenic bacteria, Water pollution, *Physical properties, *Chemical properties, *Biological properties, Animal parasites, Amino acids, Waste disposal.
Identifiers: Pollution potential, Waste management, *Animal wastes runoff.

Chemical, physical, and biological properties of farm waste must be further studied to correctly determine the pollution and management problems they present. The pollution potential discharged into streams requires chemical analysis of farm wastes, while design of runoff control structures lends itself to determination of physical properties. Further research is likewise needed in assessing life of microorganisms in feces and in runoff control systems. Because comparatively little information has been established regarding the physical properties of farm waste, further research is suggested in characterizing feces, urine, and housed feed lot wastes, especially regarding gross energy, freezing point, and thermoconductivity. (See also W74-00125) (Frantz-East Central)
W74-00131

WASTE MANAGEMENT AND ANIMAL PERFORMANCE,
Nebraska Univ., Lincoln. Dept. of Animal Science.
S. Farlin.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 57-59, November 29-30, 1972, 5 ref.

Descriptors: *Feed lots, *Farm wastes, *Waste treatment, Nutrition, Nebraska, Missouri, Iowa, Minnesota, *Management.
Identifiers: Gains, Animal performance, Mounding, Cold/warm slot housing.

Increasing animal performance, hence profits, depends upon feed lot modifications such as mounding wastes in winter and decreasing cattle density. Also, cattle with access to sheltered lots generally show increased gains, higher grade carcasses, and higher dressing percentages than cattle in open lots. Additional research may be the key to making more accurate estimates on the effects of housing and waste management on returns from feeding cattle. (See also W74-00125) (Frantz-East Central)
W74-00132

EDUCATION, ACTION AND REGULATORY PROBLEMS OF ANIMAL WASTE MANAGEMENT,
Nebraska Univ., Lincoln.
E. A. Olson.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 63-66, November 29-30, 1972.

Descriptors: Nebraska, *Economics, Oxidation lagoons, *Waste disposal, Ventilation, *Farm wastes, Odor, *Feed lots, Cattle, Hogs, Inlets (Waterways).
Identifiers: *Voluntary waste control, *Regulatory waste control.

Problems associated with shifting from voluntary waste control to regulations adopted by the Environment Control Council are outlined. Inspections of feed lots and investigations of existing waste management systems are in progress. Also outlined is the educational program (including economic factors) coordinated by county extension agents, consulting engineers and the Department of Environmental Control. Maintenance of present systems and future research needs are discussed in outline form. (See also W74-00125) (Frantz-East Central)
W74-00133

PROBLEMS OF ANIMAL WASTE MANAGEMENT FROM THE LIVESTOCK FEEDER VIEWPOINT,
Nebraska Livestock Feeders Association, Fairmont. Environmental Management Committee.
W. Krejci.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 69-71, November 29-30, 1972.

Descriptors: *Feed lots, *Farm wastes, Runoff, Odor, *Cattle, *Hogs, Lagoons, Surface waters, Nebraska, Air pollution, *Legal aspects.

Livestock feeders have sacrificed some of their freedom for the improvement of the environment. Arguments and recommendations are considered from the feeders' viewpoint. Filtering runoff through fields is a suggested alternative to concentration of runoff into holding ponds. Also, swine wastes should be as much in governmental focus as are cattle waste problems. More extensive data will be required to control some feed lot runoff problems, but proper management and further governmental and educational cooperation will aid feeders. (See also W74-00125) (Frantz-East Central)
W74-00134

POLLUTION OF AIR, WATER AND SOIL BY LIVESTOCK,
Agricultural Research Service, Lincoln, Nebr.
T. M. McCalla, and G. E. Schuman.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 75-79, November 29-30, 1972.

Descriptors: *Air pollution, *Water pollution, *Soil contamination, *Feed lots, Odor, Runoff, Waste storage, Waste treatment, Waste disposal, Livestock, *Farm wastes, Nitrates, Groundwater.
Identifiers: Abandoned feedlot reclamation.

Although researchers have solved many problems, they have uncovered many areas which require further research. A standard method for defining odorous compounds is needed. More reliable maintenance and sealants are needed to prevent seepage into ground water. Experiments in land disposal should be carried out for at least ten years. (See also W74-00125) (Frantz-East Central)
W74-00135

APPLICATION, UTILIZATION AND DISPOSAL OF LIVESTOCK WASTES,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
O. E. Cross.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 83-89, November 29-30, 1972, 14 ref.

Descriptors: *Farm wastes, *Feed lots, *Waste disposal, *Recycling, Water pollution, *Application methods, Irrigation, Soil management, Physical properties, Chemical properties, Runoff, Groundwater, Effluents, Nitrates, Centrifugation, Conductivity, Phytotoxicity, Cattle, Hens, Turkeys.
Identifiers: Micronutrients.

Research plans for fourteen projects are given. Research objectives and problems to be faced are discussed. Current problems include waste management, waste utilization, runoff control systems, effluent disposal and effects of disposal on agricultural land. (See also W74-00125) (Frantz-East Central)
W74-00136

RESEARCH NEEDS FOR THE DESIGN AND MANAGEMENT OF BEEF FEEDLOT RUNOFF CONTROL SYSTEMS,
Agricultural Research Service, Lincoln, Nebr.
N. P. Swanson.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 93-97, November 29-30, 1972, 4 ref.

Descriptors: *Feed lot, *Waste disposal, Nebraska, *Farm wastes, Pollutants, *Cattle, Gravity, Irrigation, Runoff, Effluents, Infiltration, *Waste management.
Identifiers: Buffer strips, Field disposal, *Waste runoff control.

Current research projects should partially resolve feed lot runoff problems, but the goal is set for 'zero pollution.' New plans and objectives for overland flow, buffer strips, feed lot floor design and topographical research are discussed. These methods require proof of environmental acceptability. Proper distribution of effluent is of major concern to the Soil Conservation Service. Odor, because of nuisance suits, may be the greatest runoff problem. The facilities of the University of Nebraska Field Laboratory and Meat Animal Research Center is aiding research in several runoff control areas. (See also W74-00125) (Frantz-East Central)
W74-00137

CHARACTERISTICS OF LIVESTOCK WASTE AND RUNOFF,
Agricultural Research Service, Lincoln, Nebr.
C. B. Gilbertson.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 101-103, November 29-30, 1972, 29 ref.

Descriptors: *Farm wastes, *Physical properties, *Chemical properties, *Feed lots, Coliforms, Pathogenic bacteria, Lagoons, Management, *Waste disposal, Degradation, Runoff, Cattle, Water pollution sources, *Waste treatment.
Identifiers: Catonic nutrients, Mounding, Microbial properties.

Defining physical, chemical and microbial characteristics is basic to current and future farm waste disposal and runoff control. Three projects are discussed whose aims are determining physical and chemical properties in relation to the mechanics of waste disposal. Approximately three years will be required to complete needed research in these areas. (See also W74-00125) (Frantz-East Central)
W74-00138

WASTE-INDUCED PROBLEMS OF HOUSED LIVESTOCK,
Agricultural Research Service, Clay Center, Nebr. Meat Animal Research Center.
T. E. Bond.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 107-110, November 29-30, 1972, 1 tab.

Descriptors: *Livestock, *Sheep, *Cattle, *Hogs, Nebraska, Recycling, Pollutants, Odor, Waste disposal, *Confinement pens, *Feed lots, Nutrients, Oxidation, *Waste treatment, Transportation.
Identifiers: *Housed confinement.

Although farm waste problems are in great need of research, livestock confinement provides numerous advantages: greater mechanization of chores, animal protection, and potentially increased production. Specific problems related to waste collection, treatment, transportation and disposal are listed in order of priority: odors, nutrient or chemical control or adjustment, treatment for reduction, land disposal, re-use, and system selection. Housed livestock research facilities at the Meat Animal Research Center are described and possible research suggestions are listed. (See also W74-00125) (Frantz-East Central)
W74-00139

OTHER RESEARCH NEEDS,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
W. E. Splinter.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 113-114, November 29-30, 1972.

Descriptors: *Farm wastes, Proteins, Runoff, *Feed lots, *Waste disposal, *Recycling, Confinement pens, Aquatic animals, Hogs, Cattle, Filters, Nebraska.
Identifiers: *Paunch manure, Horses.

Alternate methods of recycling cattle manure, the use of grass as a runoff filter, and the treatment and disposal of swine, horse and aquatic wastes should further be explored. (See also W74-00125) (Frantz-East Central)
W74-00140

REGIONAL ADMINISTRATOR'S SUMMARY,
Agricultural Research Service, Peoria, Ill. North Central Region.
T. B. Kinney, Jr.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 117-119, November 29-30, 1972.

Descriptors: *Farm wastes, *Research priorities, *Coordination, *State governments, *Federal government, *Local governments, Administration, Waste treatment.

The regional administrator encourages research efficiency by increased cooperation among state, federal and industrial groups. Research priorities must be justly established and sound research must be carried out on high priority problems. (See also W74-00125) (Frantz-East Central)
W74-00141

AREA DIRECTOR'S SUMMARY,
Agricultural Research Service, Clay Center, Nebr. Meat Animal Research Center.
K. E. Gregory.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 125-126, November 29-30, 1972.

Descriptors: *Farm wastes, *Management, *Feed lots, *Research priorities, Expenditures, Costs.

High priority problems call for specific research approaches. Shortage of funds necessitates consolidation of some programs and reduction of others. Resources should be budgeted for efficient research at all locations. (See also W74-00125) (Frantz-East Central)
W74-00143

CONCLUDING COMMENTS,
Nebraska Univ., Lincoln. Agricultural Experiment Station.
H. W. Ottoson.
In: Proceedings: Livestock Waste Management Research Review, Nebraska Center for Continuing Education, Lincoln, Nebraska, p 127-129, November 29-30, 1972.

Descriptors: *Farm wastes, Crop production, *Livestock, Soils, Marketing, *Waste disposal, Odor, *Feed lots, Confinement pens, Nebraska, *Waste treatment.

The livestock waste management conference was a success. The conference was a bench mark inventory on which research in livestock waste mangement may be planned in the future. (See also W74-00125) (Frantz-East Central)
W74-00144

RELIABILITY OF URBAN WATER QUALITY MANAGEMENT,
Texas A and M Univ., College Station. Dept. of Industrial Engineering.
C. S. Shich, J. K. Garner, and G. L. Curry.
Presented at: The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 27 p, 8 fig, 5 tab, 17 ref.

Descriptors: *Water quality, *Management, *Reliability, Water pollution control, Treatment facilities, *Optimization, Regions, Operating costs, Probability, Decision making, Economics, Mathematical models, Systems analysis, *Texas.
Identifiers: *Urban water, *Cost minimization, Chance-constrained quadratic programming, *Parametric analysis, *San Antonio River Basin (Tex), Managerial goals, Sensitivity analysis.

In the reduction of the liability of pollution to urban water resources, the probabilistic nature of the performance of pollution control facilities and environmental responses must not be ignored. Reliability is defined as the measure of effectiveness for the attainment of water quality managerial goals. An optimization model is developed for the determination of the best pollution control policies for each treatment facility in terms of the minimization of total regional cost requirements, the quality control requirements, and the reliability desired. A chance-constrained quadratic programming technique coupled with parametric analysis is utilized as the basic solution approach. A practical problem based on the situation existing in the San Antonio River Basin Region of Texas has been used to illustrate application of the technique. The implications resulting from a sensitivity analysis of this model are discussed. (Bell-Cornell)

SURVEY OF POTENTIAL VECTORS OF YELLOW FEVER IN TANZANIA, (IN FRENCH),
Office de la Recherche Scientifique et Technique Outre-Mer, Bondy (France). Services Scientifiques Centraux.
J. Mouchet.
Bull W H O. Vol 46, No 5, p 675-684. 1972. Illus. (English summary).
Identifiers: *Aedes control, DDT, Dieldrin, Organic compounds, Phosphorus, Survey, *Tanzania, *Vectors (Yellow fever).

A survey was made in Nov.-Dec., 1969, in the central and western parts of Tanzania. This is the start of the rainy season, although rains had not begun in most of the woodland steppe areas. Towns and villages (41) in the woodland steppe, woodland savanna, Lake Victoria shores, highlands and intermediate regions were surveyed. The density of Aedes aegypti was evaluated in terms of the house index, the container index and the Breteau index; there is no standard index for Ae. simpsoni. No breeding of Ae. aegypti in drinking water was observed. It was found breeding mainly in outside containers and tree-holes; its seasonal fluctuation follows the rainfall pattern. Thus, the negative results recorded in the woodland steppe where the rains had not begun cannot be considered definite proof of the absence of this mosquito. The indices of density were generally low, they varied greatly from place to place, even in similar ecological conditions. The only color form of Ae. aegypti found was the black one (formosus). Larvae of Ae. simpsoni were plentiful in and near the villages. They were frequently as abundant as those of Ae. aegypti in their natural breeding sites. Thus, in the areas studied, Ae. simpsoni is a periodomestic and a feral species. The other potential vectors were seldom encountered; this is not surprising since the survey was biased toward towns and villages. Larvae of Ae. stokesi, Ae. schwetzi, Ae. marshalli and those of several species of Culex and Toxorhynchites brevipalpis were among the culicine larvae collected. Eight Tanzanian strains of Ae. aegypti were colonized in the laboratory and tested for susceptibility to various insecticides. Three strains (those from Tanga, Dar es Salaam, and the Pugu forest) were resistant to dieldrin; all of them were susceptible to DDT and organophosphorus compounds.--Copyright 1973, Biological Abstracts, Inc.

ENZYMATIC REMOVAL OF OIL SLICKS,
Oklahoma State Univ., Stillwater. Dept of Biochemistry.
R. K. Gholson, and P. E. Guire.
Available from the National Technical Information Service as AD-757 071, $3.00 in paper copy, $1.45 in microfiche. Final Report, March 4, 1973. 14 p, 7 ref, append. Project No 137-876/6-3-70 (Code 443). Contract No N00014-71-A-0004-0001.

Descriptors: *Oil spills, *Enzymes, Toxicity, Daphnia, Oil pollution, Emulsifiers, Yeasts, Microbial degradation, Organic compounds.
Identifiers: *Oil removal, Cleanup, Candida petrophilum, Pseudomonas aeruginosa, Hexadecane.

A procedure to modify enzymes chemically in order to cause them to adhere to a hydrocarbon-water interface without appreciable loss of enzymatic activity has been developed. So far this procedure has only been applied to 'model' enzymes (muramidase, ribonuclease and 2 lipases); however, it is hoped that it can also be successfully used with purified microbial hydrocarbon oxidizing enzymes when they become available. Partial purification and characterization of extracellular emulsifying factors, produced by microorganisms (Candida petrophilum and Pseudomonas aeruginosa) during their growth on hydrocarbons was also accomplished. These factors are potentially useful in clean up of oil spills by providing an easily biodegradable non-toxic detergent. Preliminary toxicity tests with the water flea (Daphnia magna) have indicated an LD sub 50 concentration after 48 hours exposure, of 40 percent for the yeast culture supernatant and 8 percent for the Pseudomonas culture supernatant. (Little-Battelle)

CAPITAL AND OPERATING COSTS OF POLLUTION CONTROL EQUIPMENT MODULES, VOLUME I, USER GUIDE,
ICARUS Corp., Silver Spring, Md.
H. G. Blecker, and T. W. Cadman.
Copy available from GPO Sup Doc as EP1.23/3:73-023a, $2.40; microfiche from NTIS as PB-224 535, $1.45. Environmental Protection Agency, Socioeconomic Studies Series, Report, EPA-R5-73-023a, July 1973. 255 p, 4 fig, 51 tab, 4 ref. EPA Project 21AQJ. 68-01-0717.

Descriptors: *Cost analysis, *Costs, *Pollution abatement, Cost comparisons, Economics, Annual costs, Construction costs, *Operating costs, Estimated costs, Manuals, *Engineers estimates, *Capital costs, Water pollution control.

The User's Guide describes the scope of the cost manual on installation and operation of pollution control equipment modules. Illustrative examples are given enabling the user to prepare estimates of conceptual environmental protection processes using the companion Data Manual. Emphasis is placed upon the determination of the installed and annual costs of individual process equipment modules, determination of the installed and annual process costs, and evaluation of the portential process profitability in those cases where profit is a motive. (See also W74-00308) (Abel-EPA)

THE POLITICS OF WATER POLLUTION,
Connecticut Univ., Storrs. Inst. of Water Resources.
D. M. Fox.
Completion Report, 1973, 15 p. OWRR A-046-CONN (1). OWRR 14-31-0001-3507.

Descriptors: *Political aspects, *Water pollution control, *Decision making, Water policy, Pollution abatement, Federal Government, State Governments, *Connecticut, Agriculture, Industries, Legal aspects, State jurisdiction, Legislation.
Identifiers: Interest groups, Federal grants, Questionnaires, Connecticut Water Resources Commission, Connecticut Clean Waters Act of 1967.

A majority of the commissioners on the Water Resources Commission (WRC) of Connecticut, in existence from 1957 to 1971, represented, directly or indirectly, interests which pollute, including agriculture, municipal government, and industry. These commissioners, rather than representatives of ecological groups, dominated WRC decisions. Case studies of two polluters - the City of New Haven and the Scovill Corporation of Waterbury, lead to the following conclusions: (1) efforts to end pollution have been delayed by the slowness of the WRC in reviewing abatement plans, (2) the failure of the Federal government to fund pollution abate-

ment grants at levels originally promised have slowed down or stopped abatement. A great deal has been done under the 1967 Connecticut Clean Waters Act to reduce pollution. However, the composition of the WRC, the failure of the state government to fund WRC at levels permitting hiring of additional staff, and the failure of the federal government to fund its contribution at levels originally expected have prevented the full attainment of the goals set forth in the act.

AGRICULTURE AND POLLUTION--SOCIO-ECONOMIC ASPECTS,
Kentucky Univ., Lexington. Coll. of Agriculture.
A. F. Bordeaux, Jr.
In: Quality of the Environment, Socio-Economic, Biological and Engineering Aspects, papers presented at the College of Agriculture Annual Conference, University of Kentucky, January 5-7, 1971. p 1-7 (1971), 6 ref.

Descriptors: *Water pollution, Economics, Surface waters, Technology, *Fertilizers, Conservation, Insecticides, *Farm wastes, Nitrates, Farm prices, Costs, *Waste disposal, Water treatment, DDT, Regulation, Kentucky, Agriculture.

As the interest in environmental protection heightens in the United States, farmers are increasingly criticized as pollutors of air and water. Costs of pollution must be met and farmers, declining in political power, feel the most pressure. Alternative chemicals are available to replace the DDT family, but they are less effective and more expensive. Providing for economical environmental protection requires the cooperative efforts of economists, engineers and scientists. (Frnatz-East Central)

DRAIN INSTALLATION FOR NITRATE REDUCTION,
Southwestern Irrigation Field Station, Brawley.
L. S. Willardson, B. D. Meek, L. E. Grass, G. L. Dickey, and J. W. Bailey.
Paper No. 69-734 presented at the 1969 Winter Meeting American Society of Agricultural Engineers, Chicago, Illinois, December 9-12, 1969. 2 tab, 2 fig.

Descriptors: *California, *Drains, *Installation, *Nitrates, Permeability, Sumps, Irrigation, Electrical conductance, Leaching, Percolation, Groundwater, *Dentrification.
Identifiers: *San Joaquin Valley (Calif), Panoche silty clay.

Because farmers remove more nitrates from the soil than they put into it, denitrification or reducing nitrates to nitrogen gas, is sometimes desirable. A field experiment was installed in California's San Joaquin Valley to test submergence of drains as a means of denitrification. The Panoche silty clay area was irrigated four times during the months of July and August. Samples made of the soil showed that the side of the drain oriented toward the ground water source had the highest reading of nitrate content. This indicated that soil denitrification depends ultimately upon saturation from irrigation as well as sufficient presence of organic carbon matter and a shortage of oxygen. Along with soil denitrification, ground water with high nitrate content was also diluted. (Frantz-East Central)

UTILIZATION OF DIFFERENT LEVELS OF POULTRY LITTER NITROGEN BY SHEEP,
Virginia Polytechnic Inst., Blacksburg. Dept. of Biochemistry and Nutrition; and Virginia Polytechnic Inst., Blacksburg. Dept. of Animal Science.
A. N. Bhattacharya, and J. P. Fontenot.
Journal of Animal Science, Vol 24, p 1174-1178, 1965. 4 tab, 28 ref.

Descriptors: *Sheep, *Nitrogen, Fertilizers, *Protein, Feeds, *Farm wastes, Nutrition, Chemical properties, Samples, *Metabolism, *Recycling.
Identifiers: Digestibility, Nitrogen retention, *Poultry litter, Peanut hulls, Crude protein, Soybean protein.

A series of three metabolism trials were conducted with eight yearling wethers to study the utilization of the nitrogen in auto-claved peanut-hull broiler litter, containing 22.6% crude protein (dry basis). Poultry litter nitrogen replaced approximately 25, 50 and 100% of the nitrogen of a purified ration containing isolated soybean protein as the nitrogen source. Apparent digestibility of crude protein in the rations decreased significantly with each increase in litter nitrogen level above 25%. However, the depression was small when litter supplied 50% of the nitrogen. When litter supplied 25 and 50% of the nitrogen, digestibility of litter crude protein calculated by difference was 67 and 65%, respectively, compared with 71% when only soybean protein was used. Nitrogen retention, expressed as grams per day, percent of nitrogen intake or percent of absorbed nitrogen, was significantly lower at the 100% litter nitrogen level than when no litter was used. There were no consistent differences in ammonia and non protein nitrogen content of rumen fluid and in concentration of various nitrogen fractions in the blood plasma of sheep fed the different rations. (East Central)

DEHYDRATED POULTRY MANURE AS A CRUDE PROTEIN SUPPLEMENT FOR SHEEP,
Agricultural Research Service, Beltsville, Md. Biological Waste Management Lab.
L. W. Smith, C. C. Calvert, and J. R. Menear.
In: Proceedings 1973 Maryland Nutrition Conference for Feed Manufacturers, The University of Maryland, The Maryland Feed Industry Incorporated, and The American Feed Manufacturers Association cooperating, March 15-16, 1973. p 35-44, (1973), 1 fig, 15 tab, 14 ref.

Descriptors: *Farm wastes, *Arsenic, *Sheep, *Nitrogen, *Feeds, Growth, Nutrition, Chemical properties, *Recycling.
Identifiers: Poultry manure supplemented diets, Feed additives, Digestibility, Soybean oil meal.

Despite possible arsenical residues, dehydrated poultry-manure (DPM) supplemented diets were consued by sheep as readily as diets supplemented with soybean oil meal (SBOM). Nitrogen from broiler manure supplemented diets was not significantly less digestible than SBOM nitrogen and was retained in the sheep equally well. The true digestibility of DPM-N was determined to be 81%, a value of similar magnitude determined by others for drymixed conventional feeds. Arsenic from different sources ingested by sheep was detected in all tissues assayed. Withdrawal of arsenic from feed results in a rapid decrease in tissue arsenic concentration. Significance of arsenic in poultry manure processed for ruminant crude protein supplements will depend on individual feeding regimes, arsenic concentration in manure and permissible levels established for lamb and mutton. EFFECT OF BACILLUS THURINGIENSIS IN CATTLE MANURE ON HOUSE FLY LARVAE,
Agricultural Research Service, Beltsville, Md. Animal Science Research.
R. W. Miller, L. G. Pickens, and C. H. Gordon.
Journal of Economic Entomology, Vol 24, No 4, p 902-903, August 1971. 2 tab, 11 ref.

Descriptors: *Cattle, *Farm wastes, Larvae, *Mortality, Additives, Feeds, Poultry.
Identifiers: *Fly control, *Bacillus thuringiensis Berliner, *Musca domestica L., Biotrol BTB-183.

A commercial formulation of Bacillus thuringiensis Berliner, Biotrol BTB 183-25 W, was fed to dairy cattle in an attempt to control house fly, Musca domestica L., larvae in the feces. A maximum larval mortality of 32% was obtained when cows were fed 3200 ppm of this formulation. In an in vitro experiment, complete control of house fly larvae was obtained at a level of 12,800 ppm of feces. (East Central)

TOXICITY TO HOUSE FLIES AND HORN FLIES OF MANURE FROM INSECTICIDE FED CATTLE,
Agricultural Research Service, Kerrville, Tex. Entomology Research Div.
R. O. Drummond.
Journal of Economic Entomology, Vol 56, No 3, p 344-347, June, 1963. 2 tab, 6 ref.

Descriptors: *Toxicity, *Farm wastes, Feed lots, Larvae, *Insecticides.
Identifiers: *House flies (Musca domestica), *Horn flies (Hacmatobia irritans), Bayer 22408, Co-ral, Butonate, Bayer 37342, Famophos, Bayer 37341, Rhodia RP-9895, Dipterex, V-C 13, General Chemical 4072, Bayer 29493, Stauffer R-1504, Chlorinated hydrocarbons.

Insecticides were added to cattle rations in long and short term experiments. In a 91-day test Co-ral and Bayer 22408 proved 100% effective in preventing development of larvae of horn flies and partially effective against house flies in the manure tested. Ten insecticides were used in 10-day tests. Some insecticides were effective against both species, while others were at least partially effective with either or both. (Frantz-East Central)

SOLID WASTE MANAGEMENT.
Metropolitan Council of the Twin Cities Area, Minn.

March, 1970. 24 p, 2 fig.

Descriptors: *Solid wastes, *Water pollution, *Landfills, Planning, Waste disposal, Environmental effects, Water table, Groundwater, *Minnesota.
Identifiers: Policies, Solid waste management, *St. Paul (Minn.), *Minneapolis (Minn.).

This policy plan for solid waste management, one of several interrelated elements of a total development guide for the Twin City metropolitan area, contains three parts: a presentation and discussion of long range policies for solid waste management; a 10 year plan for disposal of solid wastes with emphasis on sanitary landfills; and a short range implementation program. The long range policies cover such issues as disposal methods, the location and accessibility of landfill sites, environmental pollution and relations to water resources, compatibility of disposal sites with adjacent land uses, and the ultimate use of the disposal site for other purposes. With regard to relations to environmental quality and water resources in particular, sanitary landfills are prohibited within 1,000 feet of the normal highwater mark of a lake, pond, or reservoir and within 300 feet of a river or stream; they are prohibited in major groundwater recharge areas and wetlands, and putrescible wastes cannot be deposited within five feet above the highest known level of the water table at a landfill site. (Elfers-North Carolina).

METROPOLITAN COUNCIL FIVE-YEAR CAPITAL IMPROVEMENT PROGRAM FOR SEWERAGE FACILITIES.
Metropolitan Council of the Twin Cities Areas, Minn.

September, 2972. 20 p, 2 tab.

Descriptors: *Sewerage, *Project planning, *Budgeting, *Minnesota, Programs, Projects, Priorities, Financing, Water quality control.
Identifiers: Capital improvements, Public participation, *St. Paul (Minn.), *Minneapolis (Minn.).

This program amends the 1970 Metropolitan Development Guide for sanitary sewers and includes numerous major projects for the collection, treatment, and disposal of wastewater for the period 1972 through 1976, a capital improvements budget for 1972-73, and various new policies and criteria. The program was formulated via well-defined procedures adopted by the Metropolitan Council to assure strong input from local governments and interested citizens. The procedures include public hearings, solicitation of written comments, and public meetings in each of the local sewer service areas. Some of the policies adopted include the new construction of only those projects for which maximum federal and state support is available and the expansion of sewerage capacity only where there is a strong local commitment, unless there are serious metropolitan-wide issues at stake. New criteria for ranking proposed projects were also adopted. Highest priority projects are those to serve areas subject to immediate health hazards, areas where serious pollution is taking place, and areas planned for major urban development within the next five years. (Elfers-North Carolina)

SEWAGE AND WASTE CONTROL RULES AND REGULATIONS FOR THE METROPOLITAN DISPOSAL SYSTEM.
Metropolitan Sewer Board, St. Paul, Minn.

December, 1971. 13 p.

Descriptors: *Sewerage, *Regulation, *Waste water disposal, *Waste water treatment, Waste identification, Inspection, Monitoring, Permits, Penalties, Standards, Septic tanks, Administration, *Minnesota.
Identifiers: *St. Paul (Minn.), *Minneapolis (Minn.).

Rules and regulations have been adopted to provide an efficient and safe operation of the metropolitan wastewater disposal system and to help carry out the comprehensive sanitary sewer plan. The key areas covered by the regulations are new connections to the sewerage system, the nature of allowable discharges into the system, the disposal of septic tank sludge, and the enforcement of the regulations. No connections are allowed to the system without a permit and an inspection. Of particular importance is the determination of the source, quantity, and characteristics of the wastewater load. No connections are allowed to discharge contents from septic tank. Other wastes that are either prohibited or restricted include fats, wax, oils, garbage that has not been ground, radioactive wastes, and any materials that are either highly flammable or noxious. Industrial waste discharges are allowed but the industry must provide access to monitor the nature of the wastes. In addition, if the wastes are high in suspended solids or chemical oxygen demand a surcharge will be levied. (Elfers-North Carolina)

PUBLIC HEALTH CONSEQUENCES OF MASS SWARMING OF BOOPHTHORA ERTHROCEPHALA (DE GEER, 1776) BLACK FLIES IN COUNTY SZOLNOK DURING FLOODS OF 1970,
Szolnok Megyei Kozegeszsegugyi Jarvanyugi Allomas (Hungary).
D. Papay, J. B. Szabo, and I. Tarjanyi.
Parasitol Hung. 4 p 181-188. 1971. (English summary).
Identifiers: Boophthora-Erythrocephala, *Flies (Black), Floods, Human diseases, *Hungary (County Szolnok), Nuvan, *Public health, Swarming, Chemtrol.

The black fly swarm in County Szolnok, Hungary in 1970 caused economic damage, with estimated losses approaching 1.0-1.5 million forints. These black flies, Boophthora erythrocephala, bred in large rivers and streams in Hungary. A total of 2600 persons received treatment for fly bites: of these 240 went on sick pay for a total of 1200 days. The illness lasted 5 days, but especially sensitive or seriously bitten people were sick for as long as 10 days. Chemical control of the flies was attempted by application of Nuvan 100 SC with a Tifa-system warm-fog generator. The complaints were finally eliminated overnight by the fall of the River Tisza and a period of hot weather.--Copyright 1973, Biological Abstracts, Inc.

Presented at: The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 36 p, 2 fig, 2 tab, 35 ref.

Descriptors: *Water resources, *Planning, *Operations research, *Linear programming, Optimization, Dynamic programming, Simulation analysis, Equations, Computer programs, Constraints, Reservoir operation, Model studies.

With technology enabling the impounding, lifting and transporting of water for so many uses, water resources planning is a highly complex task. Modern techniques of operations research can be gainfully used in solving such complicated problems. Techniques of operations research, particularly linear programming, are introduced, using examples taken from various water resource settings. Considered also are dynamic programming and simulation analysis. No previous knowledge of systems analysis is required. (Bell-Cornell)

THE DEVELOPMENT OF METHODS FOR THE PLANNING OF UTILISATION AND PROTECTION OF YUGOSLAV WATER RESOURCES.
B. Djordjevic.
Presented at: The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 34 p, 2 fig, 9 ref.

Descriptors: *Water resources development, *Planning, *Protection, *Basins, *Optimization, *Multiple-purpose projects, Methodology, Hydrologic aspects, Legal aspects, Dynamic programming, Simulation analysis, Monte Carlo method, Equations, Mathematical models, Systems analysis.
Identifiers: *Yugoslavia, Organizational aspects.

A general survey is presented of problems arising in planning the utilization and protection of water

resources on a national scale and within individual basins. A brief illustration of the Yugoslav hydrological situation and the main water resource development problems is presented. Also given are the legal and organizational aspects of the complete system is described. The theory of the water resources development system is described through modern methods entailing a matrix with three vectors defining locations, quantities and quality of water resources. Special attention is paid to the problem of choosing criteria in solving optimization problems of complex systems, particularly treatment developmental, systematic-technical aspects of criterion selection. Cited are Monte Carlo-type methods used to simulate hydrological series in water resource development planning. The overall idea in the optimization of a complex, multiple-purpose system with the application of dynamic programming is illustrated, and experience collected to date in the solution of optimization problems in water resources development is summarized. SCHEDULING AND SEQUENCING IN WATER RESOURCE INVESTMENT MODELS,
Cuyo Univ., Mendoza (Argentina). Escuela de Economica.
T. B. Facet, and D. H. Marks.
Presented at: The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 35 p, 9 fig, 8 ref.

Descriptors: Water resources development, *River basins, *Investment, *Mathematical models, *Scheduling, *Linear programming, *Alternative planning, Optimization, Simulation analysis, Hydroelectric power, Irrigation, Systems analysis, Project planning constraints.
Identifiers: Integer programming, *Sequencing.

Two methodologies are suggested for water resources investment planning, involving the use of optimization and simulation. Two optimization models are constructed: A scheduling linear programming and a sequencing integer programming model; both are utilized to obtain a preliminary selection of sites and operating strategies for development of a river basin. The objective is economic efficiency: given the planning objectives, available streamflows, and budget and population, what needs to be considered, and when, in order to maximize net revenues from the proposed projects. The linear programming model screens the whole range of development alternatives over time for a river basin; it is deterministic in that hydrologic inputs are taken as mean values and as being certain to occur, but since the model covers a certain time period, it is possible to investigate the sensitivity of the solution to different traces of inflows. The water uses considered are hydroelectric energy production and irrigation. The sequencing integer programming model is a type of capital budget model. It requires a set of possible projects to be built with specified sizes over the planning horizon. The problem is in what sequence to construct the selected projects. (Bell-Cornell)

WATER RESOURCE DEVELOPMENT PROBLEMS IN A RURAL AREA IN TRANSITION,
Montana State Univ., Bozeman. Dept. of Agricultural Economics.
C. Hash, and H. Holje.
Presented at: The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 43 p, 1 tab.

Descriptors: Water resources development, *Rural areas, *Land development, *Montana, *Linear programming, *Economic impact, Research, Estimating, Evaluation, Recreation, Irrigation water, Water distribution, Benefits, Agriculture, Systems analysis.
Identifiers: *Bitterroot Valley (Montana), *Multivariate regression analysis, Policy change, Residential use.

The rapid transition of land and water resources from agricultural to recreation-residential use in Montana's mountain valleys presents: opportunities for increased return to the resources of the area, and problems of possible local tax increases and other typical kinds of urban problems. Basic research findings of the Montana University Joint Water Resources Research Center are described. A multivariate regression model was used to analyze data on sales of unimproved tracts of land in the Bitterroot Valley area to determine the contribution to the value of various amenities and detriments. A linear programming model of the resource economy of the Valley was used to evaluate the impact on local community well-being of certain policies to internalize some of the external costs of recreation-residential development. It was estimated that an annual benefit of approximately $63,000 could be realized by forcing developers and recreation-residential occupiers to consider and react to such externalities as the costs of: road maintenance, school transportation, and incompatible uses on adjacent lands. The linear programming model was used also to estimate the impact on the agricultural economy of improvements in the irrigation water distribution system. (Bell-Cornell)

DEVELOPMENT AND APPLICATION OF LARGE-SCALE WATER AND LAND ALLOCATION MODELS FOR THE UNITED STATES.
Iowa State Univ., Ames.
E. O. Heady.
Presented at: The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 42 p, 8 fig, 2 tab, 10 ref.

Descriptors: *United States, *Water allocation (Policy), *Water supply, *Mathematical models, *Regional analysis, *Water users, Spatial distribution, Land use, Resource allocation, Prices, Crops, Value, Economics, Comprehensive planning, Human population, Evaluation, Equations, Systems analysis.

The development and application of large-scale water and land allocation models for the United States are summarized, and the basic mathematical programming model is presented in detail. This model considers the location of all population and economic activity in the future, water supplies in all water supply areas, all individual farm producing areas, all crops and livestock products of the U. S., and all consumer markets. It considers land restraints in each of 223 farm producing regions, water and irrigable land supplies (restraints) in each of 51 water supply regions, and a set of demand equations for food commodities in each of 50 spatially-defined consumer markets. This model determines: (1) an optimal spatial allocation of water between agriculture, industrial, and metropolitan uses, among many producing regions and among alternative potential water development projects; (2) supply price and value of water; (3) conditions under which capital technology should be developed for land used under rainfed conditions, and substituted for water at other locations. The model selects optimum combinations of irrigated and dryland crops under alternative technologies for each. This model, and many of those based upon it, are the largest, most detailed and operationally useful water planning models applied in any country in the world. (Bell-Cornell)

MATHEMATICAL MODELLING OF CAPACITY EXPANSION OF AN INTEGRATED HYDRO--THERMAL ELECTRICAL POWER SYSTEM,
Secretaria de Recursos Hydraulicos, Mexico City.
C. D. D. Howard.
Presented at: The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 6 p, 1 fig.

Descriptors: *Planning, *Hydroelectric power, *Simulation analysis, *Mathematical models, Digital computers, Operating costs, Streamflow, Optimization, United States, Probability, Systems analysis, Thermal power.
Identifiers: *Capacity expansion, Power demand, Manitoba (Canada).

A study to define development strategy consistent with the long-range capacity expansion required to meet an increasing power demand in Manitoba and a developing export market in the U. S. is described. The expansion problem was studied for several years by the System Planning Division of Manitoba Hydro, with the aid of a digital computer program allowing for simulation of most of the features of a possible ultimate system. The program simulated the operation of a power system at each stage of its development using historical streamflow sequences; results provided information about the probability of satisfying future power demands with the trail system configuration and the expected cost of operating the trial development plan over a 20-year period. Considering the complexity of selecting the optimal sequence of development of some 35 power stations, as well as of two major river diversions and two reservoir developments (all very large), and due to a five-month time constraint, it was deemed impractical to develop new, unproven mathematical techniques. Linear and non-linear programming did not appear as promising techniques here. Hence, a combination of a simplified mathematical model, Manitoba Hydro's detailed simulation program, and engineering judgment were utilized to approximate what an optimal system would look like. Particularly, the time and level of the next development stage were considered. (Bell-Cornell)

Presented at: The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 33 p, 9 fig, 1 tab, 4 ref.

Descriptors: *Water allocation (Policy), *Computer programs, *Optimization, *Planning, *Water transfer, Texas, Simulation analysis, Water

supply, Water demand, Inter-basin transfers, Decision making, Methodology, Evaluation, Systems analysis, Mathematical models.
Identifiers: *Cost minimization, *Texas water plan, *Poland (Vistula River System).

Some computerized techniques are described which have been designed specifically for water resource planners in determining the economically optimum program for stage development of large-scale water transfer schemes. Particular attention is paid to multi-component systems involving interbasin transfers from areas of surplus to locations of intensive demand. The Trans-Texas Division of the Texas Water Plan and the Vistual River System (Poland) are used as case studies to demonstrate application of the new methodology. The Texas study planning package: (1) determines reservoir operating rules using the Out-of-Kilter Algorithm; (2) uses a random search technique to select schedules and a method of successive perturbations to improve schedules and reduce costs; (3) uses a simulation-optimization model based on the OKA for a secondary screening of the development plans; and (4) final-screens the development plans to determine minimum-cost feasible solutions and optimal operating criteria. An extension of the OKA and a 'One-Step Method' that allows evaluation of alternative system configurations under optimal operating conditions were used in the Vistula River study; the general approach and the problems encountered are outlined. Potentials for future application of simulation-optimization techniques in planning for the allocation of limited water resources are discussed. (Bell-Cornell)

NEED FOR METROPOLITAN WATER BALANCE INVENTORIES,
American Society of Civil Engineers, Marblehead, Mass. Urban Water Resources Research Program.
M. B. McPherson.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY10, Proceedings paper No 10078, p 1837-1848, October 1973. 4 fig, 28 ref.

Descriptors: *Water balance, *Systems analysis, *Municipal water, *Comprehensive planning, Water resources, *Management, *International commissions, *Water pollution, Engineering, Hydrology, Automation.
Identifiers: *Inventories, *Urban development, Water budget, Metropolitan areas.

The term 'water balance inventory' is used to describe the determination of the quantity and quality aspects of the fate of water as it cycles through a metropolitan area. More of these inventories are needed for evaluation of the hydrological effects of urbanization and related development of strategies for resource management and environmental protection. A general accounting for the overall movement of water and pollutants can be ascertained by comparing such complete inventories over successive time intervals. The status of metropolitan comprehensive water resource systems analysis is outlined, system complexities are described, and the need for inventories is explained. (An inventory requires definition of the interrelationships between numerous processes and events, and this coincides with requirements for the initial stage of a comprehensive systems analysis of the water resources of a metropolitan area). Progress is being made in a few notable instances, but in most cases serious obstacles have impeded advances; investments in such research, world-wide, are well below levels that could be justified by the economic and environmental importance of urban water resources. STUDIES IN THE ANALYSIS OF METROPOLITAN WATER RESOURCES SYSTEMS, VOL. VI ESTIMATING ECONOMIES OF SCALE IN THERMAL ELECTRIC POWER SYSTEMS SUBJECTED TO ENVIRONMENTAL QUALITY CONSTRAINTS,
Cornell Univ., Ithaca, N.Y.
C. R. Scherer, and D. P. Loucks.
Available from the National Technical Information Service as PB-224 500, $8.00 in paper copy, $1.45 in microfiche. Cornell University Water Resources and Marine Sciences Center, Ithaca, Technical Report No. 67, 1973. 376 p, 86 fig, 44 tab, 101 ref, 4 append. OWRR C-3101 (No 3684) (2).

Descriptors: Model studies, Optimization, *Linear programming, Electric power rates, Long-term planning, Methodology, *New York, *Cost analysis, *Electric power demands, Economic efficiency, *Economies of scale, Utilities, Environmental effects, Thermal pollution, *Water quality standards, Urbanization.

This study is concerned with the estimation of economies of scale in thermal-electric power systems subjected to water quality standards. The approach is engineering-economic. Mixed-integer programming is used to solve a mathematical model of a power system subject to constraints defining (1) the load duration curves of several demand centers located on a spatial grid or network, (2) endogenously determined reserves equal to the largest two generating units in the system, (3) nonlinear transmission losses, and (4) environmental quality and emission standards. The objective of the model is to minimize the sum of total capital and operating costs for generation, transmission and abatement of pollution emissions. Fixed charges and piecewise linear functions are used to define costs exhibiting increasing returns to scale. The model is applied to a major part of the New York State Electric and Gas Corporation system. The results show that: (1) a system dominated by coal-fired new steam plants manifests increasing long-run average total system costs, no matter what emission controls are imposed on its plants, (2) a system dominated by nuclear-fueled new steam plants would manifest decreasing average costs, no matter what emission controls are imposed, (3) when emissions are limited to 'near-zero', average total costs increase only very slowly with system peak output for coal-dominated systems, but decrease very rapidly for nuclear-dominated systems. The ratio of system capital cost to system total costs increases as permissible emissions are decreased.

GEORGIA'S WATER PROBLEMS AND RELATED RESEARCH NEEDS,
Georgia Inst. of Tech., Atlanta. Environmental Resources Center.
G. E. Willeke, A. C. Benke, A. M. Lumb, B. H. Kornegay, and W. Neely.
Available from the National Technical Information Service as PB-224 433, $4.25 in paper copy, $1.45 in microfiche. Completion Report ERC-1173, August 1973. 100 p, 2 fig, 3 tab, 26 ref, 2 append. OWRR A-041-GA (1). 14-31-0001-3810.

Descriptors: *Research priorities, *Management, Local governments, *Research facilities, *Scientific personnel, *Georgia, Irrigation, Ecology, Channeling, *Planning, Hydrologic cycle, Pollution abatement, State governments, Education, Universities.

Water problems and research needs are discussed by region of the State. They are also discussed under the headings of water quantity, quality, ecology, planning and management, and agriculture. A survey of research capability in Georgia colleges is included. Technology transfer needs are addressed and related to research. Though a water-rich State, Georgia has a wide range of water problems, including floods, droughts, pollution, local water shortages, soil erosion, and conflicts over the use of land and water resources. The problems are shifting from predominantly rural to predominantly urban. Ecological studies throughout the State, groundwater studies in the Piedmont and Mountain regions, erosion reduction in areas undergoing urban development, drought studies, and a number of supplemental irrigation problems are among the research needs. Many of the research needs are in planning and management, particularly those dealing with land and water use conflicts. A large research capability exists in Georgia, both at the graduate education and research universities and at the two- and four-year college units of the University System of Georgia. Utilization of this capability is hampered by the lack of suitable organizational arrangements and of funds for working on problems that are primarily of interest within the State. A major deficiency in Georgia is the absence of a research tradition in water resources. A research board or council is recommended to foster such a tradition, to increase the rate at which needed research is done, and to help disseminate the results.

Descriptors: Energy, Demand, *Alternative costs, Evaluation, Economic efficiency, *Economic prediction, Pricing, Investment, *Cost analysis, *Estimated costs, Marketing, *Resource allocation, Natural resources, Alternative planning.
Identifiers: *Energency demand, *Price distortions, *Energy uses, Energy conservation.

Various strategies are examined for reducing national energy demand. Suppose government chooses to reduce national energy use, and to do so in a cost-effective way. Then it is necessary to determine, for each potential energy saving, how much energy is involved and how costly the alternatives would be. The study begins by asking how much is now paid, or might be paid in the future, by various energy users. Many users get much of their energy at relatively low prices, and are thus encourage to waste it; the economist calls this 'price distortion', a form of 'market failure'. The study analyzes the kinds of market failure which seem to cause the present 'energy crisis', the kinds of government action which could rectify these failures, and the likely response of the economy to moderate price increases. Numerous actions, some large and some small, would be required to restore a more efficient functioning of the market for energy. Some of these actions have already been initiated. In an efficient market, energy price increases of 25% would prompt a halving of the growth of energy demand; through 1990, energy needs would grow 40% rather than the 100% project at current prices. ASSESSING THE SOCIAL EFFECTS OF PUBLIC WORKS PROJECTS,
Army Board of Engineers for Rivers and Harbors, Fort Belvoir, Va.
E. J. Baur.
Resident Scholar Program Research Paper No 3, June 1973. 35 p, append.

Descriptors: *Social impact, *Planning, *Utilities, Forecasting, Indicators, Measurement, *Social participation, *Project planning, Project post-evaluation, *Evaluation.
Identifiers: Social effects, Social indicators.

Social effects of public works projects should be viewed as resultants of interaction between agency and the public. Since the role the agency takes in this process is an important determiner of the outcome, the analysis of social effects must take account of the agency's public participation program. To avoid overlooking possible social effects, a complete list of social phenomena is needed. A systematic outline based on theoretical and empirical sources for inventorying social effects is presented. The identification and selection of phenomena for analysis that may be affected by a specific project must depend on the discernment of competent social scientists who are able to establish rapport with the public. The limitations of quantitative measurement methods requires supplementation by qualitative analysis. Where existing data sources are inadequate, the agency will need to use sample surveys and community studies. When forecasting effects, distinctions should be made between the stages of planning, construction, and operation. A continuing research program is recommended for determining the actual social effects of completed projects, developing improved methods of social research, and disseminating the substantive and methodological results of studies.

COST-EFFECTIVENESS OF WATER RESOURCES SYSTEMS DESIGN IN DEVELOPING COUNTRIES: CASE OF THE LOWER MEKONG,
Arizona Univ. Tucson. Dept. of Hydrology and Water Resources.
K. Chaemsaithong, L. Duckstein, and C. Kisiel.
Presented at: The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 23 p, 3 fig, 20 ref.

Descriptors: *Cost analysis, *Water resources development, *Design, *Methodology, *Optimum development plans, Alternative planning, Decision making, Cost-benefit analysis, Cost-benefit ratio, Systems analysis, Evaluation, Fixed costs.
Identifiers: *Cost-effectiveness, *Lower-Mekong Basin, Developing countries, Sensitivity analysis.

Cost-effectiveness is an extension of engineering economics, in which alternative plans are sought and compared. Herein, the cost-effectiveness approach is introduced for analysis and design of water resource systems. The approach is used to study various possible alternative water resources systems and to identify the best systems for the desired goals in developing countries where the problems such as shortage of foreign currency, non-equilibrium of market conditions, unemployment, etc. generally exist. The standardized cost-effectiveness as proposed by Kazanowski is followed: (1) Define desired goals; (2) identify system requirements or specifications; (3) develop alternative systems for attaining desired goals; (4) establish systems evaluation criteria relating system capabilities to specifications; (5) select fixed-cost or fixed-effectivness approach; (6) determine capabilities of alternative systems; (7) generate system versus criteria array; (8) analyze merits of alternative systems; (9) perform sensitivity analysis; and (10) document the rationale, assumptions and analyses underlying the previous steps. An example of the application of the approach in designing water resources systems in the Lower-Mekong Basin is presented. Classical methods of project analysis, such as cost-benefit analysis, are contrasted with the approach. Net benefit or the cost-benefit ratio are imbedded as one of the criteria in the fourth step of the cost-effectiveness procedure. (Bell-Cornell)

JOINT USE OF SCREENING AND SIMULATION MODELS IN MULTIOBJECTIVE PLAN FORMULATION,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
E. A. McBean, and J. C. Schaake, Jr.
Presented at: The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 46 p, 20 fig, 25 ref, 3 append.

Descriptors: Water resources, *Planning, *Model studies, *Simulation analysis, *Linear programming, National income, Costs, Benefits, Hydrology, Optimization, Irrigation, Reservoirs, Systems analysis.
Identifiers: *Screening models, *Argentina (Rio Colorado), Regional income.

Water resources planning should consider relevant social objectives such as national economic development, environmental quality, social well-being, and regional development. Some multiobjective planning procedures and principles developed for water resources planning in Argentina are presented; the methodology was applied to a case study of the Rio Colorado. Because of the complexity of this river, this article creates a simple example to illustrate the central points of the methodology and its application in Argentina. The aim in plan formulation is to identify those alternatives which lie on or near the net benefit transformation surface. This search may be assisted by mathematical programming and simulation models, and the use of a linear programming screening model and simulation analysis is described. The basis for the joint use of screening and simulation models in multi-objective planning is illustrated. A screening model 'screens'-out inferior alternatives by suggesting system configurations that would be optimal under certain assumed perferences for the system outputs; simulation models may be used to evaluate management and investment alternatives, and then used to estimate coefficients or parameters for screening models. (Bell-Cornell)
W74-00177

STATE WATER RESOURCE PLANNING IN ARID ARIZONA,
W. E. Steiner.
Presented at: The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 16 p.

Descriptors: *Water resources, *Planning, *Water supply, *Arizona, *Southwest U.S., *Arid lands, Input-output analysis, Groundwater basins, Economics, Engineering, Water allocation (Policy), Evaluation, Costs, Water users, Water quality, Water quantity, Population, Growth, Systems analysis, Mathematical models.
Identifiers: Environmental impact, Residential development.

Arizona's demand for water exceeds the supply and, as the population continues to increase, it appears that the future forbodes an even greater imbalance. Three problems faced in Arizona and the planning approaches undertaken by state government are discussed. First, southwestern states must decide whether to submit to costly augmentation of their available supplies or to live within the resources currently available and to modify use patterns and habits accordingly. Arizona proposes to develop plans for meeting each of these two alternative futures and to evaluate the costs and environmental impact for each plan. Second, the arid southwest faces problems in allocating amongst

competing uses and users. Arizona has utilized a computerized engineering systems approach which integrates an economic input-output model of the State's economy and engineering models of all water supply systems and the groundwater basins, to determine the allocation among users that would maximize the State's economy, minimize total water supply costs for all sources of water, and equalize groundwater declines to the extent practicable. And third, profligate development of new residential subdivision occurs in areas of severely limited water supplies. Before lot sales can commence in Arizona, the State must approve the adequacy of water supply for new subdivisions, regarding quality and quantity. (Bell-Cornell)

FROM RESORT AREA TO URBAN RECREATION CENTER: THEMES IN THE DEVELOPMENT OF LAKE TAHOE 1946-1956,
California Univ., Davis. Inst. of Governmental Affairs.
W. T. Jackson, and D. J. Pisani.
Environmental Quality Series No 15. April, 1973. 87 p, 2 fig.

Descriptors: *Water supply, *Sewage, *Lake Tahoe, *Public utilities, *Recreation, Environmental effects, Public Utility District, Urban land use, History, *California, *Nevada.
Identifiers: *Resort community, Historical development.

Lake Tahoe's development as a resort center dates to 1924. After World War II, improved access by highway and air, development of winter sports facilities and an increase in residential building began to tax Tahoe City's water supplies. Controversy over public and private use of beaches, building and zoning codes, and land use occurred in the 1940's and 1950's. Small private utility companies supplied water between 1946-1956, many of these being absorbed into public utility districts as communities expanded. California and Nevada Departments of Public Health demonstrated considerable concern over sewage systems draining into the Lake and into the Truckee River, the natural outlet of the Lake. As pollution increased bond issues to provide a new sewage system at Tahoe City were defeated by voters and court actions became frequent. Conflict between those wishing to preserve and those wishing to develop the environment became evident. Attempts at bi-state cooperation over the water level controversy including the Truckee River Agreement which set maximum and minimum levels of the lake, and the proposed building of the Prosser Reservoir for storage by the Corps of Engineers, are traced. Problems of sewage disposal were also tackled on a bi-state basis often involving bitter conflict. Problems of jurisdiction and finance continue. (Edwards-North Carolina)

SKIPPACK WATERSHED AND THE EVANSBURG PROJECT: A CASE STUDY FOR WATER RESOURCES PLANNING,
I. L. McHarg, and M. G. Clarke.
In: Environmental Quality and Water Development, W. H. Freeman and Co., San Francisco, 1973. C. R. Goldman, editor, p 299-330, 3 fig, 48 ref.

Descriptors: *Water quality, *Land use, *Reservoirs, Methodology, *Planning, Water supply, Pennsylvania, Regional Development, *Pennsylvania.
Identifiers: *Ecological planning approach, Skippack Watershed (Penn), Montgomery County (Penn.), Evansburg Reservoir (Penn.), Urban growth.

An ecological approach to planning developed in a study of Skippack Watershed in Montgomery County, Pa., where a controversy emerged over a proposed state reservoir project. Models of uncontrolled growth indicate that in the next 15 years the watershed will change from a rural area on the fringe of suburbia to a rapidly developing suburban area. From an ecological perspective, the watershed is a composite of resources, offering gradations of opportunities and constraints for all land uses. Some conclusions were: the proposed Evansburg Reservoir would be quite eutrophic if present water quality were not significantly improved, the project would destroy significant remnants of the county's cultural heritage and there is no evidence that the project would be an economical solution to the region's water supply needs. A recommendation against its construction was thus made and an alternative of 2 intermediate recreation impoundments within an area for a state park suggested. Essence of the planning approach used is described including documentation of existing and anticipated urban growth to understand land-use demands; inventory of natural and cultural resources using a resource utilization matrix model to relate propspective land uses to the watershed's resources; kinds of cost and benefits considered varied with the specific resource and land use being evaluated; and evaluation of the environmental consequences of building the project. (Edwards-North Carolina)
W74-00445

WATER DEVELOPMENT AND URBAN RECREATION,
L. H. Scott.
In: Environmental Quality and Water Development, W. H. Freeman and Co., San Francisco, 1973. C. R. Goldman, editor, p 341-353, 6 ref.

Descriptors: *Outdoor recreation, *Recreation, *Land use, *Planning, *Public access, Parks.
Identifiers: *Waterfront, *Shoreline, *Intergovernmental coordination, *Urban waterfront, Regional planning, Urban shorelines.

Policy recommendations made are: federal water development and conservation programs should be consolidated and coordinated; provision of public access should be made a condition of federal assistance programs in shoreline areas; environmental impact statements should consider potential for public access in each project; shoreline and coastal regulatory elements should be required in general, regional and state plans under state planning enabling legislation; private owners providing public access to shoreline should have tax relief; railroad rights-of-way that traverse city or county boundaries and shoreline areas should come under increased local jurisdiction; new federal assistance should be made available for purchase or less-than-fee easements to shorelines for public access; statutes controlling state port authorites should be amended to require public access in new projects; aid for transportation of poverty populations to distant water recreation facilities be considered; and that Model Cities programs be given 'Sign off' powers for all water development programs across federal agency lines to assure their input in these programs. Fragmented political jurisdictions, private industrial ownership of waterfront sites, conflicting land uses, and a lack of effective regional planning and institutions, have all contributed to limiting the realization of the potential of urban waterfronts for public use. A critical review is made of direct park acquisition, local general plans, zoning and subdivision ordinances, tax incentives, capital budgeting, urban renewal, and the Model Cities program, as they are concerned with providing public access and waterfront recreation sites. (Edwards-North Carolina)
W74-00446

METROPOLITAN DEVELOPMENT GUIDE, WATER RESOURCES POLICY PLAN, PROGRAM.
Metropolitan Council of the Twin Cities Area, Minn.

May, 1973. 39 p, 2 fig.

Descriptors: *Water resources, *Surface drainage, *Water supply, *Water management, *Comprehensive planning, Planning, Water resources development, Urbanization, Water demand, Groundwater, Non-structural alternatives, Runoff, Water quality control, *Minnesota.
Identifiers: Water resource policies, *St. Paul (Minn.), *Minneapolis (Minn.).

The Metropolitan Council is directed by state law to prepare and adopt comprehensive development plans and policies for the Twin Cities metropolitan area. One element of this total development guide is the water resources policy plan. The policy plan is divided into three parts: a discussion of the general nature of water resources and related problems in the area; a long range poligy plan which contains 31 specific policy recommendations and is intended to guide future development and public projects in directions to alleviate water resource problems; and a list of long and short term objectives and the agencies responsible to implement them. The emphasis of the policy plan is on water supply and surface water drainage. Although the area has abundant supplies of surface water the increasing demands for water will require careful management and an increasing use of groundwater. During low flow periods there are likely to be shortages of water for cooling water and waste assimilation. Low flow augmentation measures in cooperation with the Corps of Engineers are being considered. Surface water drainage is becoming a significant problem as urbanization increases runoff, degrades water quality, and reduces groundwater recharge. Various policies are proposed to handle these problems, e.g. floodplain management measures, restricted extension of water and sewer lines. (Elfers-North Carolina)

6D. Water Demand

WATER USE--COMMITTEE REPORT, PART II, REVIEW OF THE JOHNS HOPKINS UNIVERSITY RESEARCH PROJECT METHOD FOR ESTIMATING RESIDENTIAL WATER USE.
American Water Works Association, New York. Committee on Water Use.

Journal of American Water Works Association, Vol 65, No 5, p 300-301, May 1973. 1 illus.

Descriptors: Domestic water, *Water demand, *Use of water, Evapotranspiration, Utilities, Water requirements, Effective precipitation, Population density, Analytical techniques, Model studies, Planning, Research and development, Consumptive use, Public use.
Identifiers: *Residential water use.

A brief review is presented of a method developed by researchers at Johns Hopkins University for estimating residential water use. The project was sponsored by the Federal Housing Administration in cooperation with sixteen water utility companies. The applicability of the method developed as a practical tool for use by utility managers and engineers in estimating future residential average and peak flow requirements for particular communities is evaluated. The calculations made under the Johns Hopkins method require local data in the following areas: market value per dwelling unit, potential evapotranspiration, effective precipitation, and dwellings per acre. One serious problem with the method is that variation in market value in different sections of the country or changes in value due to inflation will result in a variation in the calculated water use. Thus, a regional market valuation should be considered and this may present a large problem to a utility whose personnel are not normally qualified to conduct such an appraisal. While the Johns Hopkins method does represent a commendable effort to determine water use on a theoretical basis, more research and experience are required before its general application can be recommended. DEMOGRAPHIC EFFECTS OF WATER DEVELOPMENT,
J. Hollis, and J. McEvoy III.
In: Environmental Quality and Water Development, W. H. Freeman and Co., San Francisco, 1973. C. R. Goldman, editor, p 216-232, 4 fig, 11 ref.

Descriptors: *Water demand, *Water supply, *Urbanization, Population, Water resources, *California.
Identifiers: *Population distribution, *Los Angeles, Consumption, Water-stimulated population growth.

From a demographic perspective the crux of the water problem in the U.S. lies in the discrepancy between the natural distribution of water supply and the distribution of consumers. Water use is increasing and projects are planned to meet the needs of an area in the foreseeable future, based on some projected or trend- based population likely to be overly optimistic. Construction of such projects usually insures that the projected population becomes a reality, so projects become both self-fulfilling and self-perpetuating expecially for urban centers in semi-arid parts of the U.S. Three national demographic trends, relatable to water demand and supply, are noted: absolute growth of population, the movement of people to the West, and increasing urbanization. There is an increasing tendency for population, especially urgan, to increase in those parts of the country with the most meager water resources. Urbanization creates an intense, almost constant, demand for high quality water in a very small area, to be met largely by adjacent surface water. Implications of a coastal-urban distribution of population are that considerable sums must be spent to find and appropriate distant water supplies. Los Angeles is the best example of a city owing its economic and demographic growth to the skillful management of its water supply and the foresight of its water planners. It is recommended that the Federal Government establish a poligy of carefully evaluating all population projections used as justification for water project proposals. (Edwards-North Carolina)

THE QUEST FOR WATER IN NEW MEXICO,
New Mexico Inst. of Mining and Technology, Socorro. Dept. of History.
P. W. Christiansen.
Available from the National Technical Information Service as PB-224 449, $3.50 in paper copy, $1.45 in microfiche. New Mexico Water Resources Research Institute La Cruces, Technical Completion Report 029, August 1973. 65 p, 188 ref. OWRR A-026-NMEX (1).

Descriptors: *History, *Water resources development, *Irrigation systems, *New Mexico, *Water supply, Water control, Water utilization, Irrigation engineering, Water conveyance, Water users, Prior appropriation, Water wells, Farm management, Technology.

This study assembled historical data relating to water control and applied technology during Indian, Spanish, and Anglo-American periods in New Mexico. In addition, historic forces, such as law, social institutions, economic habits, irrigation practices, and transportation, affecting the development of water resources were laid out and evaluated, thereby giving a comparison of efforts and applications across the three major cultures making up New Mexico's historical pattern. The arid nature of New Mexico's climate forced all of its inhabitants, Indian, Spaniard, and Anglo-American alike, into maximum technical efforts toward water control. The Indian and the Spaniard tended to utilize similar techniques and generally practiced subsistence agriculture. Both Indian and Spanish villages have, by-and-large, clung to methods centuries old and have not had the opportunity or desire to utilize new scientific and technological advances. On the other hand, the Anglo-American settled in unoccupied areas, practiced commercial agriculture, and applied massive technology to water development. This heavy technical application in the major water courses resulted in important economic advances, but has also created serious problems which can only be solved by even more massive applications of technology. WISCONSIN'S SHORELAND PROTECTION PROGRAM: A STATE-LOCAL REGULATORY APPROACH TO NATURAL RESOURCE PRESERVATION,
D. A. Yanggen.
In: Environmental Quality and Water Development, W. H. Freeman and Co., San Francisco, 1973. C. R. Goldman, editor, p 354-375, 2 fig, 9 ref.

Descriptors: *Water quality control, *Wisconsin, Regulation, *Shore protection, *Shores, *Zoning.
Identifiers: *Shoreland protection, Shoreland Protection Law of 1966.

Under Wisconsin's Shoreland Protection Act of 1966, the state establishes minimum standards for local land use controls and retains the authority to adopt regulations if the local government fails to act. While a number of federal attempts have been made to establish the basis of a national land use policy for protecting the environment and to encourage state action on land use planning and controls, only the Coastal Zone Management Act of 1972, concerned with coastal waters and adjacent shorelines, has become law. Nevertheless, a few states have acted to assert control over land uses affecting the environment, and among these is Wisconsin's Shoreland Protection Law of 1966 which is an attempt to protect the natural resource values of shorelands through a joint state and county regulatory effort. The statute sets out broad policy objectives of shoreland protection, special zoning objectives, directions for a state agency to prepare standards and criteria for local navigable water protection regulations, creates special shoreland corridors of 1000 foot depth for county zoning of unincorporated areas adjacent to navigable waters, and authorizes state level zoning on an unprecedented scale if counties fail to adopt adequate ordinances meeting minimum state standards. Essentially a natural resource oriented development code, regulations appling to all shoreland areas include minimum standards for water supply and waste disposal, tree-cutting controls, setbacks for structures from highways and navigable waters, minimum lot sizes, filling and grading limits, lagooning and dredging controls, and subdivision regulations. CASE DESCRIPTION: MORRISON CREEK STREAM GROUP BASIN, CALIFORNIA,
M. S. Petersen.
In: Environmental Quality and Water Development, W. H. Freeman and Co., San Francisco, 1973. C. R. Goldman, editor, p 465-477, 2 fig, 2 append.

Descriptors: *Flood control, *Flood protection, Planning, Environmental effects, *California, Land use, Floodways, Political aspects, Urbanization.
Identifiers: *Public participation, *Citizen involvement, Retardation basins, Morrison Creek Stream Group Basin.

In May, 1969, U.S. Corps of Engineers, Sacramento District, made public a tentative plan for flood protection and recreation in the Morrison Creek Group Basin. The nature of the basin and water related problems and the characteristics of the plan are presented. Conservation interests criticized the plan because wildlife habitat could feasibly be converted to urban use. The Corps expanded its planning process to include private interests and public agencies. Alternatives were developed and one selected with concurrence of Sacramento County, the local project sponsor. The alternative substituted a flood retardation basin in place of a leveed floodway. The author, a planner with the Corps, states: 'the Corps regarded the views expressed as legitimate criticism representing the position of large number of residents of the Sacramento metropolitan area. It was apparent that the Corps needed a clearer view of the preferences of citizens...' Public involvement techniques centered on limited public meetings and the establishment of a Citizens Environmental Advisory Committee. In an attempt to head off potential conflicts public sectors are now involved early in studies and continue to be present. (Edwards-North Carolina)

WATERSHED PROGRAM LACKS ECOLOGICAL DIMENSIONS,
L. R. Jahn.
In: Environmental Quality and Water Development, W. H. Freeman and Co., San Francisco, 1973. C. R. Goldman, editor, p 183-195, 4 fig, 16 ref.

Descriptors: *Small watersheds, *Ecosystems, *Degradation (Stream), Environmental effects, Conservation, Channel improvement, Land use, Wetlands.
Identifiers: Floodplain management.

Two of the most serious problems of the small watershed program involve maintaining valuable wetlands and streams and their associated shorelands and flood plains from inappropriate physical developments. Vast amounts of drainage, including channelization, have been applied in a detrimental manner leading to degradation and destruction of ecological systems, environmental quality, and public values. Outdated Congressional directives, misleading terminology, inadequate cost-benefit calculations and lack of independent ecological review have resulted in incomplete planning of projects. An ecological dimension must be incorporated into watershed planning and development. Immediate evaluation of watershed projects should include: post-construction investigations of the 273P.L. 566 watersheds completed by July, 1970 and upstream watershed projects authorized through earlier enacted laws;reexamination of 1,288 watersheds approved for federal planning assistance; and pre-authorization evaluations of 8,904 small watersheds with problems as identified by the National Soil and Water Conservation Needs Inventory. State and federal resource agencies should inventory land and water resources in each proposed watershed project in sufficient detail to permit designation of important landscape features for maintenance and ecological management. Special concern should be given to protected stream sections, flood plains, wetlands, sites to hold excess runoff waters, and other unique features such as recharge areas. (Edward-North Carolina)

RIVERS AND AMERICANS: A CENTURY OF CONFLICTING PRIORITIES,
R. Nash.
In: Environmental Quality and Water Development, W. H. Freeman and Co., San Francisco, 1973. C. R. Goldman, editor, p 78-94, 10 ref.

Descriptors: *Water supply, *Political aspects, *Reservoir construction, *California, Environmental effects, Conservation, Developed waters, History, Dams, Reservoir sites, Reservoirs.
Identifiers: San Francisco, *Hetch Hetchy Valley (Calif), Yosemite National Park.

From 1905 to 1913, a controversy raged as to whether California's Hetch Hetchy Valley in Yosemite should remain inviolate as a national park or be used as a water supply reservoir for the needs of the city of San Francisco. The outline of the battle for development of Hetch Hetchy Valley is described. Ideas for such use for water supply and hydro-electric power--arose as early as 1882, although urgency and public sympathy for San Francisco's search for water increased with the earthquake and fire of 1906. Application for the use of the valley was approved by the Secretary of the Interior in 1908, however conservationists, especially John Muir, attempted to build Hetch Hetchy into a symbol of ethical and aesthetic qualities in opposition to its use. Because of strong opposition San Francisco's application died in the Sixtieth Congress. More debate and additional hearings preceded signature of the bill permitting development in December, 1913 by President Wilson. That the controversy occurred at all is held to be significant. Changes in public attitudes toward conservation occurred in the next half century and the burden of proof was placed on proponents of development. The Echo Park Dam controversy demonstrated the power of private citizen-action conservationist groups while intervention by conservationists resulted in Marble and Bridge Canyon dams along the Colorado River not being built. New river development projects whould be reviewed for their environmental impact. (Edwards-North Carolina)

AN ELECTRONIC SENSOR AND CIRCUIT FOR AUTOMATIC OPERATION OF RAINFALL SHELTERS,
Mississippi State Univ., State College. Dept. of Agronomy.
C. M. White, D. L. Myhre, and S. G. Williams.
Agron J., Vol 64, No 6, p 847-849, 1972, Illus.
Identifiers: *Automation, *Electronic equipment, Operations, *Rainfall shelters, Sensors.

A simple, inexpensive, and durable electronic sensor for automatic operation of rainfall shelters for research plots is described. The advantages of the new circuit are: the very high input resistance overcomes problems associated with low conductivity of rainfall; the limited amount of current through the grid reduces corrosion; and the time delay prevents reversing of the shelters while in motion. Provision for heating the sensor grid prevents condensation of dew and hastens evaporation on cloudy days after rain stops.--Copyright 1973, Biological Abstracts, Inc.

MODIFICATION OF THE WAY OF READING THE VALUES OF RESISTANCE MEASURED BY MEANS OF THE PNEUMATIC SOIL RESISTANCEMETER (PENETROMETER TYPE), (IN POLISH),
Instytut Uprawy Nowozenia i Gleboznawstwa, Pulawy (Poland).
S. Tokarz.
Pamiet Pulawski, 45, p 85-91, 1971, Illus, English summary.
Identifiers: Measurement, Meters, Modification, Penetrometer, *Pneumatic meters, *Soil meters, Type.

A solution to the problem of recording the values of soil resistance to penetration, measured by means of Rzasa's pneumatic resistancemeter is presented. The results of measurements from the whole depth are recorded in graphic form. The use of recorder allows a reduction in the number of persons tending the apparatus from three to two to one. It also allows improvement of the exactness of measurements and the obtention of resistance values on the whole depth of the measurement.--Copyright 1973, Biological Abstracts, Inc.

APPLICATION OF ECOLOGICAL, GEOLOGICAL AND OCEANOGRAPHIC ERTS-1 IMAGERY TO DELAWARE'S COASTAL RESOURCES PLANNING,
Delaware Univ., Newark. Coll. of Marine Studies.
V. Klemas.
Available from NTIS, Springfield, Va., 22151, E73-10426 Price $3.00 printed copy; $1.45 microfiche. Contract report to Goddard Space Flight Center, March 29, 1973. 6 p, 4 ref.

Descriptors: *Remote sensing, *Aerial photography, *Satellites (Artificial), *Vegetation, *Delaware River , Bays, Estuareis, Tides, Salinity, Turbidity, Data collections, Sampling, Correlation analysis, Coasts, Marshes.
Identifiers: *Delaware Bay area.

Imagery from four successful ERTS-1 passes over the Delaware Bay and Atlantic Coastal Region have been evaluated to determine visibility of aquatic features. The overpasses took place on August 16, October 10, December 3, 1972, and January 26, 1973. Visual inspection, density slicing and multispectral analysis of the imagery revealed strong suspended sediment patterns and several distinct types of aquatic interfaces or frontal systems. Measurements from boats and photography from low altitude aircraft, performed before and during the satellite overpasses, permitted a limited degree of correlation between satellite and ground data on the type and quantity of suspended matter. Multispectral analysis of high altitude RB-57 and U-2 photographs indicated that five vegetation communities could be clearly discriminated from 60,000 feet altitude including (1) salt marsh cord grass (Spartina alterniflora), (2) salt marsh hay and spike grass (Spartina patens and Distichlis spicata), (3) reed grass (Phragmites communis), (4) high tide bush and sea myrtle (Iva species and Baccharis halimifolia), and (5) a group of freshwater fowl. EXPECTED OPTIMUM RECORD LENGTH AS A BASIS FOR HYDROLOGIC NETWORK DESIGN,
Geological Survey Washington, D.C. Water Resources Div.
M. E. Moss.
Presented at: The International Symposium on the Planning of Water Resources, Mexico City, December 4-8, 1972. 21 p, 3 fig, 10 ref.

Descriptors: *Hydrologic data, *Design, *Networks, *Data collections, *Simulation analysis, Operating costs, Optimization, Methodology, Water resources, Planning, Benefits, Evaluation, Parametric hydrology, Decision making, Systems analysis.
Identifiers: *Data evaluation, *Bayesian estimation.

Water resources planning necessitates providing sufficient hydrologic data at each decision point on the planning horizon. Design of a data collection network can be based upon the worth of these data in the planning and design process. Two methodologies for the evaluation of data worth, simulation and Bayesian estimation, are examined, and both are found to have some deficiencies as tools for network design. Attributes of each methodology are combined to define the expected optimum record lengh, which is an estimate of the length of record that maximizes expected net benefit derived from a decision that is deferred in order to collect additional data. Considered are the costs of operating the data collection system and the costs of delaying the decision. Alternate methods of attaining an equivalent expected optimum record length are discussed. Regional regression methods may suffice when the regional hydrologic-data base is sufficient. Parametric modeling may also be used to extract the required hydrologic information from a combination of relatively short hydrologic records and more generally available long meteorologic records. AN ON-LINE SPECTROPHOTOMETER FOR COLLECTION OF MANIPULATION OF ABSORBANCE SPECTRA,
Georgia Univ., Athens. Dept. of Biochemistry.
R. J. DeSa, and J. E. Wampler.
Applied Spectroscopy, Vol 27, No 4, p 279-284, July/August, 1973. 5 fig, 1 tab, 6 ref. PHS-GM-16834-03.

Descriptors: *Automatic control, *Data collections, *Laboratory equipment, *Data transmission, *Date processing, Spectrophotometry, Instrumentation, Digital computers.
Identifiers: *On-line systems, *Absorption spectra, Ultraviolet spectrophometry, Ultraviolet spectra, Absorbance, Spectral analysis.

A uv-visible recording spectrophotometer has been developed which uses an on-line general purpose digital computer and the optical train of a conventional double beam recording spectrophotometer. The computer controls all functions of the instrument and permits the collection and manipulation of high quality absorption spectra without the use of electronic or optical correction devices. Spectra are represented by a series of up to 500 individual data points. Spectra can be manipulated in a variety of ways to meet particular experimental situations and can be displayed or plotted on an arbitrary absorbance scale. A spectrum can be added to, or substracted from, any other spectrum, differentiated, converted to log absorbance, or multiplied by an arbitrary factor. Data can be preserved on paper tape or presented graphically as a high quality labeled plot of variable size on either a wave-length or a wave number scale. The complete system can scan a full spectrum at a maximum rate of 30 nm/sec over any part of a range from 230 to 700 nm. Details of the system are presented with examples of its performance. FLOODS IN JACKSON QUADRANGLE, MISSISSIPPI,
Geological Survey, Washington, D.C.
K. V. Wilson.
Open-file atlas, 1 sheet, 1973. 5 fig, 1 photo, 1 map, 4 ref.

Descriptors: *Floods, *Flood data, *Flood profiles, *Flood frequency, *Mississippi, Flood plains, Flood damage, Flood protection, Hydrologic data, Maps, Hydrographs.
Identifiers: *Jackson floods (Miss), Atlas.

This one-sheet atlas presents hydrologic data that can be used to evaluate the extent of flooding that may be expected on Hanging Moss, Eubanks, Town, Lynch, Hardy, and Cany Creeks, and the Pearl River at Jackson, Miss. The technical information provided will aid in reaching decisions for sound economic management of flood-plain areas. The areas inundated by floods having a recurrence interval of 100 years are shown on a topographic map, with flood boundaries determined for 1972 channel conditions and conditions of urban development. Changed waterway openings at bridges and culverts, improved drainage systems, increased urbanization, retention structures, and other cultural changes may affect the boundaries of inundation by future floods. Also included are graphs showing flood frequency and flood profiles. (Woodard-USGS)

STREAM GAUGING INFORMATION, AUSTRALIA--SUPPLEMENT 1971.
Australian Water Resources Council, Canberra.

Australia Government Publishing Service, Canberra, 1973. 43 p.

Descriptors: *Gaging stations, *Flow measurement, *Streamflow, *Network design, *Australia, Stream gages, Sites, Indexing, Drainage area, Data collections.

This publication is the second supplement to Stream Gauging Information, Australia,

December 1969, the first supplement being entitled Stream Gauging Information, Australia, Supplement 1970. It contains details of changes and additions made in the stream-gaging network during the 12 months period ending December 31, 1971. Two more supplements will be issued until a revised catalog, based on data as of December 31, 1974, is published. During 1971, 156 new stream-gaging stations were established, 37 were discontinued and 4 were reestablished. Seven gaging stations, which had previously been omitted, are included in the supplement. This increase of 130 brings the total number of gaging stations in operation on December 31, 1971 to 2,535. (Woodard-USGS)

RECONNAISSANCE OF THE WATER RESOURCES OF BEAVER COUNTY, OKLAHOMA,
Geological Survey, Washington, D.C.
R. B. Morton, and R. L. Goemaat.
For sale by USGS, Washington, D.C. 20242, price $1.25 per set. Hydrologic Investigations Atlas HA-450, 1973. 3 sheets, 7 fig, 4 map, 1 tab, 18 ref.

Descriptors: *Water resources, *Groundwater resources, *Streamflow, *Water quality, *Oklahoma, Hydrogeology, Water wells, Aquifer characteristics, Water yield, Water utilization, Irrigation, Groundwater movement, Water level fluctuations, Groundwater recharge, Chemical analysis, Maps, Hydrographs, Hydrologic data.
Identifiers: *Beaver County (Okla).

Groundwater is the major source of water supply in Beaver County, Okla. Because of the rapidly increasing demand for the limited supply of water for irrigation, geologic data are presented to aid in the management of groundwater resources. This 3-sheet atlas presents general information on the availability of groundwater, on the chemical quality of water, and on streamflow. The chemical quality of water generally is poorer than that of water elsewhere in the Oklahoma Panhandle, and the ability to obtain good quality water may become increasingly difficult as the water resources are developed. The Ogallala Formation is the dominant surficial deposit and principal aquifer in Beaver County. The Ogallala is relatively thin in the county, and is breached in many places, particularly along tributaries of the Beaver River. Where streams have eroded the Ogallala, the underlying Permian red beds crop out in elongate patterns paralleling the stream channels. The greatest depth to water is about 225 feet below land surface in the southwestern part of the county near Gray. The shallowest water is less than 25 feet deep along the largest streams such as Kiowa Creek and the Beaver and Cimarron Rivers. The dissolved-solids concentrated in water from the Ogallala ranges from approximately 150 to 600 mg/liter. The largest streams in the county are the Cimarron and Beaver Rivers. Water flows in the Cimarron all of the year whereas the Beaver is dry one or more months during the year. (Woodard-USGS)
W74-00534

FLOOD OF JUNE 1972 AT ELMIRA, NEW YORK,
Geological Survey, Washington, D.C.
K. I. Darmer, and L. A. Wagner.
Available from USGS, Washington, D.C. 20402, Price $0.75. Hydrologic Investigations Atlas HA-518,1973. 1 sheet, 5 fig, 1 map, 1 photo.

Descriptors: *Floods, *Flood data, *New York, Maps, Hydrographs, Streamflow, Gaging stations, Flow rates, Peak discharge, Rainfall, Runoff, Flood profiles, Flood frequency, Flood peak, Historic floods, Hydrologic data.
Identifiers: *Elmira (NY).

This one-sheet atlas describes the greatest flood disaster in the history of New York which occurred during late June 1972 as a result of torrential rains brought by the remnants of Tropical Storm Agnes. The city of Elmira, in southwest-central New York, sustained the most extensive flooding of any populated area in the flood zone of New York. Flooding was primarily due to Chemung River, but Newtown Creek and Seeley Creek also experineced high flows. On June 23, 1972, the Chemung River at the Chemung gaging station crested at a stage of 31.62 feet corresponding to an elevation of 810.25 feet above mean sea level (discharge 189,000 cfs). The previous maximum stage at this station was 23.97 feet corresponding to an elevation of 802.60 feet above mean sea level (discharge 132,000 cfs) on May 28, 1946. Data presented in graphs include: cumulative precipitation from June 16 to 26, 1972, at Alfred and Elmira; annual floods above gage height 19.0 feet, 1904-72, Chemung River at Chemung; flood-frequency curve for Newtown Creek at Elmira, 1938-71; flood-frequency curve for Chemung River at Chemung 1904-71; and profile of floods of June 1972 and May 1946, Chemung River from Elmira to Chemung. (Woodard-USGS)
W74-00535

GEOHYDROLOGY OF DONIPHAN COUNTY, NORTHEASTERN KANSAS,
Geological Survey, Washington, D.C.
C. K. Bayne.
For sale by USGS, Washington, D.C. 20242, Price $0.75. Hydrologic Investigations Atlas HA-462, 1973. 1 sheet, 1 fig, 6 map, 1 tab, 13 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water wells, *Water quality, *Kansas, Hydrogeology, Geology, Water utilization, Water yield, Maps, Hydrologic data, Water table.
Identifiers: *Doniphan County (Kans).

This one-sheet atlas describes the groundwater resources of Doniphan County, the northeastern most county in Kansas. Reports describing the water resources of the area contiguous to Doniphan County are listed in the selected references. The locations of wells and test holes are identified according to the Federal system of land subdivision shown by a well-numbering system diagram. Adequate supplies of water for domestic and stock use generally are available from wells in the glacial deposits underlying the upland areas of Daoniphan County. Adjacent to the major streams, the alacial deposits are then or have been removed by erosion. In these localized areas, small supplies of water are available from wells drilled into bedrock aquifers. Large supplies of water are available only from wells in alluvial deposits in the Missouri River valley. The groundwater is hard or very hard but may be rendered soft by simple treatment. Water from wells in the Missouri River valley and in some tributary valleys is very high in iron content. Water containing excessive amounts of nitrate occurs locally in all the aquifers. MUDDY CREEK DAM AND RESERVOIR, EMERY COUNTY, FEASIBILITY STUDY.
Rollins, Brown and Gunnell, Inc., Provo, Utah.

Available from NTIS, Springfield, Va. 22152 as COM 73-10385 Price $3.00 printed copy; $1.45 microfiche. Report proposed for Utah Division of Water Resources, Salt Lake City, August 1971. 26 p, 15 fig, 13 tab.

Descriptors: *Dam design, *Water resources development, *Water supply, *Utah, Reservoirs, Flood control, Water utilization, Engineering structures, Costs, Economics, Irrigation, Recreation, Surveys, Hydrologic data, Planning, Projections, Evaluation.

The physical feasibility of constructing a dam and reservoir on Muddy Creek in Emery County, Utah, to be used to store water for irrigation of 8,066 acres of land on 67 farms is discussed. The project, when built, will include multipurposes such as fishing, waterborne recreation, flood control, soil conservation, and water-quality improvement. This investigations is sufficiently detailed to assure that a dam and reservoir can be constructed at an approximate cost of $1,600,000 and benefits, direct and indirect, substantially exceed the cost. This project would be in keeping with the goals and guidelines established by the State Board of Water Resources, which include the enhancement of life for rural areas of Utah, and the more efficient use of Utah's limited water supply. Pertinent information and data include: geology, climate, land classification, land use, land ownership, water rights, water supply, water quality, water requiremns, water development plan, flood protection, and dam design. 8B. Hydraulics

NAVIGATION CONDITIONS AT CONFLUENCE OF ARKANSAS, VERDIGRIS, AND GRAND RIVERS,
Army Enginner Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
J. J. Franco, and C. D. McKellar, Jr.
Available from NTIS, Springfield, Va., 22151, as AD-757 598, $3.00 in paper copy, $1.45 in microfiche. Technical Report H-73-2, March 1973. 31 pl, 9 photo, 32 plate, 1 tab.

Descriptors: *Channel improvement, *Navigation, *Model studies, *River training, *Oklahoma, Engineering structures, Hydraulic models, Harbors, Dredging, Locks, Dams.
Identifiers: *Arkansas River (Okla), Shoaling effects.

The development of an adequate navigation channel was investigated for the reach of the Arkansas River from the mouth of the Verdigris River downstream to below the new U.S. Highway 62 Bridge, as part of the Arkansas River multipurpose project. A movable-bed model reproducing about 5.7 miles of the Arkansas River in the Webbers Falls Lock and Dam pool, including the lower reaches of the Verdigris and Grand Rivers, to scales of 1:80 vertical and 1:120 horizontal was used for the study. The purpose was to develop a system of training structures that would reduce or eliminate shoaling at the confluence of the Verdigris and Arkansas Rivers, develop a channel through the navigation span of the new U.S. Highway 62 Bridge, and reduce the need for maintenance dredging in the Muskogee Harbor area, without producing currents that would be troublesome for navigation. Satisfactory navigation conditions will be provided with the plan developed, except that some shoaling might occur at the mouth of the Verdigris River during low Arkansas River flows and little or no flow in the Verdigris River. (Woodard-USGS)

8C. Hydraulic Machinery

ELECTRICAL POWER PLANT DRIVEN BY OCEAN WAVES AND TIDES,
J. Donatelli.
U. S. Patent No. 3,746,875, 5 p, 7 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 912, No 3, p 1105, July 17, 1973.

Descriptors: *Patents, *Electric powerplants, Ocean waves, Tides, *Tidal powerplants, *Powerplants, Tidal energy, *Generators, Electricial equipment.
Identifiers: *Floating platforms.

A floating platform is connected to a fixed structure which is mounted on the ocean floor. The platform is adapted to move with waves and tide. One generator is included which is driven by the up and down movement of the platform to generate electricity. The fixed structure is oriented to hold a landward edge portion of the floating platform towards a selected ocean shore and a seaward edge portion of the floating platform away from the selected shore. The platform is preferably constructed to slope from an elevated position above the water surface from both its seaward and landward edge portions toward its center, defining first and second paths of water flow. Other generating mechanisms, preferably including paddle wheels, are mounted across the first and second paths of flow to be driven by the water flowing therealong, thus generating electrical energy from the flow of waves and tides toward and away from the shore. A four-way electrical power plant is thus provided which operates to simultaneously generate energy from the up and down movement as well as from the two directional flow of ocean waves and tides towards and away from shore. DEMOLITION OF FT. MEADE DAM, STURGIS, SOUTH DAKOTA, JUNE 1972,
Army Engineer Waterways Experiment Station, Livermore, Calif. Explosive Excavation Research Lab.
B. B. Redpath.
Available from NTIS, Springfield, Va. 22151 as AD-757 597; Price $3.00 printed copy; $1.45 Microfiche. Miscellaneous Paper E-73-1, January 1973. 12 p, 12 fig.

Descriptors: *Flood damage, *Dams, *Explosives, *Hydraulic engineering, *South Dakota, Dam failure, Concrete dams, Rupturing, Reservoirs, Water levels, Pumping, Water pressure, Costs, Flood protection.
Identifiers: *Dam demolition, *Ft. Meade Dam (S Dak).

A portion of a flood-weakened concrete and masonry dam was deliberately demolished by explosives in June 1972 near Rapid City, South Dakota. The demolition was carried out to forestall the possibility of the dam's collapse in the event of renewed flooding during the period of devastating floods in Rapid City. An 80- x 25-ft segment on the left abutment was cleanly removed by 3000 lb of explosives. The portion to be removed was outlined by explosively loaded 2-in. diameter holes on 1-ft centers, the reinforced concrete panels were broken up by seven 150-lb surface charges, and the broken material was ejected by a 1700-lb cratering charge emplaced in a cavity in the dam. All explosives were detonated simultaneously. The first step taken at the scene was to install several pumps to lower the water level, relieving the pressure on the dam. The work was accomplished in 4 days at a cost of perhaps $10,000 and would have required a month and perhaps as much as $50,000 if attempted with conventional construction equipment. (Woodard-USGS)

8I. Fisheries Engineering

EVALUATION OF COMMERCIAL FISHERY POTENTIAL OF WISCONSIN'S BOUNDARY WATERS OF LAKE SUPERIOR-WALLEYE,
Wisconsin Dept. of Natural Resources, Madison.
B. Belonger, and R. Poff.
Available from NTIS, Springfield, Va 22151 as COM-72-11165 Price $3.00 printed copy; $1.45 microfiche. Completion Report for NOAA, National Marine Fisheries Service, May 1971. 15 p, 10 fig, 4 tab. NOAA AFC-8.

Descriptors: *Fish population, *Walleye, *Wisconsin, Rivers, *Lake Superior, Tributaries, Fish migration, Census, Growth rates, Fish management, Tagging, Life cycles, Biology, Age, Ecology.
Identifiers: Chequamegon Bay (Wisc.), Iron River (Wisc.), Bad River (Wisc.).

Two areas of walleye fish concentration in western Lake Superior (Chequamegon Bay-Bad River, and Superior-Iron River) were sampled. Mark and recapture methods were employed to assess migration, growth, and exploitation of their populations. The walleye population in the western Lake Superior study area has low commercial fishery potential because of the present sport fishery, the slow growth rate, and the long

life span. Gill nets were lifted for 31 days with all fishing done during one-night outsets. The total catch was 858 walleye (including 12 tag returns--most of which were recaptured at or very near the point of tagging and within 5 days of tagging). Walleye size ranged in total length from 6.3 to 27.7 inches with 19.2 inches the median size for these fish captured in gill nets. Size distribution placed 93% of the walleye in the range of 17.0 to 21.9 inches. (Woodard-USGS)

THE ZOOPLANKTON OF A CARP POND UNDER CONDITIONS OF CONTINUOUS FILLING,
Polish Academy of Sciences, Krakow. Zaklad Biologii Wod.
L. Krzeczkowska-Woloszyn.
Acta Hydrobiol. Vol 14, No 3, p 307-315, 1972, Illus.
Identifiers: *Carp farms, Plankton, *Poland (Golysz), Ponds, *Zooplankton.

The effect of several years' filling of fish pond in Golysz (Cieszyn district) on the development of zooplankton was investigated. Seasonal variations and the influence of the fish stock on the quantity and qualitative composition of zooplankton are also discussed. The most intensive development of zooplankton was found in the first yr of the investigations, due to the first filling and utilization of the pond after its renovation. Permanent filling of the pond in the following years resulted in decreased amounts of zooplankton.--Copyright 1973, Biological Abstracts, Inc.

FRAZER LAKE SOCKEYE INVESTIGATIONS, 1970,
Alaska Dept. of Fish and Game, Kodiak. Research Section.
P. A. Russell.
Available from the National Technical Information Service as COM-73-10238. Alaska Department of Fish and Game Informational Leaflet No. 159, September 1972. 83 p, 32 fig, 15 tab, 11 ref, 11 append. 14-17-0005-222.

Descriptors: *Fish migration, *Spawning, *Alaska, Timing, Smolt, Age, Fish management, Productivity, Fish reproduction, Fish establishment, Fish passages, Life history studies.
Identifiers: *Frazer Lake (Alaska), Kodiak (Alaska).

Research to assess the sockeye run at Frazer Lake, Kodiak Island, Alaska, from 1965 to 1970 is described. Smolt age composition in 1970 was 0.3% age 3.0, 31.6% age 2.0, 68.1% age 1.0 and 0.02% age 0.0. In 1970, age 0.0 smolt averaged 113 mm and 12 grams; age 1.0 smolt averaged 149 mm and 31 grams; age 2.0 smolt 180 mm and 54 grams; age 3.0 smolt 193 mm and 64 grams. Sockeye freshwater survival from potential egg deposition to smolt indicates an overall median value for survival rate as about 0.70%. Smolt length frequency analysis provided a quantitative method of determining length distribution parameters usable in conjunction with scale reading to infer age composition of smolt outmigrations. Pilot echo sounding studies showed diurnal migration patterns of yound sockeye. The number of sockeye entering Frazer Lake since 1956 has shown an increase with a peak return of 24,081 in 1970. Increase in sockeye spawner survival occurred in 1970 resulting from improved fishpass efficiency due to modifications and temporary lead construction. Limnological investigations included outlet temperatures and lake temperature profiles, plankton analysis, and a profile map of Frazer Lake. (Jones-Wisconsin)

MILL CREEK FISH PASSAGE FACILITY,
Washington State Dept. of Fisheries, Olympia.
R. W. Kramer.
Available from NTIS, Springfield, Va., 22151 as COM-72-11081 Price $3.00 printed copy; $1.45 microfiche. Completion Report to NOAA, National Marine Fisheries Service, September 1970. 5 p, 6 photo. AFC-32.

Descriptors: *Fish passages, *Salmon, *Hydraulic structures, *Fish migration, *Washington, Anadromous fish, Fish establishment, Fisheries, Fish reproduction, Spawning, Fish management, Waterfalls.
Identifiers: *Clallam County (Wash).

A fish passage facility was constructed through a falls in Mill Creek in Clallam County, Washington, in 1970 to open up 5 miles of spawning and nursery areas to coho salmon. Records of hatchery planting show that no salmon have been stocked in Mill Creek. In the summer of 1969, approximately 9 to 10 thousand coho fingerlings were salvaged from an adjacent dry stream channel and placed in this stream at several sites. Stocking of Mill Creek with coho salmon is anticipated to make use of the newly opened stream area. No chinook or other species of salmon are considered to be reared in this stream watershed. TRANSFER OF WATER RESOURCES KNOWLEDGE.

Proceedings of the 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado, E. Vlachos, Editor: Water Resources Publications, Fort Collins, 1973. 540 p.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries.

The conference on Transfer of Water Resource Knowledge used a two-fold approach to aspects of transfer: the transfer of knowledge from

developed to developing countries; and the transfer of knowledge from research to practice. The collection of papers raises major points about the overall process of communicating and transferring knowledge and about the important linking mechanisms between transmitters and receivers. More important, it points out important elements of the process such as the source, methods, channels, receiver, and short- and long-range effects of the communicated knowledge. Transfers of knowledge without any other major socioeconomic changes, without deep transformations in the social structure, and without the commitment of professionals to a wider horizon under the specific cultural conditions of each country and region will be exercises in futility, abortive transplants, and continuous sources of frustration for well meaning technologists. ECONOMIC ANALYSIS AND MUNICIPAL WATER SUPPLY IN DEVELOPING COUNTRIES,
International Bank for Reconstruction and Development, Washington, D.C.
J. J. Warford, and P. W. Whitford.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972. Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 40-51, 1973. 2 ref.

Descriptors: *Information exchange, *Water supply, *Municipal water, *Water management (Applied), *Economics, Social aspects, Cost-benefit analysis, Legal aspects, Research and development, Cost-benefit theory, Technology.
Identifiers: *Technology transfer, *Developing countries.

Some of the difficulties involved in applying economic theory to the practical problems faced by municipal water supply authorities are discussed with particular reference to conditions in developing countries. Basic economic principles are so crucial and so relevant to this field that there is ample scope to adapt theory to suit the practical circumstances of the water-supply industry, and compromise solutions can be reached that are likely to yield considerable benefits. The problem is to use economics in a way that is palatable to the industry. Pricing and investment policies; principles and problems of implementing marginal cost pricing; the roles of benefit-cost analysis and shadow pricing in project design, selection, and construction; unemployment and acute foreign exchange problems that are typical of developing countries; and the political, institutional, and social barriers to the adoption of economically efficient pricing and investment rules are discussed. W74-00190

RESEARCH IMPLEMENTATION, A COORDINATED APPROACH,
Utah Water Research Lab., Logan.
J. M. Bagley, J. P. Riley, and D. F. Laurence.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 52-59, 1973. 1 fig.

Descriptors: *Information exchange, *Research and development, *Water resources, Planning, Universities, Research priorities, Technology, *Coordination.
Identifiers: *Technology transfer, *Information exchange.

Ideally, research and practice are linked by two-way information channels which convey research needs, or user problems, to the scientist and research knowledge to the user. Without well developed linkage channels, research programs tend to be fragmented and inconsistent with user needs, while users fail to apply currently available knowledge to meet the problems which they face. Some of the problems associated with the effective two-way flow of information between the research and practice regions and possible techniques for implementing this flow are discussed. Recommendations are given for the improvement of communication. There has apparently been a tendency in the past to treat research, practice, and linkage as independent entities rather than as an integrated system which provides for the effective flow of information within the system as a whole. W74-00191

WATER RESOURCES SCIENTIFIC AND TECHNICAL INFORMATION DISPLAY, STORAGE, AND RETRIEVAL,
Office of Water Resources Research, Washington, D.C. Water Resources Scientific Information Center.
R. A. Jensen.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 60-70, 1973. 5 fig, 4 ref.

Descriptors: *Abstracts, *Bibliographies, *Data processing, *Information exchange, Documentation, Data collections, Information retrieval, Federal Government, Research and development, Publications, Water resources institute, Water resources Research Act, Digital computers, Computer programs.
Identifiers: *Technology transfer, *Water Resources Scientific Information Center, Office of Water Resources Research.

Information storage and retrieval activities currently being conducted by the Water Resources Scientific Information Center of the Office of Water Resources Research in the U.S. Department of the Interior are described. University water resources research groups are used as input centers to convert information collected in performing their own research to a common format which, when merged, forms a comprehensive and searchable information base. The general information processing system (GIPSY) is used by the prototype network, with terminals at the University of Wisconsin, Cornell University, and The University of North Carolina. GIPSY is a search program plus a set of utility programs which operate in batch or tele-processing mode from remote terminals. GIPSY operates in the online reactive mode, and can be used for generating topical bibliographies. (See also W74-00189) (Knapp-USGS)
W74-00192

THE INFORMATION SCIENCE APPROACH TO TRANSFER OF KNOWLEDGE,
Bureau of Reclamation, Denver, Colo. Engineering Reference Branch.
W. B. McBirney.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 71-79, 1973.

Descriptors: *Abstracts, *Bibliographies, *Data processing, *Information exchange, Documentation, Data collections, Information retrieval, Federal Government, Research and development, Publications, Digital computers, Computer programs.
Identifiers: *Technology transfer, *Bureau of Reclamation, *Information science.

The information science approach to facilitating the transfer of knowledge is discussed in general terms. Use of abstract bulletins, selective dissemination of information, bibliographies, state-of-the-art reviews, microforms, and retrieval are reviewed. The operational scientific information program of the Bureau of Reclamation is described in its application of the computer for dissemination and retrieval. A brief view is given of feasible methods for providing scientific information to developing countries as compared to more modern societies. (See also W74-00189) (Knapp-USGS)

TRANSMITTING WATER RESOURCES INFORMATION BY A TIME-SHARE SYSTEM,
New Mexico State Univ., University Park.
C. G. Keyes, Jr., and R. T. Telfer.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 80-88, 1973. 5 fig, 5 ref. Bur. of Reclam. 14-06-D-6803.

Descriptors: *Abstracts, *Bibliographies, *Data processing, *Information exchange, Documentation, Data collections, Information retrieval, Federal government, Research and development, Publications, Digital computers, Computer programs.
Identifiers: *Technology transfer, Time-share computers.

A time-share computer system may be used to transmit water resources information. The basic system consists of a central processing unit, terminal locations, input data locations, and output data locations or users. The system could be expanded to include real-time forecasting or design in any atmospheric water resources program. (See also W74-00189) (Knapp-USGS)
W74-00194

DEVELOPING A COOPERATIVE RESEARCH PROGRAM FOR FLOOD CONTROL IN BRAHMAPUTRA VALLEY,
Brahmaputra Flood Control Commission (India).
S. N. Gupta.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 98-109, 1973. 3 fig.

Descriptors: *Information exchange, *Flood control, Floods, Model studies, Braiding, Mathematical models, Sediment transport.
Identifiers: *Technology transfer, *Assam.

The Brahmaputra River in the northeastern region of India causes flood and erosion problems. The Government of Assam created a Flood Control Commission in July 1970 to study flood problems of the valley and prepare a master plan for flood control. A comprehensive cooperative research program is being planned by Hydrology Directorate of Central Water and Power Commission, India, and Hydrology and Water Resources Wing of Colorado State University, Fort Collins, to study the problems. The availability of high speed computers of large capacity makes it possible to simulate the performance of relatively complex river basin systems for periods of any desired length. Design, construction, and operation of a mathematical model for Brahmaputra basin will provide a tool for the study of complex flood phenomena in the valley. It will also depict how

river training measures should be devised to least interfere with the channel regime and, at the same time, control bank erosion. Study of hydrology of Brahmaputra River is a suitable subject for cooperative research. (See also W74-00189) (Knapp-USGS)
W74-00195

APPLICATION OF HYDROGEOLOGICAL DATA TO LONG-TERM ECONOMICS OF GROWING SUGAR CANE IN VENEZUELA,
Water Development Corp., Tuscon, Ariz.
L. C. Halpenny, and A. Dupuy.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 110-115, 1973. 1 fig.

Descriptors: *Information exchange, *Irrigation practices, *Withdrawal, *Conjunctive use, Sugarcane, Economics, Water yield.
Identifiers: *Technology transfer, *Venezuela.

Transfer of hydrogeological knowledge from research to practice and from developed to developing regions has been successfully achieved beginning in 1959 under a cooperative effort between consulting hydrologists and sugar cane growers in Venezuela. The program was begun by Central El Palmar within the area drained by Rio Aragua in the State of Aragua, Venezuela. The area is intensively farmed with irrigated agriculture, of which a substantial portion is sugar cane. The water supply for irrigation is obtained partly from stored surface-water runoff and partly by pumping wells. The initial objective of the program was to detect changes in groundwater levels from which predictions could be developed as to whether or not the groundwater system was being overdeveloped. This early warning system indicated in 1962 that Tocoron subarea in Aragua State was being overdeveloped, and arrangements were made to reduce pumping and to divert more surface water to the area. Evaluation of water-supply data made it possible to refine the consumptive use calculations for planning future irrigations. Optimum cane yield results when 200 cubic meters of total water supply is available for each metric ton of cane produced. (See also W74-00189) (Knapp-USGS)

PUERTO RICO: A CASE STUDY OF WATER RESOURCE TECHNOLOGY TRANSFER,
Puerto Rico Dept. of Public Works, San Juan. Area of Natural Resources.
W. E. Nothdurft.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 116-124, 1973. 3 ref.

Descriptors: *Information exchange, *Water resources development, *Puerto Rico, Water management (Applied), Planning, Urbanization, Government, Social aspects, Political aspects, Flood protection, Dams, Reservoirs.
Identifiers: *Technology transfer.

The transfer of water resources knowledge from developed to developing areas involves transfers from point to point within a given system or institutional management structure, and transfers from some external source into a given system or institutional management structure. The theoretical framework of these transfers and the barriers to their efficient functioning in the water resource management institutional structure of one developing area, the Commonwealth of Puerto Rico, is discussed. Barriers, or inefficiencies, in intrasystem transfers are closely related to the level of managerial sophistication in the institutional structure. On the other hand, inefficiencies in intersystem transfers can generally be attributed to institutional inflexibility on the part of either the transfer recipient (as is generally the case), the transfer source, or both; and the incapacity of the recipient system to absorb new inputs. (See also W74-00189) (Knapp-USGS)
W74-00197

TRANSFER OF KNOWLEDGE IN WATER RESOURCES FROM RESEARCH TO PRACTICE,
European Economic Commission, Geneva (Switzerland). Environment Div.
A. D. Pobedimsky.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 125-131, 1973.

Descriptors: *Information exchange, *Europe, *United Nations, Conferences, Education, Water management (Applied), Research and development.
Identifiers: *Technology transfer.

The purpose is to describe how an international organization (the UN Economic Commission for Europe) transfers knowledge in the field of water resources from research to practice. Emphasis is placed on the pooling of international experience in the field of water resources development and water quality problems, on studies and seminars in this field, and on the transferring of national experience through systematic circulation of technical information. Suggestions are also offered as to the efficient transferral of knowledge by international organizations and the eventual use in national practices. (See also W74-00189) (Knapp-USGS)
W74-00198

THE ROLE OF THE INTERNATIONAL COMMISSION ON IRRIGATION AND DRAINAGE IN THE TRANSFER OF WATER RESOURCES KNOWLEDGE,
Bureau of Reclamation, Denver, Colo. Technical Services Branch.
L. D. Stephens.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 132-142, 1973.

Descriptors: *Information exchange, *Irrigation, *Drainage, Water management (Applied), International Commissions.
Identifiers: *Technology transfer, *International Commission on Irrigation and Drainage.

The International Commission on Irrigation and Drainage provides a forum for the development of the sciences and techniques of irrigation engineering, flood control, and river training. The role of the Commission in transferring water resources knowledge in these areas from research to practice and from developed to developing countries is discussed. Activities of the Commission are described, and currently available publications are summarized. (See also W74-00189) (Knapp-USGS)

HOW ENGINEERING RESEARCH IS REDUCED TO PRACTICE IN THE BUREAU OF RECLAMATION,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
H. J. Cohan, and W. P. Simmons.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 148-154, 1973.

Descriptors: *Research and development, *Information exchange, *Water resources development, Hydrology, Dams, Irrigation, Reservoirs.
Identifiers: *Bureau of Reclamation, *Technology transfer.

The Bureau of Reclamation and its activities, how research needs are identified, and how planning and engineering research is organized and carried out to satisfy those needs are described. How research results are transferred into practice is shown by case histories. The continuing search for improvements in ways of transferring research results into practice, and the present status of techniques being utilized are described. The importance of 2-way communication and feedback is stressed. (See also W74-00189) (Knapp-USGS)

RESEARCH FINDINGS AND THE DESIGN ENGINEER,
Auburn Univ., Ala.
C. H. Harrison.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 155-161, 1973. 5 ref.

Descriptors: *Information exchange, *Bibliographies, *Publications, *Engineering, Water resources development.
Identifiers: *Technology transfer.

An engineer with a design problem will attempt to locate information either by consultng a colleague or by reference to an index. The Cumulative Index to ASCE Publications is suggested as a good starting point. More recent research findings can often be obtained by phoning or writing the author of an article appearing in an ASCE journal or by contacting a researcher listed in the Water Resources Research Catalog. Where the Citation Index is available, more recent publications on a given subject can be quickly located by using ASCE publications as a starting point. Abstracts alone are of little value to a design engineer. The design engineer's need for immediate reference material places a large responsibility on the reviewers of the major technical journals. These reviewers should also pay attention to the quality of the reference supplied with a technical paper because of the increasing use of the Citation Index. (See also W74-00189) (Knapp-USGS)
W74-00201

TECHNICAL AID FOR HYDROLOGIC STUDIES IN SPANISH-SPEAKING COUNTRIES,
Geological Survey, Lakeland, Colo.
O. J. Taylor.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p. 162-166, 1973.

Descriptors: *Information exchange, *Foreign projects, Hydrology, Computer programs, Mathematical models, Hydrogeology.
Identifiers: *Technology transfer, *Chile, *Canary Islands.

Recent technical aid for hydrologic studies in Chile, the Canary Islands, and Spain emphasized the necessity for communication in various specialties. The projects included design and in-

terpretation of digital-computer simulation models for a stream-aquifer system in central Chile and preparation of computer programs for the processing of chemical data from the Canary Islands. The results of studies published by the various countries showed that the technical assistance was effective. The success of the technical aid was strongly dependent on communication with Spanish-speaking hydrologists in mathematics, computer science, hydrology, and related technologies. Failure to communicate in technical specialties may easily lead to misunderstanding of problems, misleading results, or completely erroneous results. (See also W74-00189) (Knapp-USGS)
W74-00202

THE ROLE OF PROFESSIONAL SOCIETIES IN THE DISSEMINATION OF WATER RESOURCES RESEARCH INFORMATION,
American Society of Civil Engineers, New York. Research services.
D. C. Taylor.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 167-185, 1973. 12 ref, 2 append.

Descriptors: *Information exchange, *Professional societies, *Technical societies, Publications, Conferences, Documentation, Abstracts, Information retrieval, Data collections.
Identifiers: *Technology transfer.

Professional societies, because of the nature of their membership, have a major role to play in the interpretation and dissemination of research information to their members for practical use. In few other ways are the members of the profession brought together so closely on technical and professional issues. Traditional methods of disseminating information by professional societies are still very effective and include conference symposia, technical magazines and journals, and meetings. There are also trends toward providing easier ways for busy professionals to locate and put to use relevant information such as the use of information storage and retrieval systems and publication of state of the art studies. Research-in-progress surveys and research needs studies help link research as well as make it relevant to practice. New and expanding continuing education services bring new information to members faster. (See also W74-00189) (Knapp-USGS)

THE WATER RESOURCES INFORMATION PROGRAM AT THE UNIVERSITY OF WISCONSIN,
Wisconsin Univ., Madison. Water Resources Center.
L. G. Zweifel, J. R. Luedtke, and J. E. Kerrigan.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 186-198, 1973.

Descriptors: *Wisconsin, *Abstracts, *Bibliographies, *Data processing, *Information exchange, Documentation, Data collections, Information retrieval, Federal Government, Research and development, Publications, Water resources institute, Water Resources Research Act, Digital computers, Computer programs.
Identifiers: *Technology transfer, *Water Resources Scientific Information Center.

The rapid growth of scientific information coupled with an increasing need to correlate diverse kinds of information in specialized research led to the development of information exchange and technology transfer systems. The establishment of the Water Resources Information Program at the University of Wisconsin was facilitated by the prior existence of several smaller information programs. These individual elements were consolidated to respond effectively to the needs of the information transfer activity. The information role of the Water Reources Center was expanded in 1968 when it was designated a center of competence in the field of eutrophication by the Water Resources Scientific Information Center of the Office of Water Resources Research. The Center identifies significant literature and submits abstracts for the OWRR'S semimonthly publication, Selected Water Resources Abstracts. The grant enables the information program to broaden its literature search capabilities, increase the number of abstracts, publish specific reviews of the literature, and distribute copies of abstracts to scientists and librarians throughout the world. A computer network provides terminal services to the water resources community in a 21-state western region for literature searches for technical and research projects. W74-00204

EUTROPHICATION RESEARCH APPLIED TO WATER QUALITY MANAGEMENT ON THE GREAT LAKES,
Department of the Environment, Burlington (Ontario). Centre for Inland Waters.
A. R. LeFeuvre, and J. P. Bruce.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 199-210, 1973. 1 fig, 11 ref.

Descriptors: *Information exchange, *Eutrophication, *Great Lakes, Canada, International Joint Commission, Lake Erie, Lake Ontario, Data collections, Water quality control, Water management (Applied).
Identifiers: *Technology transfer.

The eutrophication control program and negotiation of the Great Lakes Water Quality Agreement are excellent examples of a situation in which research results were quickly and effectively used in development of public policies and had a profound impact on these policies. The ingredients of this successful and rapid transfer of research findings to action programs are (1) an effective mechanism to mobilize both scientific and management manpower, (2) a procedure for public and media involvement in formulation of recommendations, (3) governmental organizations that have research activities built into the management responsibility structure, and (4) a deliberate commitment of highly qualified manpower to help the transfer and conversion process. WATER RESOURCES DEVELOPMENT POLICIES AND TRANSFER OF KNOWLEDGE FROM DEVELOPED TO DEVELOPING COUNTRIES,
Tahal Consulting Engineering Ltd., Tel Aviv (Israel).
A. Wiener.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 237-245, 1973.

Descriptors: *Information exchange, *Foreign projects, *Water resources development, *Water management (Applied), International commissions, Irrigation.
Identifiers: *Technology transfer, *Developing countries.

A meaningful study of the transfer from developed to developing countries of information, know-how, and technology relating to water resources has to consider not merely water as an isolated resource, but the whole complementary complex that is relevant to its use. Water is either an infrastructural feature, as it is in community and many industrial water supplies, or a production input, as it is in irrigation or in the wet industries. In both modes of water use the transfer of information ought not be confined to the resources aspects alone, but should also include economic, social, institutional, and political aspects. For projects to be effective in developing countries, they would have to include not only the physical infrastructural features from projects in developed countries, but also the elements connected with overcoming the inadequacy of underdevelopment, such as the lack of capacity to spontaneously produce the necessary transformation relating to rural organization, motivation, and information transfer down to the production level. W74-00206

WATER RESOURCES UTILIZATION IN DEVELOPING COUNTRIES,
Universidad Central de Venezuela, Caracas.
L. E. Franceschi.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 246-251, 1973.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries.

Basically, a water plan for a developing country should provide the necessary foresight to the decision making process, so that decisions are made with an awareness of their consequences, under priority preferences for solving the multiple, interrelated problems to be encounted. This calls for identifying the problem areas associated with water; assessing water problems, water availability and related land use conflicts; and preparing a plan that considers several planning stages differing in detail and precision but within the same orientation scope. Planning the use of a scarce resource is a permanent and continuous process in which the master plan encompassing the other stages is the most important instrument for any developing country. To assess water associated problems and formulate the plan, the most important tool is the water balance which is used to make logical allocation of the available water among potential users of a hydrographic unit in which several basins may be grouped. OBSTACLES TO CONSIDERATION OF RESOURCES MANAGEMENT ALTERNATIVES: SOUTH ASIAN EXPERIENCE,
D. U. Hewapathirane, and G. F. White.
In: Transfer of Water Resources Knowledge; Procedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 252-261, 1973. 35 ref.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries, *Sri Lanka (Ceylon).

One of the principal reasons for ineffective water management measures in developing countries is the failure of planning agencies (both consulting firms and government offices) to give consideration to alternatives to conventional techniques. As a result, some works fail to meet their social goals or have the opposite effects, and the less conventional techniques are neglected. Experience with river management programs in Sri Lanka (Ceylon) and the Lower Mekong Basin illustrate these points. Failure stems in large part from the method of training professional personnel and from the rigid definition of administrative missions for government agencies. Neither of these conditions is susceptible to early or easy correction. However, it is likely that partial remedy could be obtained rather readily at low cost by a combination of two activities: (1) adoption of a criterion that examination of alternatives should be an integral part of review of project proposals by multilateral and bilateral financial agencies, and (2) short-term training for principal technical personnel. TRANSFER OF WATER RESOURCES KNOWLEDGE FROM DEVELOPED TO DEVELOPING REGIONS OF THE WORLD,
Engineering Science, Inc., Berkeley, Calif., and Engineering Science, Inc., McLean, Va. International Div.
F. L. Hotes.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 262-269, 1973.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries.

In working in developing countries, primarily in water resources and agricultural development, knowledge of specialized mechanical skills, as well as that of the physical and social sciences, must be transferred. The transfer process is not complete until the developing nation has an active, permanent reservoir of water resources knowledge. Examples are given of problems stemming from the attitudes and traditions of both expatriate experts and developing country nationals. Oversophisticated methods inapplicable in most developing countries should not be taught intensively. If methods are conceived with the aid of people in such countries and executed in the developing world as frequently as possible, they should produce better results. (See also W74-00189) (Knapp-USGS)
W74-00209

KNOWLEDGE TRANSFER,
Utah State Univ., Logan. International Programs and Studies.
B. H. Anderson.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 270-279, 1973.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries.

United States universities and colleges will be involved in the education of foreign students for some time. The mechanisms or techniques of knowledge transfer and the kinds of problems that impede the process are discussed. For universities wanting to accomodate the real needs of foreign students, ideas and innovations in training are discussed. Emphasis is given to special short courses which can provide excellent opportunities for practical training programs. Properly planned courses can provide excellent knowledge transfer opportunities. However, this raises the question of the excellent knowledge transfer opportunities. However, this raises the question of the role to be played by various agencies and suggests that a new mechanism be found allowing a more direct approach between institutions involved in knowledge transfer. A CASE ON TRANSFER OF KNOWLEDGE IN WATER RESOURCES SYSTEMS PLANNING FROM A DEVELOPED REGION TO A DEVELOPING ONE, AND FROM RESEARCH TO APPLICATION,
Chile Univ., Santiago. Faculty of Physical and Mathematical Sciences.
J. A. Poblete, and R. Harboe.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 280-293, 1973. 36 ref.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries.

A brief description of a process of transfer of knowledge from one region to another and from research to application in the area of Water Resources Systems Planning is given. This description is based on the experience gained by the Centro de Planeamiento (CEPLA), a center of applied research and teaching in planning and economics at the School of Engineering of the University of Chile (UCH), over a period of approximately 10 years. Two interuniversity programs, one between the Department of Civil Engineering of the Massachusetts Institute of Technology (MIT) and CEPLA, and the other from the Water Resources Planning Group at the University of California, Los Angeles, (UCLA) and CEPLA, are described. A prolonged professional working seminar and two applied research projects are discussed. These activities have been designed by CEPLA as a means of transfer of knowledge from research to application. A working seminar for professionals, extended over a prolonged period of time and organized at a university, is successful and is a neutral ground for discussion among specialists of the conflicting aspects which characterize the water resources problems. It also provides an opportunity to present to professionals some of the relevant applied research projects that are being developed at universities and foreign countries. Applied research projects and the training of professionals and students who participate as technical staff in those projects is a promising vehicle of transfer from research to application. RESEARCH AND EDUCATION FOR DEVELOPMENT,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
M. L. Albertson, and M. T. Chaudhry.
In: Transfer of Water Resources Knowledge, Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 294-306, 1973. 3 fig, 18 ref.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries.

Progress in developing countries requires plans, programs, manpower, and institutional resources. Manpower and resources are the result of education, training, and experience, while the basic informational resources for plans and programs come from research and study. Literature on development should be expanded and made available to the people. Participation of people from the less developed countries should be increased. This means more students and participants in seminars and discussion groups. Documentary films of lectures of the outstanding professors on various topics related to development should be prepared and made available to students and working people. Stronger and more extensive links should be established between universities and development agencies. Programs of research should be initiated to study the sociology of the educated, to determine their value, attitudes, and difficulties as they reflect on the development process. A research program should be started, and education should be spread on establishing democratic developmental institutions, which should replace existing authoritative structures. W74-00212

VENEZUELAN EXPERIENCE ON THE TRANSFER OF KNOWLEDGE IN WATER RESOURCES ENGINEERING,
Universidad Central de Venezuela, Caracas.
J. N. Aceituno, and J. I. Sanabria.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 321-327, 1973. 1 fig, 1 tab.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspect, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries, *Venezuela.

The mechanics of transfer knowledge and the path followed in Venezuela were studied in order to bring out the difficulties of the actual system and search for recommendations which permit the increase of efficiency of such transfer. Subjects surveyed were engineers in some of the fields of hydraulic resources engineering. Experience from developed areas is the main source of information of engineers involved in project activities. Local experiences are mainly used by engineers working on planning of water resources. Information is generally obtained by means of books and journals of professional societies. The lowest-percentage path followed by the knowledge corresponds to a personal contact with members of research institutions and universities. Engineers involved in planning activities reported the nonapplication of some techniques because of the quality and range of data required. There is a trend among publications from developed areas to be more scientific than practical. Thus publications are becoming a limited source of information for developing areas due to the character of their specialized problems. A typical example is research in the fields of

scour; many laboratory studies have been realized, but few fields measurements are reported. Periodical meetings, seminars, and short courses are good means of making personal contacts and effecting interchange of knowledge. (See also W74-00189) (Knapp-USGS)
W74-00213

ACHIEVEMENTS OF INDIA IN THE FIELD OF WATER RESOURCES DEVELOPMENT,
Central Water and Power Commission, New Delhi (India).
S. K. Jain.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 328-333, 1973, 1 tab.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries, *India.

In assessing water resources and the efforts for planning in India, emphasis is placed not only on structures and design, but also on the management and operation of various projects. Knowledge gained through such organizations as the Water and Power Development Consultancy Services as well as a multitude of other state agencies can be made available to other developing nations and, thus, contribute to the needed continuous transferal of experience. W74-00214

EXPERIENCE OF THE U.S. GEOLOGICAL SURVEY IN TRANSFER OF HYDROLOGIC KNOWLEDGE TO THE DEVELOPING COUNTRIES,
Geological Survey, Washington, D.C. Office of International Activities.
G. C. Taylor, Jr.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 334-344, 1973. 4 tab.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries, *U.S. Geological Survey.

The U.S. Geological (USGS) has participated in overseas technical assistance programs for more than 30 years. Between 1940 and 1970 USGS water scientists and engineers completed 347 project oriented assignments in 80 host countries. During the same period 426 water scientists, engineers, and technicians from 61 countries received academic and inservice training through USGS facilities in the United States. Training is a basic ingredient of the institution building process. Technical competence, adaptability to host country constraints, and personal sympathy with host country needs and aims are important qualities in the USGS specialist on foreign assignment. Most important to successful technical assistance is the provision of qualified local individuals for training as well as leadership and administrative support. Continuity of relationship between the USGS and its host country counterpart has been found to be the single most important factor contributing to the growth of a viable water-resources organization over a period of years. (See also W74-00189) (Knapp-USGS)
W74-00215

SOME PROBLEMS ASSOCIATED WITH THE USE OF FOREIGN ADVISORS IN DEVELOPING COUNTRIES,
Colorado State Univ., Fort Collins. Dept. of Mechanical Engineering.
W. W. Shaner.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 345-355, 1973.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries.

Many developing countries in the early stages of economic development and planning have to rely on foreign organizations and advisors. This reliance is likely to continue until sufficient time has lapsed to permit the country to develop its institutions and train its own specialists and administrators. However, making good use of foreign technology involves a number of problems, many of which are only discovered through living and working in such countries. These problems involve the promoters, the biased, the impossible, the irrelevant, the confusion, the out of place, the sophisticates, the vacationers, and the old timers. Better knowledge of these problems followed by appropriate action should lead to an easier and more efficient transfer of technology between the developed and the developing countries. (See also W74-00189) (Knapp-USGS)
W74-00216

TRANSFER OF KNOWLEDGE IN WATER RESOURCES FROM DEVELOPED TO DEVELOPING REGIONS WITH SPECIAL REFERENCE TO THE CONDITIONS OF WEST PAKISTAN,
Ministry of Finance, Planning and Development, Islamabad (Pakistan). Div. of Water Resources.
S. K. Malik.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 356-365, 1973. 1 fig, 2 tab.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries, *West Pakistan.

The main problems of water resources development in West Pakistan, especially the major works undertaken in the Indus River Basin, are discussed. In the context of these works the role of foreign advisers, consultants, and contractors from developed countries is discussed, and the successes and failures of such a cooperation are juxtaposed. From past experience proposals for the future include the acquainting of foreign experts with local circumstances, raising of the level of technical expertise, and a broader understanding of the socioeconomic million within which development takes place. DEVELOPMENT OF MATHEMATICAL MODELING CAPABILITIES FOR THE VISTULA RIVER PROJECT, POLAND,
Water Resources Engineers, Inc., Walnut Creek, Calif.
G. T. Orlob, I. P. King, and D. F. Kibler.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 384-392, 1973. 1 fig, 2 ref.

Descriptors: *Information exchange, *Mathematical models, *Systems analysis, *Water resources development, Water supply, Optimization, Education, Training.
Identifiers: *Technology transfer, *Poland.

Under sponsorship of the United Nations Development Program, Poland performed a study of alternative plans for the optimal utilization of the Vistula River System, the country's primary water resource. An important element of the study involved training of Polish engineers in mathematical modeling techniques already in use in the United States and the transfer of this knowledge through a working team to facilitate development and application of models in Poland. A high degree of rapport and mutual respect for technical competence of model team participants was developed. Substantial advances in the mathematical modeling art were made, especially in the development and refinement of the One-Step Water Resources Allocation Model, VISSIM. Other notable contributions were in the development of a versatile power optimization program by the Polish team and the initial application of a stream temperature model to the Vistula River System. As an exercise in the interchange of water resources planning knowledge, the experience was rewarding to all. (See also W74-00189) (Knapp-USGS)

METHODS OF TRANSFER OF WATER RESOURCES KNOWLEDGE FROM DEVELOPED TO DEVELOPING REGIONS WITH SPECIAL EMPHASIS TO ON-FARM WATER MANAGEMENT,
Agency for International Development, Washington, D.C. Office of Agriculture and Fisheries.
O. J. Kelley.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 393-406, 1973. 1 ref.

Descriptors: *Information exchange, *Planning, *Water resources development, *Farms, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data, Irrigation water, Groundwater, Soil water.
Identifiers: *Technology transfer, *Developing countries.

There is no single direct transfer of knowledge and technology from the developed to the developing country. In farm water management, the ultimate target of any knowledge transfer is the individual farmer, for it is on the farm land where the production resources are all integrated into an agricultural production system. In order to reach the farmer it is often necessary to train farm advisors, system operators, and administrators, and to develop production processes and institutions. Markets provide a direct contact with the farmer and are of great importance as a mechanism for knowledge transfer. Modern on-farm water management technology in developed countries is highly capital-intensive, highly energy intensive, and has a low labor requirement. In developing countries such as India and Pakistan, the energy simply is

not available; likewise capital is very scarce and labor is abundant. Modern systems which are fully automatic would, therefore, have only limited application in such countries. A particular advantage of modern water technology is the advantage of the built-in decisions that a well designed system has for correct water application. A well designed modern system has a considerable amount of management built into it, and the farmer is automatically led to the correct decision in the application of water to his land. GUIDELINES FOR TRANSFER OF PRACTICE TO APPLICATIONS FOR OPTIMUM ON PLANNING OF KEY ITEMS OF WATER RESOURCE PROJECTS,
Madhya Pradesh Government Control Board for Major Projects, Bhopal (India).
D. R. Sikka.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Knowledge, Fort Collins, p 407-413, 1973.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries.

In water projects in developing countries, the greatest bottleneck is the absence of an overall body for investigating, planning, construction, and management. Free flow and exchange of useful scientific data between private and public organizations rather than compartmentalization is also essential. It is desirable to prescribe suitable norms and criteria for a program of transfer of knowledge on Water Resources Projects. There is urgent need for international standardization of data from the practical and construction point of view. The classification, if done by collecting data on all the sizable dams constructed all over the world, would allow useful knowledge derived from practical results to be diverted for use elsewhere. NEW FRONTIERS IN DRAINAGE AND RECLAMATION ENGINEERING IN THE INDUS PLAINS,
S. K. Mohiuddin Khan.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 414-422, 1973. 5 ref.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries, *West Pakistan.

Drainage and reclamation in West Pakistan involve transfer of knowledge not only from developed countries to developing countries but also from research and local experience to practical implementation in the last two to three decades. Greater success in transfer of knowledge would have been facilitated by adopting intimate association with local experts who know the area and problems, and proper check on consultants of foreign aided projects; restriction on large scale transfer of sophisticated techniques of developed countries to developing countries without thorough analysis of all technical and socioeconomic aspects; seminars and symposia at different stages of investigation planning, project preparation, operation and maintenance; and more thorough post project monitoring and evaluation. AN IHD PROJECT FOR TECHNOLOGY TRANSFER TO DEVELOPING REGIONS,
Hydrologic Engineering Center, Davis, Calif.
E. F. Hawkins.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 438-448, 1973. 2 tab, 5 ref.

Descriptors: *Water resources development, *Information transfer, *Training, Management, Statistical methods, Mathematical studies, Mathematical models, Hydrology, Conferences, *International Hydrological Decade.
Identifiers: *Technology transfer, *U.S. Army Corps of Engineers.

As part of the United States program for the International Hydrologic Decade (IHD), the U.S. Army Corps of Engineers developed a project entitled Hydrologic Engineering Methods for Water Resources Development. The objectives of the project are to develop and test methods suitable for practical applications in hydrologic engineering and to document these methods in a report. Special attention is given to circumstances under which there are deficiencies in the length, accuracy, and general coverage of hydrologic records. A workshop was given to provide engineers engaged in day-to-day planning, design, and operation of water resources projects with a thorough understanding of the application of a comprehensive variety of hydrologic engineering techniques. The workshop is divided into four major areas: (1) fundamental considerations in water resources development; (2) statistical and mathematical techniques for hydrologic engineers; (3) analysis of natural hydrologic systems; and (4) analysis of water resources development. THE ROLE OF FAO IN THE TRANSFER OF WATER RESOURCES KNOWLEDGE TO DEVELOPING REGIONS,
Food and Agriculture Organization of the United Nations, Rome (Italy). Land and Water Development Div.
H. W. Underhill, R. G. Thomas, and D. Salomons.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 449-461, 1973. append.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologica data.
Identifiers: *Technology transfer, *Developing countries, *Food and Agricultural Organization (UN).

The transfer of knowledge is not an end in itself; the end is to benefit mankind. This benefit will only be achieved if the knowledge is suitable, is adequately transmitted to a well motivated recipient, and is correctly applied. Every situation demands a different solution. FAO has wide experience in this sphere. The transfer of knowledge of the right kind and at the right level to be immediately absorbed and applied is the key to development. The choice and preparation of the individuals--those who are to transmit, and those who are to receive and apply the knowledge--are crucial. (See also W74-00189) (Knapp-USGS)
W74-00223

TECHNICAL ACTIVITIES BY FAO IN THE TRANSFER OF WATER RESOURCES KNOWLEDGE TO DEVELOPING REGIONS,
Food and Agriculture Organization of the United Nations, Rome (Italy). Land and Water Development Div.
C. E. Houston, and H. M. Horning.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 462-472, 1973. 1 fig, 7 ref.

Descriptors: *Information exchange, Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries, *Food and Agricultural Organization (UN).

Water must be studied, developed, and used as a single resource. Technical manpower for study and development of water resources in many developing countries is of a high caliber, but as with many developed countries the utilization of the end project is the gap leading to success or failure. FAO is attempting to fill that gap through field projects, seminars, and publications. The first step in this process is to create an awareness with Governments, then with Technical Services, and finally with the water users. The success or failure of the end user determines the success or failure of an irrigation project, not the engineering design and construction. (See also W74-00189) (Knapp-USGS)
W74-00224

TRANSFER OF KNOWLEDGE IN WATER RESOURCES POLICIES FROM DEVELOPED TO DEVELOPING COUNTRIES,
United Nations Water Resources Development Center, New York.
K. Szesztay.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 473-479, 1973. 9 ref, append.

Descriptors: *Information exchange, *Planning, *Water resources development, *Water policy, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries, *United Nations.

There are well developed forms and channels for transferring scientific and technological knowledge in the field of water management. Fields and types of knowledge in which transfer and assistance may be needed depend largely on projected demands and strategies for water resources development and management. Policy formulation is itself, therefore, an important field for consideration by the conference. Possibilities and limitations for transferring knowledge in this sector are discussed in the light of recent United Nations experiences and programs. The selection of the proper level of technology corresponding to future investment capabilities and manpower resources is particularly emphasized. (See also W74-00189) (Knapp-USGS)
W74-00225

TRANSFER OF WATER RESOURCES KNOWLEDGE THROUGH THE UNITED NATIONS TECHNICAL ASSISTANCE ACTIVITIES,
United Nations Water Resources Development Center, New York.
R. E. Dijon.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 480-493, 1973. 1 append.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, Developing countries, *United Nations.

The United Nations provides technical assistance in the field of water resources to many developing countries, especially as an Executing Agency of the United Nations Development Program. Training is provided on an on-the-job basis, as well as through fellowships abroad. Local national conditions have to be considered; what is relevant for temperate regions does not necessarily apply to tropical areas. First priority is to be given to projects which can lead, within a short period of time, to practical results. The human factor is essential; training programs should be adapted to the academic and professional background of the local personnel. More should be done for the dissemination and exchange of information, not only from developed regions to developing regions, but also on a broad regional and international basis. (See also W74-00189) (Knapp-USGS)
W74-00226

RECENT DEVELOPMENT OF HYDROLOGICAL SERVICES IN COLOMBIA,
World Meteorological Organization, Bogota (Colombia).
W. Klohn, and S. Stanescu.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 494-504, 1973. 4 fig, 16 ref.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries, *Colombia.

Hydrological investigation was limited in Colombia until 1968 when a national hydrological and meteorological service was started as a joint project of the Colombian Government, the World Meteorological Organization, and the United Nations Development Program. Technical assistance in hydrology offered by an international team of experts was directed mainly towards hydrometrical network design and construction of the stations, personnel training on hydrological techniques, and introduction of procedures for data collection, processing, analyzing and interpretation. This is a typical case of transfer of knowledge from developed regions to a developing country. However, knowledge was not transferred uncritically but screened for applicability under the specific local conditions. The use of digital recorders was rejected. For the Colombian network, long-range strip-chart recorders were selected as the most suitable type. The relationship between the hydrological regime and the physical characteristics of the basins was useful. Because Colombian land use is changing rapidly from forest to cattle raising and agriculture, the hydrological regime of most rivers is changing towards more extreme flood peaks and low waters. Therefore, theoretical frequency is not applicable indiscriminately, and graphical empirical methods offer definite advantages. (See also W74-00189) (Knapp-USGS)
W74-00227

TRANSFER OF WATER RESOURCES KNOWLEDGE ASPECTS OF THE WORK OF THE UNITED NATIONS SYSTEM,
United Nations Educational, Scientific and Cultural Organization, Paris (France). Office of Hydrology.
F. H. Verhoog.
In: Transfer of Water Resources Knowledge; Proceedings of 1st International Conference on Transfer of Water Resources Knowledge, September 1972, Fort Collins, Colorado: Water Resources Publications, Fort Collins, p 505-514, 1973. 4 ref.

Descriptors: *Information exchange, *Planning, *Water resources development, Water management (Applied), Irrigation, Economics, Social aspects, Political aspects, Data collections, Hydrologic data.
Identifiers: *Technology transfer, *Developing countries, *United Nations.

The work of the United Nations system in the transfer of water resources knowledge is described with emphasis on Unesco's role. The Agencies of the United Nations System put considerable effort into the transfer of knowledge from the developed to the developing countries. The volume, expressed in dollars, spent by United Nations on water resources knowledge transfer is only a fraction of the total world volume; therefore, United Nations effort is especially directed towards incentive action and assistance in planning. A country can promote the inflow of knowledge by one or a combination of the following: purchase of complete solutions, procedures, equipment, and manpower without any national scientific effort; recruitment of foreign specialists to teach and train nationals; sending nationals abroad to obtain the required knowledge; and procurement of published information from one or more developed countries. In addition to the training component inherent in every project, there is the idea that national and foreign experts work closely together. This seems to be the best way to transfer technology because all factors needed for success are available. After training abroad the national engineers are, if necessary, given an interesting job in their own country together with a foreign expert from whom they can learn everything necessary. Effects of a Nonrigid, Impermeable Bottom of Plane Surface Waves in Shallow Water,
W74-00030 2L

Dynamics of Swash and Implication to Beach Response,
W74-00032 2J

Characteristics of Wave Records in the Coastal Zone,
W74-00033 2H

Coastal Processes and Long Range Planning,
W74-00034 2L

Climb of a Bore on a Beach. Part I. Uniform Beach Slope,
W74-00035 2L

Environmental Studies of Monterey Bay and the Central California Coastal Zone,
W74-00036 2L

Seasonal Variations of Coastal Currents Off the Oregon - Northern California Coast,
W74-00037 2L

Long Term Changes in Marine Ecosystem: Ecological Relationships Between Tomales Bay and Adjacent Shelf Waters,
W74-00038 2L

COASTAL TOPOGRAPHY
Wave Induced Circulation and Longshore Current Patterns in the Coastal Zone,
W74-00023 2L

COASTAL ZONE
Land Use as a Factor in Coastal Water Quality,
W74-00383 2L

COASTS
Coastal Currents of the Western Gulf of Maine,
W74-00015 2H

Probabilities of Wave Characteristics in the Surf Zone,
W74-00018 2H

Tidal Currents and Zig-Zag Sand Shoals in a Wide Estuary Entrance,
W74-00021 2L

Wave Induced Circulation and Longshore Current Patterns in the Coastal Zone,
W74-00023 2L

Reorientation of Convex Shores,
W74-00028 2J

Characteristics of Wave Records in the Coastal Zone,
W74-00033 2H

Environmental Studies of Monterey Bay and the Central California Coastal Zone,
W74-00036 2L

Seasonal Variations of Coastal Currents Off the Oregon - Northern California Coast,
W74-00037 2L

Long Term Changes in Marine Ecosystem: Ecological Relationships Between Tomales Bay and Adjacent Shelf Waters,
W74-00038 2L

Land Use as a Factor in Coastal Water Quality,
W74-00383 2L

Semidiurnal Internal Tides in Massachusetts Bay,
W74-00504 2L

Mechanism of Sand Movement on Coastal Dunes,
W74-00509 2J

Initial Wave Scattering by an Inhomogeneous Medium and its Application to Shallow Water Waves,
W74-00513 2L

Wave Shoaling,
W74-00514 2E

A Method for Determining the Behavior of Long Waves Climbing a Sloping Beach,
W74-00515 2G

On the Origin of Certain Breakers off the Island of Aruba,
W74-00516 2E

Formation of Thermal Microstructure in a Narrow Embayment During Flushing,
W74-00517 2L

Wave Refraction Patterns in Hawke Bay,
W74-00518 2L

Studies on the Currents in the Littoral Zone of the Waltair Beach,
W74-00519 2J

Processes Affecting Seawater Characteristics Along the Oregon Coast,
W74-00520 2E

Coastal Processes Around the Otago Peninsula,
W74-00521 2J

Effects of the Alaska Earthquake and Tsunami on Recent Deltaic Sediments,
W74-00524 2J

Tidal Variation of the Size Distribution of Suspended Sediment at a Station in the Chesapeake Bay Turbidity,
W74-00525 2L

Water Waves at the Shoreline,
W74-00526 2E

COCKSFOOT
Yield and Chemical Composition of Cocksfoot in Dependence of Nitrogen Fertilization and Water Supply, (In Research),
W74-00491 3F

COLIFORMS
A Simple Technique for the Differentiation of Escherichia Coli In Water Examination,
W74-00296 5A

COLOMBIA
Recent Development of Hydrological Services in Colombia,
W74-00227 10A

COLOR REACTIONS
Bis-Aroylhydrazones of Alpha-Diketones as Reagents for Colorimetric and Fluorimetric Determinations of Calcium, Cadmium and other Cations,
W74-00286 2K

COLORADO
Effects of Artificial Destratification on Zooplankton in Parvin Lake, Colorado,
W74-00243 5C

Hydraulic Testing Accompanying Drilling of Five Exploratory Holes, Piceance Creek Basin, Colorado,
W74-00299 2F

Water in the San Luis Valley, South-Central Colorado,
W74-00331 2A

Water-Level Records, 1969-73, and Hydrogeologic Data for Baca and Southern Prowers Counties, Colorado,
W74-00332 2F

Cesium 137 in a Mountain Stream Channel,
W74-00376 5B

Individual Home Aerobic Wastewater Treatment Systems,
W74-00434 5D

COLORADO HIGH PLAINS
Digital Model of the Hydrologic System, Northern High Plains of Colorado--A Preliminary Report,
W74-00330 2F

COLORIMETRY
Bis-Aroylhydrazones of Alpha-Diketones as Reagents for Colorimetric and Fluorimetric Determinations of Calcium, Cadmium and other Cations,
W74-00286 2K

Determination of Orthophosphate,
W74-00464 5A

COLUMBIA RIVER
Processes Affecting Seawater Characteristics Along the Oregon Coast,
W74-00520 2E

COMPACTION
Effect of Compaction on Chemistry of Solutions Expelled from Montomorillonite Clay Saturated in Sea Water,
W74-00102 2J

Equation for One-Dimensional Vertical Flow of Groundwater: 2. Validity Range of the Diffusion Equation,
W74-00327 2F

COMPREHENSIVE PLANNING
Need for Metropolitan Water Balance Inventories,
W74-00187 6A

Metropolitan Development Guide, Water Resources Policy Plan, Program.
W74-00451 6B

Comprehensive Plan for Baton Rouge.
W74-00453 3D

COMPUTER MODELS
Role of Digital Computer Models of Aquifers in Water Resources Planning: Case Study in Tucson, Arizona,
W74-00176 4B

COMPUTER PROGRAMS
A Computer Program to Estimate the Combined Effect of Refraction and Diffraction of Water Waves,
W74-00024 2L

Optimal Allocation of Limited Water Resources,
W74-00179 6A

Enthalp, A Computer Program for the Calculation of Aquifer Chemistry in Hot-Water Geothermal Systems,
W74-00532 2F

CONCENTRATION POLARIZATION
Analytical and Experimental Studies of Reverse Osmosis Systems,
W74-00039 3A

CONDUCTIVITY
Water Chemistry of Ellicott Creek, Western New York,
W74-00166 5A

CONFERENCES
Ciesm and Marine Pollution,
W74-00543 5B

CONFINED WATER
The Dushanbe Artesian Basin and Its Mineral and Thermal Waters (Dushanbinskiy artezianskiy basseyn i yego mineral'nyye i termal'nyye vody),
W74-00117 4B

CONFINEMENT PENS
Waste-Induced Problems of Housed Livestock,
W74-00139 5G

CONGO RED
Microdetection of Nitrate with Malachite Green or Congo Red,
W74-00273 2K

CONGO SUBMARINE CANYON
Congo Submarine Canyon and Fan Valley,
W74-00093 2J

CONJUNCTIVE USE
Application of Hydrogeological Data to Long-Term Economics of Growing Sugar Cane in Venezuela,
W74-00196 10A

CONNATE WATER
Effect of Compaction on Chemistry of Solutions Expelled from Montomorillonite Clay Saturated in Sea Water,
W74-00102 2J

CONNECTICUT
The Politics of Water Pollution,
W74-00391 5G

CONNECTICUT RIVER
Differences in Littoral Fauna Due to Fluctuating Water Levels Below A Hydroelectric Dam,
W74-00463 2I

CONSOLIDATION
Equation for One-Dimensional Vertical Flow of Groundwater: 2. Validity Range of the Diffusion Equation,
W74-00327 2F

CONSTRAINTS
Applications of Linear Integer Programming to Problems of Land Use Allocation,
W74-00503 4A

CONSULTING ENGINEERS
Development and Pilot-Testing of an Automatic Information Dissemination System.
W74-00003 5D

CONTARINIA-TRITICI
Relations Between Host Plants and Phenology of the Gall Midges Contarinia Tritici (Kirby) and Sitodiplosis Mosellana (Geh.), (In German),
W74-00388 3F

CONTENT ANALYSIS
Development and Pilot-Testing of an Automatic Information Dissemination System.
W74-00003 5D

CONTINENTAL SHELF
Sea-Surface Circulation, Sediment Transport, and Marine Mammal Distribution, Alaska Continental Shelf,
W74-00298 2J

CONVERSION
Conversion of Urban Refuse to Oil,
W74-00406 5D

COOK INLET AREA (ALASKA)
Sea-Surface Circulation, Sediment Transport, and Marine Mammal Distribution, Alaska Continental Shelf,
W74-00298 2J

COOLING TOWERS
Pilot-Demonstration Project for Industrial Reuse of Renovated Municipal Wastewater,
W74-00305 5D

COORDINATION
Regional Administrator's Summary,
W74-00141 5G

Research Implementation, A Coordinated Approach,
W74-00191 10A

CORE DRILLING
In Situ Measurement of Sediment Sound Speed During Coring,
W74-00294 2J

Hydraulic Testing Accompanying Drilling of Five Exploratory Holes, Piceance Creek Basin, Colorado,
W74-00299 2F

CORE LOGGING
Hydraulic Testing Accompanying Drilling of Five Exploratory Holes, Piceance Creek Basin, Colorado,
W74-00299 2F

CORN
Nitrate Content of Percolates from Manured Lysimeters,
W74-00417 5B

The Transpiration of Corn,
W74-00467 2D

COST ANALYSIS
Studies in the Analysis of Metropolitan Water Resources Systems, Vol. VI Estimating Economies of Scale in Thermal Electric Power Systems Subjected to Environmental Quality Constraints,
W74-00002 6B

Energy Conservation Strategies,
W74-00152 6B

Cost-Effectiveness of Water Resources Systems Design in Developing Countries: Case of the Lower Mekong,
W74-00171 6B

Capital and Operating Costs of Pollution Control Equipment Modules, Volume I, USER GUIDE,
W74-00307 5G

Capital and Operating Costs of Pollution Control Equipment Modules, Volume II, DATA MANUAL,
W74-00308 5G

COST-EFFECTIVENESS
Cost-Effectiveness of Water Resources Systems Design in Developing Countries: Case of the Lower Mekong,
W74-00171 6B

Cost-Effectiveness Analysis of Disposal Systems,
W74-00184 5E

COST MINIMIZATION
Flood Control Model for Multi-Reservoir Systems,
W74-00168 4A

Optimal Allocation of Limited Water Resources,
W74-00179 6A

Reliability of Urban Water Quality Management,
W74-00180 5G

Design of Optimal Sewerage Systems,
W74-00183 5D

COSTS
Design of Optimal Sewerage Systems,
W74-00183 5D

Capital and Operating Costs of Pollution Control Equipment Modules, Volume I, USER GUIDE,
W74-00307 5G

Capital and Operating Costs of Pollution Control Equipment Modules, Volume II, DATA MANUAL,
W74-00308 5G

Costs for Large Scale Continuous Pyrolysis of Solid Wastes,
W74-00404 5D

COTINUS
Comparative Characteristics of Ecological Conditions in Annual Clearing and Under a Canopy in Dry Cotinus Oak Woods, (In Russian),
W74-00487 2I

COTTON
Intensity of Plant Transpiration in Certain Varieties and Mutant Forms of Cotton, (In Russian),
W74-00026 3F

COUMAPHOS
Coumaphos as a Feed Additive for the Control of House Fly Larvae in Cow Manure,
W74-00411 5D

COWDOMINIUM
New Feedlot Concept Uses Converted Manure as Feed,
W74-00415 5D

CREEP
Anticipated Closure Rates for a Proposed Drill Hole, Ross Ice Shelf, Antarctica,
W74-00335 2C

CROP YIELD
Crop Yields from Land Receiving Large Manure Applications,
W74-00425 3C

CROSS CAY (P.R.)
Effects of Underwater Demolition on the Environment in a Small Tropical Marine Cove,
W74-00233 5C

CRUDE OIL
The Environmental Fate of Stranded Crude Oil,
W74-00049 5B

Compositional Studies of a High-Boiling 370-535 C Distillate from Prudhoe Bay, Alaska, Crude Oil,
W74-00258 5A

CRUDE OIL SOURCES
A Multiparameter Oil Pollution Source Identification System,
W74-00432 5A

CULTIVATION
Crop Yields from Land Receiving Large Manure Applications,
W74-00425 3C

CURRENTS (WATER)
Seasonal Variations of Coastal Currents Off the Oregon - Northern California Coast,
W74-00037 2L

CUTIN
Identification of Cutin, a Lipid Biopolymer, as Significant Component of Sewage Sludge,
W74-00072 5A

CYANOPHYTA
Mutations Arising During Transformation in the Blue-Green Alga Anacystis nidulans,
W74-00234 5C

CO2 Fixation by the Blue-Green Alga Anacystis nidulans,
W74-00236 5C

Periodicity of the Blue-Green Algae and Their Effect on the Efficiency of Manure-Disposal Lagoons,
W74-00430 5D

Observations on the Nitrogen Fixing Potential of the Surface Waters of a Large Impoundment,
W74-00436 5C

Role of Bacteria in the Feeding of Zooplankton of the Dnieper Reservoirs, (In Russian),
W74-00496 5C

CYANOPHYTO
Nitrogen Sources and Cycling in Natural Waters,
W74-00149 5C

CYCLONE PRECIPITATION
Tropical Cyclone Precipitation in New Jersey,
W74-00435 2B

CYTOLOGICAL STUDIES
The Amino Acid and Sugar Composition of Diatom Cell-Walls,
W74-00240 5C

Orientation of Chlorophyll in Vivo. Studies with Magnetic Field Oriented Chlorella,
W74-00245 5C

Holographic Microscopy of Diatoms,
W74-00247 5C

CZECHOSLOVAKIA
Processing of Results of Observations of Spring Discharge,
W74-00096 2E

DADE COUNTY (FLA.)
Salinity Studies in East Glades Agricultural Area, Southeastern Dada County, Florida,
W74-00329 3C

DAGENESIS
Carbonate Cementation of Some Pleistocene Temperate Marine Sediments,
W74-00106 2J

DAIRY INDUSTRY
Enrichment of the Atmosphere with Nitrogen Compounds Volatilized From a Large Dairy Area,
W74-00409 5B

DAM DEMOLITION
Demolition of Ft. Meade Dam, Sturgis, South Dakota, June 1972,
W74-00322 8H

DAM DESIGN
Muddy Creek Dam and Reservoir, Emery County, Feasibility Study.
W74-00546 8A

DAMS
Demolition of Ft. Meade Dam, Sturgis, South Dakota, June 1972,
W74-00322 8H

DATA COLLECTIONS
Expected Optimum Record Length as a Basis for Hydrologic Network Design,
W74-00178 7C

An On-Line Spectrophotometer for Collection of Manipulation of Absorbance Spectra,
W74-00272 7C

Capital and Operating Costs of Pollution Control Equipment Modules, Volume II, DATA MANUAL,
W74-00308 5G

DATA EVALUATION
Expected Optimum Record Length as a Basis for Hydrologic Network Design,
W74-00178 7C

DATA PROCESSING
Water Resources Scientific and Technical Information Display, Storage, and Retrieval,
W74-00192 10A

The Information Science Approach to Transfer of Knowledge,
W74-00193 10A

Transmitting Water Resources Information By a Time-Share System,
W74-00194 10A

The Water Resources Information Program at the University of Wisconsin,
W74-00204 10A

Organic Pollutant Identification Utilizing Mass Spectrometry,
W74-00309 5A

DATA TRANSMISSION
An On-Line Spectrophotometer for Collection of Manipulation of Absorbance Spectra,
W74-00272 7C

DATE PROCESSING
An On-Line Spectrophotometer for Collection of Manipulation of Absorbance Spectra,
W74-00272 7C

DECISION MAKING
The Politics of Water Pollution,
W74-00391 5G

DEEP TILLAGE
Observations on the Soil-Water Regimes in a Drained Clay Soil,
W74-00359 2G

DEGRADATION (DECOMPOSITION)
Effects of pH, Light and Temperature on Carbaryl in Aqueous Media,
W74-00056 5B

DEGRADATION PRODUCTS
Photolysis of the Herbicide Dinitramine (N3,N3-Diethyl-2,4-Dinitro-6-Trifluoromethyl-M-Phenylenediamine),
W74-00282 5B

DEGRADATION RATES
Photolysis of the Herbicide Dinitramine (N3,N3-Diethyl-2,4-Dinitro-6-Trifluoromethyl-M-Phenylenediamine),
W74-00282 5B

DEGRADATION (STREAM)
Watershed Program Lacks Ecological Dimensions,
W74-00442 6G

DELAWARE BAY AREA
Application of Ecological, Geological and Oceanographic ERTS-1 Imagery to Delaware's Coastal Resources Planning,
W74-00540 7B

DELAWARE RIVER
Application of Ecological, Geological and Oceanographic ERTS-1 Imagery to Delaware's Coastal Resources Planning,
W74-00540 7B

DELTAS
The Evolution of a Discrete Beaver Habitat in the Mackenzie River Delta, Northwest Territories,
W74-00481 2I

Effects of the Alaska Earthquake and Tsunami on Recent Deltaic Sediments,
W74-00524 2J

DENITRIFICATION
Nitrate and Nitrite Volatilization by Microorganisms in Laboratory Experiments,
W74-00008 5G

Soil Denitrification in Sealed Soil-Plant Systems: II. Effect of Soil Water Content and Form of Applied Nitrogen,
W74-00014 2G

Soil Dentrification in Sealed Soil-Plant Systems: III. Effect of Disturbed and Undisturbed Soil Samples,
W74-00025 2G

Soil Denitrification in Sealed Soil-Plant Systems: I. Effect of Plants, Soil Water Content and Soil Organic Matter Content,
W74-00237 2G

DENMARK (LAKE ESROM)
Ecology and Production of the Profundal Benthos in Relation to Phytoplankton in Lake Esrom,
W74-00466 5C

DENTRIFICATION
Drain Installation for Nitrate Reduction,
W74-00398 5G

DEPOSITION (SEDIMENTS)
Double-Humped Waves on a Sloping Beach,
W74-00016 2J

Tidal Currents and Zig-Zag Sand Shoals in a Wide Estuary Entrance,
W74-00021 2L

Dynamics of Swash and Implication to Beach Response,
W74-00032 2J

Studies on the Currents in the Littoral Zone of the Waltair Beach,
W74-00519 2J

Tidal Variation of the Size Distribution of Suspended Sediment at a Station in the Chesapeake Bay Turbidity,
W74-00525 2L

DESALINATION
Analytical and Experimental Studies of Reverse Osmosis Systems,
W74-00039 3A

Evaluation of the Reliability and Maintainability of Desalting Plants.
W74-00040 3A

Desalination Process,
W74-00081 3A

Membrane Processes (Osmosis and Reverse Osmosis),
W74-00145 3A

DESALINATION

Ion-Selective Electrochemical Sensors,
W74-00146 3A

Methods for Controlling Marine Fouling in Intake Systems,
W74-00148 3A

Municipal Desalting Studies for Selected Kansas Communities,
W74-00156 5F

Improved Ethyl Cellulose Membranes for Reverse Osmosis Application,
W74-00157 3A

New Membrane Compositions for Desalination of Water by Reverse Osmosis,
W74-00158 3A

Development of Improved Membranes for Reverse Osmosis,
W74-00159 3A

Evaluation of Asymmetric Hollow Fibers for Desalination by Reverse Osmosis,
W74-00160 3A

Hydrocasting Reverse Osmosis Membranes, Development of Porous Support Tubes, Study of Mechanism of Membrane Formation and Development of Non-Cellulosic Desalination Membranes,
W74-00161 3A

Reactions and Transport Phenomena, at Surfaces,
W74-00162 3A

Transport Properties of Charge-Mosaic Membranes-Part A,
W74-00310 3A

New Polymer Membrane Technology for Desalination of Seawater by Reverse Osmosis,
W74-00312 3A

Research on Composite Hollow Tubules,
W74-00315 3A

Research on Advanced Membranes for Reverse Osmosis,
W74-00318 3A

Design Integrity and Performance Characteristics of Helical Tubular Module Elements in Reverse Osmosis Plants,
W74-00319 3A

Hygienic Evaluation of the Quality of Water Obtained by Means of Electrodialysis Desalting of Imitation Sea Water, (In Russian),
W74-00478 3A

DESALINATION APPARATUS

Research on Composite Hollow Tubulets,
W74-00317 3A

DESALINATION PROCESSES

Transport Properties of Charge-Mosaic Membranes - Part B,
W74-00311 3A

DESALINATIONPROCESSES

Development of High-Flux Hollow Reverse Osmosis Fibers for Brackish Water Softening,
W74-00314 3A

DESIGN

Cost-Effectiveness of Water Resources Systems Design in Developing Countries: Case of the Lower Mekong,
W74-00171 6B

Expected Optimum Record Length as a Basis for Hydrologic Network Design,
W74-00178 7C

Design of Optimal Sewerage Systems,
W74-00183 5D

DESMIDIACEAE

Desmidiaceae of Waste Waters, (In Russian),
W74-00485 5D

DESTRATIFICATION

Effects of Artificial Destratification on Zooplankton in Parvin Lake, Colorado,
W74-00243 5C

DETENTION RESERVOIRS

Methodology for Assessing the Potential Impact of Urban Development on Urban Runoff and the Relative Efficiency of Runoff Control Alternatives,
W74-00001 2A

DETERGENTS

Biodegradability of Nonionic Surfactants: Screening Test for Predicting Rate and Ultimate Biodegradation,
W74-00269 5B

DEVELOPING COUNTRIES

Transfer of Water Resources Knowledge.
W74-00189 10A

Economic Analysis and Municipal Water Supply in Developing Countries,
W74-00190 10A

Water Resources Development Policies and Transfer of Knowledge from Developed to Developing Countries,
W74-00206 10A

Water Resources Utilization in Developing Countries,
W74-00207 10A

Obstacles to Consideration of Resources Management Alternatives: South Asian Experience,
W74-00208 10A

Transfer of Water Resources Knowledge from Developed to Developing Regions of the World,
W74-00209 10A

Knowledge Transfer,
W74-00210 10A

A Case on Transfer of Knowledge in Water Resources Systems Planning from a Developed Region to a Developing One, and from Research to Application,
W74-00211 10A

Research and Education for Development,
W74-00212 10A

Venezuelan Experience on the Transfer of Knowledge in Water Resources Engineering,
W74-00213 10A

Achievements of India in the Field of Water Resources Development,
W74-00214 10A

Experience of the U.S. Geological Survey in Transfer of Hydrologic Knowledge to the Developing Countries,
W74-00215 10A

Some Problems Associated with the Use of Foreign Advisors in Developing Countries,
W74-00216 10A

Transfer of Knowledge in Water Resources from Developed to Developing Regions with Special Reference to the Conditions of West Pakistan,
W74-00217 10A

Methods of Transfer of Water Resources Knowledge from Developed to Developing Regions with Special Emphasis to On-Farm Water Management,
W74-00219 10A

Guidelines for Transfer of Practice to Applications for Optimum on Planning of Key Items of Water Resource Projects,
W74-00220 10A

New Frontiers in Drainage and Reclamation Engineering in the Indus Plains,
W74-00221 10A

The Role of FAO in the Transfer of Water Resources Knowledge to Developing Regions,
W74-00223 10A

Technical Activities by FAO in the Transfer of Water Resources Knowledge to Developing Regions,
W74-00224 10A

Transfer of Knowledge in Water Resources Policies from Developed to Developing Countries,
W74-00225 10A

Recent Development of Hydrological Services in Colombia,
W74-00227 10A

Transfer of Water Resources Knowledge Aspects of the Work of the United Nations System,
W74-00228 10A

DIAGENESIS

Holocene Meteoric Dolomitization of Pleistocene Limestones, North Jamaica,
W74-00101 2J

DIATOMS

The Amino Acid and Sugar Composition of Diatom Cell-Walls,
W74-00240 5C

Holographic Microscopy of Diatoms,
W74-00247 5C

DIAZINON

The Rapid Determination of The Organophosphorus Pesticides Diazinon and Dichlorvos in Blood by Gas Chromatography,
W74-00460 5A

DIETS

Excretion Studies in Swine Fed Arsanilic Acid,
W74-00400 5B

The Effect of Feeding Laying Hens Various Levels of Cow Manure on the Pigmentation of Egg Yolks,
W74-00407 5C

DIFFFRACTION (WATER WAVES)

A Computer Program to Estimate the Combined Effect of Refraction and Diffraction of Water Waves,
W74-00024 2L

DIFFUSION
Analytical Solutions to the One-Dimensional Nonlinear Diffusion Equation for Flow Through Porous Media,
W74-00365 2F

DIGESTION
The Effect of Ration on Engineering Properties of Beef Cattle Manure,
W74-00420 5B

DIKES
Lake Okeechobee Seepage Monitoring Network,
W74-00337 4A

DINITRAMINE
Photolysis of the Herbicide Dinitramine (N3,N3-Diethyl-2,4-Dinitro-6-Trifluoromethyl-M-Phenylenediamine),
W74-00282 5B

DISCHARGE (WATER)
Processing of Results of Observations of Spring Discharge,
W74-00096 2E

Time Series Analysis of the Hydrologic Regimen of a Groundwater Discharge Area,
W74-00362 2F

DISCHLORVOS
The Rapid Determination of The Organophosphorus Pesticides Diazinon and Dichlorvos in Blood by Gas Chromatography,
W74-00460 5A

DISPERSION
Some Aspects of the Hydrodynamic Dispersion of Solutes in Porous Materials,
W74-00360 2G

Dispersion-Affected Transport of Reacting Solutes in Saturated Porous Media: Galerkin Method Applied to Equilibrium-Controlled Exchange in Unidirectional Steady Water Flow,
W74-00364 5B

Experimental and Mathematical Modeling of Liquid-Liquid Miscible Displacement in Porous Media,
W74-00366 2F

Dispersion During Flow in Porous Media with Bilinear Adsorption,
W74-00367 5B

An Evaluation of Mixing in the Tay Estuary,
W74-00384 2L

DISPERSIVE WAVE TRAINS
Theoretical and Experimental Study of Wave Enhancement and Runup on Uniformly Sloping Impermeable Beaches,
W74-00022 2H

DISSEMINATION TECHNIQUES
Development and Pilot-Testing of an Automatic Information Dissemination System.
W74-00003 5D

DISSOLVED OXYGEN
Seasonal Variations in Selected Physicochemical Conditions of a Small Lake in Brazos County, Texas,
W74-00074 2H

Water Chemistry of Ellicott Creek, Western New York,
W74-00166 5A

DISTANCE
River Mile Index-San Joaquin River, Tulare Lake and Buena Vista Lake Basins, California.
W74-00549 2E

River Mile Index-Klamath River, Pacific Slope Basin, California-Oregon.
W74-00550 2E

DISTILLATION
Compositional Studies of a High-Boiling 370-535 C Distillate from Prudhoe Bay, Alaska, Crude Oil,
W74-00258 5A

DISTRIBUTION
Inorganic and Organic Phosphorus Distribution in Domestic and Municipal Sewage,
W74-00055 5B

DOCUMENTATION
Mercury: Environmental Considerations, Part I,
W74-00292 5C

DOLOMITE
Holocene Meteoric Dolomitization of Pleistocene Limestones, North Jamaica,
W74-00101 2J

DOMESTIC WASTES
Inorganic and Organic Phosphorus Distribution in Domestic and Municipal Sewage,
W74-00055 5B

DONIPHAN COUNTY (KANS)
Geohydrology of Doniphan County, Northeastern Kansas,
W74-00536 7C

DOSING APPARATUS
A Simple Principle for Dosing Apparatus in Aquatic Systems,
W74-00473 7B

DRAINAGE
The Role of the International Commission on Irrigation and Drainage in the Transfer of Water Resources Knowledge,
W74-00199 10A

Observations on the Soil-Water Regimes in a Drained Clay Soil,
W74-00359 2G

DRAINAGE AREA
Drainage Areas of Texas Streams, Lavaca River Basin.
W74-00548 2E

DRAINAGE PATTERNS (GEOLOGIC)
A Stream Length Study,
W74-00380 2E

DRAINAGE SYSTEMS
Preliminary Report of Public Utilities Analysis.
W74-00458 3D

DRAINAGE WATER
Organochlorine Insecticide Residues in Streams Draining Agricultural, Urban-Agricultural, and Resort Areas of Ontario, Canada - 1971,
W74-00070 5B

DRAINS
Drain Installation for Nitrate Reduction,
W74-00398 5G

FLUORESCENCE SPECTROSCOPY
Detection of Trace Amounts of Oil in Sea Water by Fluorescence Spectroscopy,
W74-00059 5A

FLUORESCENCE TRANSIENTS
The Effects of Carbon Dioxide Concentration on Oxygen Evolution and Fluorescence Transients in Synchronous Cultures of Chlorella pyrenoidosa,
W74-00239 5C

FLUOROMETRY
A Fluorometric Method for the Determination of Nitrilotriacetic Acid,
W74-00274 5A

Bis-Aroylhydrazones of Alpha-Diketones as Reagents for Colorimetric and Fluorimetric Determinations of Calcium, Cadmium and other Cations,
W74-00286 2K

FLY CONTROL
Effect of Bacillus Thuringiensis in Cattle Manure on House Fly Larvae,
W74-00414 5G

FOOD AND AGRICULTURAL ORGANIZATION (UN)
The Role of FAO in the Transfer of Water Resources Knowledge to Developing Regions,
W74-00223 10A

Technical Activities by FAO in the Transfer of Water Resources Knowledge to Developing Regions,
W74-00224 10A

FORECASTING
Rate of Evaporation of Low-Solubility Contaminants from Water Bodies to Atmosphere,
W74-00071 5B

Agricultural Water Allocation, Land Use, and Policy,
W74-00186 3F

FOREIGN COUNTRIES
Ciesm and Marine Pollution,
W74-00543 5B

FOREIGN PROJECTS
Technical Aid for Hydrologic Studies in Spanish-Speaking Countries,
W74-00202 10A

Water Resources Development Policies and Transfer of Knowledge from Developed to Developing Countries,
W74-00206 10A

FOREST WATERSHEDS
Spring Runoff From Small Catchments with Different Forest Cover in the Mountains of Georgia,
W74-00339 4A

FOULING
Methods for Controlling Marine Fouling in Intake Systems,
W74-00148 3A

FRACTIONATION
Preparative Free-Flow Electrophoresis as a Method of Fractionation of Natural Organic Materials,
W74-00321 2K

FRAZER LAKE (ALASKA)
Frazer Lake Sockeye Investigations, 1970,
W74-00232 8I

FREQUENCY
Determination of the Duration of Natural Hydrologic Periods,
W74-00113 2C

Experimental Hydrodynamic Calculation of Aperiodic Water-Level Fluctuations in Estuaries,
W74-00114 2L

FRESNO COUNTY (CALIF)
Central Fresno County Water and Liquid Waste Program: Volume I-Findings, Conclusions, Recommendations.
W74-00457 3D

FROZEN SOILS
Analysis of Coupled Heat-Fluid Transport in Partially Frozen Soil,
W74-00369 2G

FT. MEADE DAM (S DAK)
Demolition of Ft. Meade Dam, Sturgis, South Dakota, June 1972,
W74-00322 8H

FUEL OIL
Association of Hydrocarbons and Mineral Particles in Saline Solution,
W74-00265 5B

FUELS
Conversion of Urban Refuse to Oil,
W74-00406 5D

GAGING STATIONS
Stream Gauging Information, Australia--Supplement 1971.
W74-00350 7C

GALERKIN METHOD
Galerkin Solution of the Inverse Problem for Aquifer Transmissivity,
W74-00363 2F

Dispersion-Affected Transport of Reacting Solutes in Saturated Porous Media: Galerkin Method Applied to Equilibrium-Controlled Exchange in Unidirectional Steady Water Flow,
W74-00364 5B

GAMMA RAYS
Use of the Gamma Field of the Earth to Determine the Water Content of Soils,
W74-00108 2G

GAS CHROMATOGRAPHY
Gas-Chromatographic Determination of Selenium,
W74-00041 2K

A Simplified Clean-Up Technique for Organochlorine Residues at the Microliter Level,
W74-00058 5A

Gas Chromatographic Procedure to Analyze Amino Acids in Lake Waters,
W74-00061 5A

Baseline Concentrations of Light Hydrocarbons in Gulf of Mexico,
W74-00073 5B

Gas Chromatographic Determination of Aliphatic Amines and Quantitative Analysis of Small Amounts of Dimethylamine in Wastewater,
W74-00077 5A

Methylmercury as Percentage of Total Mercury in Flesh and Viscera of Salmon and Sea Trout of Various Ages,
W74-00079 5C

The Determination of Chromium in Human Urine by Gas Chromatography Using a Flame Photometric Detector with a 425, 4 NM Filter,
W74-00270 5A

Coupling of High Speed Plasma Chromatography with Gas Chromatography,
W74-00271 2K

Analysis of Explosives in Sea Water and in Ocean Floor Sediment and Fauna,
W74-00285 5A

Organic Pollutant Identification Utilizing Mass Spectrometry,
W74-00309 5A

The Rapid Determination of The Organophosphorus Pesticides Diazinon and Dichlorvos in Blood by Gas Chromatography,
W74-00460 5A

GAS LIQUID CHROMATOGRAPHY

Gas-Liquid Chromatography-Mass Spectrometry of Organomercury Compounds,
W74-00253 5A

GC-MASS SPECTROMETRY

Polychlorinated Terphenyls in the Environment,
W74-00057 5A

Petrochemical Analytical Problems. II. Gas-Liquid Chromatographic-Mass Spectrometric Investigation of Industrial Dodecylbenzenes,
W74-00250 5A

Gas-Liquid Chromatography-Mass Spectrometry of Organomercury Compounds,
W74-00253 5A

GC-PLASMA CHROMATOGRAPHY

Coupling of High Speed Plasma Chromatography with Gas Chromatography,
W74-00271 2K

GELS

Development of Improved Membranes for Reverse Osmosis,
W74-00159 3A

GENERATORS

Electrical Power Plant Driven by Ocean Waves and Tides,
W74-00092 8C

GENETICS

Mutations Arising During Transformation in the Blue-Green Alga Anacystis nidulans,
W74-00234 5C

GEOCHEMISTRY

Silica-Carbonate Alteration of Serpentine: Wall Rock Alteration in Mercury Deposits of the California Coast Ranges,
W74-00304 2K

Enthalp, A Computer Program for the Calculation of Aquifer Chemistry in Hot-Water Geothermal Systems,
W74-00532 2F

GEOLOGY

Geology and Ground-water Resources of Rush County, Central Kansas,
W74-00352 4B

GEOMORPHOLOGY

A Stream Length Study,
W74-00380 2E

GEORGIA

Georgia's Water Problems and Related Research Needs,
W74-00004 6B

GEORGIAN SSR

Spring Runoff From Small Catchments with Different Forest Cover in the Mountains of Georgia,
W74-00339 4A

GEOTHERMAL STUDIES

Enthalp, A Computer Program for the Calculation of Aquifer Chemistry in Hot-Water Geothermal Systems,
W74-00532 2F

GERMAN (METTMA STREAM)

Hydrography, Chemistry and Load of Nutrients of a Mountain Stream Polluted by Organic Waste Water, (In German),
W74-00499 5C

GERMANY

Noxious Substances Contained in the Waters: Their Origin, Bearing, and Their Elimination, (In German),
W74-00065 5B

Relations Between Host Plants and Phenology of the Gall Midges Contarinia Tritici (Kirby) and Sitodiplosis Mosellana (Geh.), (In German),
W74-00388 3F

GERMANY (METTMA STREAM)

Research on the Mettma Brook at Falkau, (In German),
W74-00497 5B

The Mettma: A Mountain Stream as a Brewery's Draining Ditch: Microbiological Investigations Along the Gradient of Pollution, (In German),
W74-00498 5B

GESTATION

Observations on the Effect of Protein Intake and Stage of Gestation on the Proportion of Urinary Nitrogen Excreted as Urea in Sheep,
W74-00408 5B

GLACIAL DRIFT

Quaternary Glaciation in Transbaykalia (Chetvertichnoye oledeneniye Zabaykal'ya),
W74-00343 2C

GLACIAL SEDIMENTS

Quaternary Glaciation in Transbaykalia (Chetvertichnoye oledeneniye Zabaykal'ya),
W74-00343 2C

GLACIAL SURGES

Evidence of a Surge on Barnes Ice Cap, Baffin Island,
W74-00537 2C

GLACIATION

Quaternary Glaciation in Transbaykalia (Chetvertichnoye oledeneniye Zabaykal'ya),
W74-00343 2C

Evidence of a Surge on Barnes Ice Cap, Baffin Island,
W74-00537 2C

GLACIERS

Determination of Liquid Runoff from the Firn Field of a Glacier,
W74-00115 2C

Quaternary Glaciation in Transbaykalia (Chetvertichnoye oledeneniye Zabaykal'ya),
W74-00343 2C

Investigation of Ice Movement on Mountain Glaciers by Stereophotogrammetry (Issledovaniye dvizheniya l'da gornykh lednikov stereofotogrammetricheskim metodom),
W74-00346 2C

Evidence of a Surge on Barnes Ice Cap, Baffin Island,
W74-00537 2C

GLACIOLOGY

Soluble Particulates in Ice From Site 2, Greenland,
W74-00334 2C

Anticipated Closure Rates for a Proposed Drill Hole, Ross Ice Shelf, Antarctica,
W74-00335 2C

GLUE FACTORY WASTES

Glue Treatment-Pick a Way,
W74-00165 5D

GOLDFISH

Toxicity of Polychlorinated Biphenyls (PCB) to Goldfish,
W74-00492 5C

GRASSLANDS

Water-Salt Balance of Groundwater in the Golodnaya Steppe in 1969 (Vodno-solevoy balans podzemnykh vod Golodnoy stepi za 1969 god),
W74-00340 4B

GRAVITY WAVES

Semidiurnal Internal Tides in Massachusetts Bay,
W74-00504 2L

GREAT BRITAIN (OXFORD)

Studies on the Biology and Control of Vaucheria dichotoma Found in Freshwaters in Britain,
W74-00541 2I

GREAT LAKES

Eutrophication Research Applied to Water Quality Management on the Great Lakes,
W74-00205 10A

Man's Effect on the Great Lakes,
W74-00444 4C

GREENLAND

Soluble Particulates in Ice From Site 2, Greenland,
W74-00334 2C

GROUNDNUT

Effect of Irrigation and Fertilizer Levels on the Yield and Quality of Groundnut,
W74-00469 3F

GROUNDWATER

Dynamics of Swash and Implication to Beach Response,
W74-00032 2J

Ground-Water Nitrate Pollution in Rural Areas,
W74-00095 5B

Holocene Meteoric Dolomitization of Pleistocene Limestones, North Jamaica,
W74-00101 2J

GROUNDWATER

Role of Digital Computer Models of Aquifers in Water Resources Planning: Case Study in Tucson, Arizona,
W74-00176 4B

Salinity Studies in East Glades Agricultural Area, Southeastern Dada County, Florida,
W74-00329 3C

Water-Salt Balance of Groundwater in the Golodnaya Steppe in 1969 (Vodno-solevoy balans podzemnykh vod Golodnoy stepi za 1969 god),
W74-00340 4B

Hydrogeological Basis for Protection of Groundwater and Water Wells from Pollutants (Gidrogeologicheskoye obosnovaniye zashchity podzemnykh vod i vodozaborov ot zagryazneniy),
W74-00347 5B

Steady State Ground Motions Caused by Single-Well Pumping,
W74-00361 4B

Time Series Analysis of the Hydrologic Regimen of a Groundwater Discharge Area,
W74-00362 2F

Central Fresno County Water and Liquid Waste Program: Volume I-Findings, Conclusions, Recommendations.
W74-00457 3D

GROUNDWATER BASINS

The Dushanbe Artesian Basin and Its Mineral and Thermal Waters (Dushanbinskiy artezianskiy basseyn i yego mineral'nyye i termal'nyye vody),
W74-00117 4B

GROUNDWATER MOVEMENT

Equation for One-Dimensional Vertical Flow of Groundwater: 2. Validity Range of the Diffusion Equation,
W74-00327 2F

Some Aspects of the Hydrodynamic Dispersion of Solutes in Porous Materials,
W74-00360 2G

Galerkin Solution of the Inverse Problem for Aquifer Transmissivity,
W74-00363 2F

Dispersion-Affected Transport of Reacting Solutes in Saturated Porous Media: Galerkin Method Applied to Equilibrium-Controlled Exchange in Unidirectional Steady Water Flow,
W74-00364 5B

Analytical Solutions to the One-Dimensional Nonlinear Diffusion Equation for Flow Through Porous Media,
W74-00365 2F

Experimental and Mathematical Modeling of Liquid-Liquid Miscible Displacement in Porous Media,
W74-00366 2F

Dispersion During Flow in Porous Media with Bilinear Adsorption,
W74-00367 5B

Method for Numerical Simulation of Flow in Multiaquifer Systems,
W74-00382 2F

Underground Movement of Wastes Clarified.
W74-00538 5B

GROUNDWATER RECHARGE

Modification of Water Quality During Artificial Groundwater Recharge,
W74-00116 4B

Artificial-Recharge Experiments and Operations on the Southern High Plains of Texas and New Mexico,
W74-00325 4B

Ground Water Recharge, Southern Regional District, Montgomery County, Ohio, Engineering Study and Report, Phase I.
W74-00439 4B

GROUNDWATER RESOURCES

Digital Simulation and Projection of Water-Level Declines in Basalt Aquifers of the Odessa-Lind Area, East-Central Washington,
W74-00326 2F

Digital Model of the Hydrologic System, Northern High Plains of Colorado--A Preliminary Report,
W74-00330 2F

Water in the San Luis Valley, South-Central Colorado,
W74-00331 2A

Water-Level Records, 1969-73, and Hydrogeologic Data for Baca and Southern Prowers Counties, Colorado,
W74-00332 2F

Availability of Water from Limestone and Dolomite Aquifers in Southwest Ohio and the Relation of Water Quality to the Regional Flow System,
W74-00336 4B

Geology and Ground-water Resources of Rush County, Central Kansas,
W74-00352 4B

Ground-water Conditions in Utah, Spring of 1973,
W74-00353 4B

Water Resources Summary, Island of Hawaii,
W74-00355 2E

A Reconnaissance of the Water Resources in the Pahsimeroi River Basin, Idaho,
W74-00356 2E

Reconnaissance of the Water Resources of Beaver County, Oklahoma,
W74-00534 7C

Geohydrology of Doniphan County, Northeastern Kansas,
W74-00536 7C

Regional Specific Yield of the Edwards and Associated Limestones in the San Antonio, Texas Area,
W74-00542 2F

GROWTH RATES

Ecological Studies on the Penaeus orientalis Kishinoue Cultured in a Pond Filled with Sea Water: I. Growth Rate as Related to the Substrate Materials, Survival Rate, Predator of P. Orientalis, and Water Conditions of Culturing Pond,
W74-00486 5C

GULF COASTAL PLAIN

Tidal Characteristics of Two Estuaries in Florida,
W74-00508 5B

GULF OF MEXICO

Baseline Concentrations of Light Hydrocarbons in Gulf of Mexico,
W74-00073 5B

HALIDES

Salting-Out of Acetone from Water -Basis of a New Solvent Extraction System,
W74-00290 2K

HALOGENS

Taste Thresholds of Halogens in Water,
W74-00119 5F

HAWAII

Hydrology and Sediment Transport, Moanalua Valley, Oahu, Hawaii,
W74-00354 2E

Water Resources Summary, Island of Hawaii,
W74-00355 2E

Water Quality Program for Oahu with Special Emphasis on Waste Disposal: Final Report.
W74-00456 5D

HEAT BALANCE

Effect of Salinity on the Optical Extinction of Sea Ice at 6328A,
W74-00333 2C

HEAT EXCHANGERS

Pilot-Demonstration Project for Industrial Reuse of Renovated Municipal Wastewater,
W74-00305 5D

HEAT FLOW

Analysis of Coupled Heat-Fluid Transport in Partially Frozen Soil,
W74-00369 2G

HEAT STRESS

Sprinkling Cattle for Relief from Heat Stress,
W74-00421 3F

HEATING

Influence of Heating Rate on Analytical Response in Flameless Atomic Absorption Spectrometry,
W74-00278 5A

HEAVY METALS

Sampling the Edible Muscle of the Swordfish (Xiphias gladius) for Total Mercury Analysis,
W74-00052 5A

Toxic Materials Analysis of Street Surface Contaminants,
W74-00306 5B

HEAVY MINERAL SEGREGATION (SEDIMENTATION)

An Experimental Study of Heavy-Mineral Secregation Under Alluvial-Flow Conditions,
W74-00533 2J

HEAVY MINERALS

Selective Transport of Heavy Minerals by Shoaling Waves,
W74-00107 2J

HELMINTHS

Occurrence and Distribution of Helminth Parasites of Fishes from Lake Carl Blackwell, Oklahoma,
W74-00230 5B

HEMLOCK LAKE (MICH)
Effects of Artificial Aeration on the Chemistry and Algae of Two Michigan Lakes,
W74-00048 5C

HERBICIDES
Photodecomposition of the Herbicide Methazole,
W74-00050 5B

The p-Value Approach to Quantitative Liquid-Liquid Extraction of Pesticides and Herbicides from Water. 3. Liquid-Liquid Extraction of Phenoxy Acid Herbicides from Water,
W74-00262 5A

Photolysis of the Herbicide Dinitramine (N3,N3-Diethyl-2,4-Dinitro-6-Trifluoromethyl-M-Phenylenediamine),
W74-00282 5B

Detection of Salts of 2,4-D In Aqueous Solution by Laster Raman Spectroscopy,
W74-00297 5A

Picloram Movement from a Chaparral Watershed,
W74-00370 5B

HERRINGS
Coastal Currents of the Western Gulf of Maine,
W74-00015 2H

HETCH HETCHY VALLEY (CALIF)
Rivers and Americans: A Century of Conflicting Priorities,
W74-00454 6G

HISTORY
The Quest for Water in New Mexico,
W74-00006 6E

HOGS
Problems of Animal Waste Management from the Livestock Feeder Viewpoint,
W74-00134 5G

Waste-Induced Problems of Housed Livestock,
W74-00139 5G

Water Pollution by Swine Production Operations,
W74-00394 5D

A Comparison of Three Systems for Transport and Treatment of Swine Manure,
W74-00416 5D

Effects of Swine Lagoon Effluent on the Soil and Plant Tissue,
W74-00428 5D

HOLLOW FIBERS
Evaluation of Asymmetric Hollow Fibers for Desalination by Reverse Osmosis,
W74-00160 3A

HOLOGRAPHIC MICROSCOPY
Holographic Microscopy of Diatoms,
W74-00247 5C

HONEY PLANTS
Some Characteristics of Nectar Production in the Mountain Honey Plants of Northern Fergana (In Russian),
W74-00235 3F

HONOLULU
Water Quality Program for Oahu with Special Emphasis on Waste Disposal: Final Report.
W74-00456 5D

HORN FLIES (HACMATOBIA IRRITANS)
Toxicity to House Flies and Horn Flies of Manure from Insecticide Fed Cattle,
W74-00423 5G

HOSTS
Occurrence and Distribution of Helminth Parasites of Fishes from Lake Carl Blackwell, Oklahoma,
W74-00230 5B

HOUSE FLIES
Coumaphos as a Feed Additive for the Control of House Fly Larvae in Cow Manure,
W74-00411 5D

HOUSE FLIES (MUSCA DOMESTICA)
Toxicity to House Flies and Horn Flies of Manure from Insecticide Fed Cattle,
W74-00423 5G

HOUSED CONFINEMENT
Waste-Induced Problems of Housed Livestock,
W74-00139 5G

HUMAN FAT
Polychlorinated Terphenyls in the Environment,
W74-00057 5A

HUMAN WASTES
Human and Animal Wastes as Fertilizers,
W74-00419 5D

HUMIC ACIDS
A System for Polyacrylamide Gel Electrophoresis of Humic Acids, (Ein System Zur Polyacrylamidgelelektrophorese Von Huminsauren),
W74-00260 5A

HUNGARY (COUNTY SZOLNOK)
Public Health Consequences of Mass Swarming of Boophthora Erthrocephala (De Geer, 1776) Black Flies in County Szolnok During Floods of 1970,
W74-00477 5G

HYDRAULIC ENGINEERING
Demolition of Ft. Meade Dam, Sturgis, South Dakota, June 1972,
W74-00322 8H

HYDRAULIC STRUCTURES
Mill Creek Fish Passage Facility,
W74-00351 8I

HYDRAULIC SURFACE LOADING
Methods for Improvement of Trickling Filter Plant Performance. Part I. Mechanical and Biological Optima,
W74-00431 5D

HYDROBIOLOGICAL STUDIES
Hydrobiological Investigation of Lake Lere and Neighboring Ponds: I. The Physical Environment, (In French),
W74-00501 2H

HYDROCARBONS
Rate of Evaporation of Low-Solubility Contaminants from Water Bodies to Atmosphere,
W74-00071 5B

Baseline Concentrations of Light Hydrocarbons in Gulf of Mexico,
W74-00073 5B

HYDRODYNAMICS
Experimental Hydrodynamic Calculation of Aperiodic Water-Level Fluctuations in Estuaries,
W74-00114 2L

HYDROELECTRIC POWER
Mathematical Modelling of Capacity Expansion of an Integrated Hydro-Thermal Electrical Power System,
W74-00175 6A

HYDROGEOLOGY
Digital Model of the Hydrologic System, Northern High Plains of Colorado--A Preliminary Report,
W74-00330 2F

HYDROGRAPHY
Environmental Studies of Monterey Bay and the Central California Coastal Zone,
W74-00036 2L

HYDROLOGIC BUDGET
Infiltration Properties of Soils and Intrazonal Structure of the Hydrologic Budget (Infil'tratsionnyye svoystva pochv i vnutrizonal'nyye osobennosti struktury vodnogo balansa),
W74-00341 2G

HYDROLOGIC CYCLE
New Data on Hydrologic Regimen of Lake Sarychelek (Novyye dannyyee po gidrologicheskomu rezhimu oz. Sarychelek),
W74-00342 2H

HYDROLOGIC DATA
Expected Optimum Record Length as a Basis for Hydrologic Network Design,
W74-00178 7C

Hydraulic Testing Accompanying Drilling of Five Exploratory Holes, Piceance Creek Basin, Colorado,
W74-00299 2F

Digital Simulation and Projection of Water-Level Declines in Basalt Aquifers of the Odessa-Lind Area, East-Central Washington,
W74-00326 2F

Water in the San Luis Valley, South-Central Colorado,
W74-00331 2A

Geology and Ground-water Resources of Rush County, Central Kansas,
W74-00352 4B

Ground-water Conditions in Utah, Spring of 1973,
W74-00353 4B

Hydrology and Sediment Transport, Moanalua Valley, Oahu, Hawaii,
W74-00354 2E

A Reconnaissance of the Water Resources in the Pahsimeroi River Basin, Idaho,
W74-00356 2E

Water Resources of the Nisqually Indian Reservation, Washington,
W74-00544 4A

HYDROLOGY
Determination of the Duration of Natural Hydrologic Periods,
W74-00113 2C

HYDROXYLAMINE
The Probable Occurrence of Hydroxylamine in the Water of an Ethiopian Lake,
W74-00067 5A

HYGIENIC ASPECTS
Hygienic Evaluation of the Quality of Water Obtained by Means of Electrodialysis Desalting of Imitation Sea Water, (In Russian),
W74-00478 3A

HYPOLIMNION
Ecology and Production of the Profundal Benthos in Relation to Phytoplankton in Lake Esrom,
W74-00466 5C

HYSTERESIS
Modified Approach to Capillary Hysteresis Based on a Similarity Hypothesis,
W74-00368 2G

ICE
Investigation of Ice Movement on Mountain Glaciers by Stereophotogrammetry (Issledovaniye dvizheniya l'da gornykh lednikov stereofotogrammetricheskim metodom),
W74-00346 2C

ICE COVER
Soluble Particulates in Ice From Site 2, Greenland,
W74-00334 2C

ICHTHYO-FAUNA
Effects of Water Pollution on the Ichthyofauna: IV. Toxicity of Acids, Alkalies and Some Inorganic Gases,
W74-00489 5C

IDAHO
A Reconnaissance of the Water Resources in the Pahsimeroi River Basin, Idaho,
W74-00356 2E

Underground Movement of Wastes Clarified.
W74-00538 5B

ILMENITE
An Experimental Study of Heavy-Mineral Secregation Under Alluvial-Flow Conditions,
W74-00533 2J

INCINERATION
Cost-Effectiveness Analysis of Disposal Systems,
W74-00184 5E

INDEXING
River Mile Index-San Joaquin River, Tulare Lake and Buena Vista Lake Basins, California.
W74-00549 2E

River Mile Index-Klamath River, Pacific Slope Basin, California-Oregon.
W74-00550 2E

INDIA
Achievements of India in the Field of Water Resources Development,
W74-00214 10A

Periodicity of the Blue-Green Algae and Their Effect on the Efficiency of Manure-Disposal Lagoons,
W74-00430 5D

INDIA (KERALA COAST)
Some Studies on Wave Refraction in Relation to Beach Erosion Along the Kerala Coast,
W74-00506 2J

INDIA (WALTAIR BEACH)
Studies on the Currents in the Littoral Zone of the Waltair Beach,
W74-00519 2J

INDIAN OCEAN
Some Studies on Wave Refraction in Relation to Beach Erosion Along the Kerala Coast,
W74-00506 2J

INDIAN RESERVATIONS
Water Resources of the Nisqually Indian Reservation, Washington,
W74-00544 4A

INDUSTRIAL DODECYLBENZENES
Petrochemical Analytical Problems. II. Gas-Liquid Chromatographic-Mass Spectrometric Investigation of Industrial Dodecylbenzenes,
W74-00250 5A

INDUSTRIAL PRODUCTION
Tritium Production.
W74-00009 5B

INDUSTRIAL WASTES
Land Reclamation and River Pollution Problems in the Croal Valley Caused by Waste From Chromate Manufacture,
W74-00045 5C

Apparatus for Removing Oil From Oil-Contaminated Water,
W74-00087 5G

INFILTRATION
Infiltration Properties of Soils and Intrazonal Structure of the Hydrologic Budget (Infil'tratsionnyye svoystva pochv i vnutrizonal'nyye osobennosti struktury vodnogo balansa),
W74-00341 2G

INFORMATION CENTERS AND SERVICES
Development and Pilot-Testing of an Automatic Information Dissemination System.
W74-00003 5D

INFORMATION EXCHANGE
Transfer of Water Resources Knowledge.
W74-00189 10A

Economic Analysis and Municipal Water Supply in Developing Countries,
W74-00190 10A

Research Implementation, A Coordinated Approach,
W74-00191 10A

Water Resources Scientific and Technical Information Display, Storage, and Retrieval,
W74-00192 10A

The Information Science Approach to Transfer of Knowledge,
W74-00193 10A

Transmitting Water Resources Information By a Time-Share System,
W74-00194 10A

Developing a Cooperative Research Program For Flood Control in Brahmaputra Valley,
W74-00195 10A

Application of Hydrogeological Data to Long-Term Economics of Growing Sugar Cane in Venezuela,
W74-00196 10A

Puerto Rico: A Case Study of Water Resource Technology Transfer,
W74-00197 10A

Transfer of Knowledge in Water Resources From Research to Practice,
W74-00198 10A

The Role of the International Commission on Irrigation and Drainage in the Transfer of Water Resources Knowledge,
W74-00199 10A

How Engineering Research is Reduced to Practice in the Bureau of Reclamation,
W74-00200 10A

Research Findings and the Design Engineer,

Transfer of Water Resources Knowledge Aspects of the Work of the United Nations System,
W74-00228 10A

INFORMATION RETRIEVAL
Development and Pilot-Testing of an Automatic Information Dissemination System.
W74-00003 5D

INFORMATION SCIENCE
The Information Science Approach to Transfer of Knowledge,
W74-00193 10A

INFORMATION TRANSFER
An IHD Project for Technology Transfer to Developing Regions,
W74-00222 10A

INFRARED IMAGERY
Water Temperature Surveys in the Vicinity of Power Stations with Special Reference to Infra-Red Techniques,
W74-00076 5A

INFRARED SPECTROPHOTOMETRY
Extraction of Dispersed Oils from Water for Quantitative Analysis by Infrared Spectrophotometry,
W74-00267 5A

INJECTION WELLS
Artificial-Recharge Experiments and Operations on the Southern High Plains of Texas and New Mexico,
W74-00325 4B

INLAND WATERWAYS
Tidal Relations Along the Intracoastal Waterway, Palm Beach, County, Florida,
W74-00328 2L

INLETS (WATERWAYS)
Water-Level Fluctuations and Flow in Tidal Inlets,
W74-00507 2L

INSECTICIDES
Adsorption of Traces of Insecticides from Water on Polyethylene, (Adsorption von Spuren von Insecticiden aus Wasser an Polyathylen),
W74-00259 5A

Degradation of Parathion in Flooded Acid Soils,
W74-00268 5B

Biological Aspects of Agriculture's Effects on Environmental Quality,
W74-00396 5B

Toxicity of Droppings From Coumaphos-Fed Hens to Little House Fly Larvae,
W74-00410 5C

Coumaphos as a Feed Additive for the Control of House Fly Larvae in Cow Manure,
W74-00411 5D

Toxicity to House Flies and Horn Flies of Manure from Insecticide Fed Cattle,
W74-00423 5G

The Application of the Thin-Layer Chromatographic - Enzyme Inhibition Technique to Organochlorine Insecticides,
W74-00461 5A

Two Studies of Pesticide Residues,
W74-00529 5C

A Study of Pesticide Residue Levels and Insecticide Resistance in Selected Aquatic Organisms Occurring Around the Bryan-College Station Agricultural Production areas,
W74-00530 5C

INSTALLATION
Drain Installation for Nitrate Reduction,
W74-00398 5G

INSTRUMENTAL NEUTRON ACTIVATION ANALYSIS
Multielement Instrumental Neutron Activation Analysis of Biological Materials,
W74-00289 2K

INSTRUMENTATION
Use of the Model T Coulter Counter in Size Analysis of Fine to Course Sand,
W74-00103 2J

Reactions and Transport Phenomena, at Surfaces,
W74-00162 3A

INTAKE SYSTEMS
Methods for Controlling Marine Fouling in Intake Systems,
W74-00148 3A

INTAKES
Methods for Controlling Marine Fouling in Intake Systems,
W74-00148 3A

INTERCEPTION
Runoff Formation on Mountain Slopes Under Carpathian Beech and Spruce Forests,
W74-00338 4A

INTERGOVERNMENTAL COORDINATION
Water Development and Urban Recreation,
W74-00446 6B

INTERNAL TIDES
Semidiurnal Internal Tides in Massachusetts Bay,
W74-00504 2L

INTERNATIONAL COMMISSION ON IRRIGATION AND DRAINAGE
The Role of the International Commission on Irrigation and Drainage in the Transfer of Water Resources Knowledge,
W74-00199 10A

INTERNATIONAL COMMISSIONS
Need for Metropolitan Water Balance Inventories,
W74-00187 6A

INTERNATIONAL HYDROLOGICAL DECADE
An IHD Project for Technology Transfer to Developing Regions,
W74-00222 10A

INVENTORIES
Need for Metropolitan Water Balance Inventories,
W74-00187 6A

INVESTIGATIONS
Methods of Karst Investigation (Metody izucheniya karsta),
W74-00345 2K

INVESTMENT
Scheduling and Sequencing in Water Resource Investment Models,
W74-00172 6A

IODOBROMIC WATER
Provoking Effect of Iodobromic Waters in Leprosy, (In Russian),
W74-00403 5C

ION EXCHANGE
Desalination Process,
W74-00081 3A

Ion-Selective Electrochemical Sensors,
W74-00146 3A

Dispersion-Affected Transport of Reacting Solutes in Saturated Porous Media: Galerkin Method Applied to Equilibrium-Controlled Exchange in Unidirectional Steady Water Flow,
W74-00364 5B

ION SELECTIVE ELECTRODES
Ion-Selective Electrochemical Sensors,
W74-00146 3A

ION TRANSPORT
Transport Properties of Charge-Mosaic Membranes-Part A,
W74-00310 3A

Transport Properties of Charge-Mosaic Membranes - Part B,
W74-00311 3A

Dispersion-Affected Transport of Reacting Solutes in Saturated Porous Media: Galerkin Method Applied to Equilibrium-Controlled Exchange in Unidirectional Steady Water Flow,
W74-00364 5B

IONS
Physical and Chemical Limnology of Lake Leake and Tooms Lake, Tasmania,
W74-00283 5C

IRON
The Solvent Extraction of the Ternary Complexes of Iron (II)-Rhodamine B With Various Nitrosophenols. Determination of Iron in Waters,
W74-00288 2K

IRRIGATION
The Role of the International Commission on Irrigation and Drainage in the Transfer of Water Resources Knowledge,
W74-00199 10A

Movement of Pollutant Phosphorus in Saturated Soils,
W74-00392 5B

Effects of Swine Lagoon Effluent on the Soil and Plant Tissue,
W74-00428 5D

Effect of Irrigation and Fertilizer Levels on the Yield and Quality of Groundnut,
W74-00469 3F

Increasing the Effectiveness of Irrigated Agriculture in the Chuy Valley of Kirghizia, (In Russian),
W74-00490 3F

IRRIGATION PRACTICES
Application of Hydrogeological Data to Long-Term Economics of Growing Sugar Cane in Venezuela,
W74-00196 10A

IRRIGATION SYSTEMS
The Quest for Water in New Mexico,
W74-00006 6E

ISOMERIZATION
Isomerization of Gamma-BHC to ALPHA-BHC in the Environment,
W74-00264 5B

IVORY COAST
Litter Decomposition in the Evergreen Rain-Forest of Ivory Coast, (In French),
W74-00494 2I

JACKSON FLOODS (MISS)
Floods in Jackson Quadrangle, Mississippi,
W74-00302 7C

JAMAICA
Holocene Meteoric Dolomitization of Pleistocene Limestones, North Jamaica,
W74-00101 2J

JANESVILLE (WIS.)
Preliminary Report of Public Utilities Analysis.
W74-00458 3D

JAPAN (SAGAMI BAY)
Capacities of Shallow Waters of Sagami Bay for Oxidation and Reduction of Inorganic Nitrogen,
W74-00047 5B

JUPITER ISLAND (FLA)
Beach Nourishment from Offshore Sources,
W74-00522 2J

KANSAS
Municipal Desalting Studies for Selected Kansas Communities,
W74-00156 5F

Geology and Ground-water Resources of Rush County, Central Kansas,
W74-00352 4B

Geohydrology of Doniphan County, Northeastern Kansas,
W74-00536 7C

KARST
Methods of Karst Investigation (Metody izucheniya karsta),
W74-00345 2K

KENTUCKY
Biological Aspects of Agriculture's Effects on Environmental Quality,
W74-00396 5B

KEYSTONE RESERVOIR (OKLA)
Observations on the Nitrogen Fixing Potential of the Surface Waters of a Large Impoundment,
W74-00436 5C

KINETICS
Kinetics of Tritium in Biological Systems.
W74-00011 5B

KLAMATH RIVER BASIN (CALIF AND OREG)
River Mile Index-Klamath River, Pacific Slope Basin, California-Oregon.
W74-00550 2E

LABORATORY EQUIPMENT
Application of High-Speed Liquid Chromatography to Organic Microanalysis. I. Construction of A Simple and Inexpensive Apparatus,
W74-00249 2K

An On-Line Spectrophotometer for Collection of Manipulation of Absorbance Spectra,
W74-00272 7C

Improved Apparatus for Determination of Mercury by Flameless Atomic Absorption,
W74-00276 5A

LABORATORY TESTS
Application of High-Speed Liquid Chromatography to Organic Microanalysis. I. Construction of A Simple and Inexpensive Apparatus,
W74-00249 2K

LAGOONS
Water Pollution by Swine Production Operations,
W74-00394 5D

Effects of Swine Lagoon Effluent on the Soil and Plant Tissue,
W74-00428 5D

Periodicity of the Blue-Green Algae and Their Effect on the Efficiency of Manure-Disposal Lagoons,
W74-00430 5D

LAKE EVAPORATION
Evaporation and Cooling of a Lake Under Unstable Atmospheric Conditions,
W74-00374 2D

LAKE HURON
Lake Huron: Effects of Exploitation, Introductions, and Eutrophication on the Salmoid Community,
W74-00244 5C

LAKE MARY (WIS.)
Some Considerations of the Chemical Limnology of Meromictic Lake Mary,
W74-00064 5C

LAKE MENDOTA (WIS.)
Gas Chromatographic Procedure to Analyze Amino Acids in Lake Waters,
W74-00061 5A

LAKE OKEECHOBEE (FLA)
Lake Okeechobee Seepage Monitoring Network,
W74-00337 4A

LAKE SALLIE (MINN)
Weed Harvest and Lake Nutrient Dynamics,
W74-00150 5C

LAKE SEDIMENTS
Nitrogen Sources and Cycling in Natural Waters,
W74-00149 5C

LAKE SUPERIOR
Evaluation of Commercial Fishery Potential of Wisconsin's Boundary Waters of Lake Superior-Walleye,
W74-00094 8I

LAKE TAHOE
From Resort Area to Urban Recreation Center: Themes in the Development of Lake Tahoe 1946-1956,
W74-00441 6B

LAKES
Lake Okeechobee Seepage Monitoring Network,
W74-00337 4A

New Data on Hydrologic Regimen of Lake Sarychelek (Novyye dannyyee po gidrologicheskomu rezhimu oz. Sarychelek),
W74-00342 2H

Reconstruction of the Water Balance of Lake Balkhash (Rekonstruktsiya vodnogo balansa oz. Balkhash),
W74-00344 2H

Evaporation and Cooling of a Lake Under Unstable Atmospheric Conditions,
W74-00374 2D

LAND DEVELOPMENT
Water Resource Development Problems in a Rural Area in Transition,
W74-00173 6A

LAND RECLAMATION
Land Reclamation and River Pollution Problems in the Croal Valley Caused by Waste From Chromate Manufacture,
W74-00045 5C

LAND USE
Agricultural Water Allocation, Land Use, and Policy,
W74-00186 3F

Land Use as a Factor in Coastal Water Quality,
W74-00383 2L

Skippack Watershed and the Evansburg Project: A Case Study for Water Resources Planning,
W74-00445 6B

Water Development and Urban Recreation,
W74-00446 6B

Comprehensive Plan for Baton Rouge.
W74-00453 3D

Applications of Linear Integer Programming to Problems of Land Use Allocation,
W74-00503 4A

LAND USE PLAN
Comprehensive Plan for Baton Rouge.
W74-00453 3D

LANDFILLS
Solid Waste Management.
W74-00449 5G

LAS VEGAS (NEV)
Report to the Governor and the Interim Finance Committee: Alternative Recommendation, Las Vegas Wash/Bay Pollution Abatement Project.
W74-00440 5D

LASER
Effect of Salinity on the Optical Extinction of Sea Ice at 6328A,
W74-00333 2C

LEACHING
Land Reclamation and River Pollution Problems in the Croal Valley Caused by Waste From Chromate Manufacture,
W74-00045 5C

Effect of Insoluble Grains on Leachate From Porous Beds,
W74-00379 5B

Sulphur Pollution Patterns Observed: Leaching of Calcium in Forest Soil Determined,
W74-00476 5B

LEAD
Improvements in the Manganese Dioxide Collection of Trace Lead and Bismuth in Nickel,
W74-00281 2K

LEGAL ASPECTS
Problems of Animal Waste Management from the Livestock Feeder Viewpoint,
W74-00134 5G

Rules, Regulations and Modes of Procedure, Relating to the Texas Weather Modification Act, V.A.T.S. Water Code, Chapter 14.
W74-00357 3B

LEPROSY
Provoking Effect of Iodobromic Waters in Leprosy, (In Russian),
W74-00403 5C

LIGHT PENETRATION
Biological and Chemical Features of Tidal Estuaries,
W74-00031 2L

Effect of Salinity on the Optical Extinction of Sea Ice at 6328A,
W74-00333 2C

LIME TREATMENT
Pilot Plant Demonstration of Lime-Biological Treatment Phosphorus Removal Method,
W74-00155 5D

LIMESTONES
Holocene Meteoric Dolomitization of Pleistocene Limestones, North Jamaica,
W74-00101 2J

Carbonate Cementation of Some Pleistocene Temperate Marine Sediments,
W74-00106 2J

Regional Specific Yield of the Edwards and Associated Limestones in the San Antonio, Texas Area,
W74-00542 2F

LIMNOLOGY
Physical and Chemical Limnology of Lake Leake and Tooms Lake, Tasmania,
W74-00283 5C

LINDANE
Ultratrace Analysis (Below p.p.b.) by Coupling Centripetal Thin-Layer Chromatography and Gas Chromatography,
W74-00255 5A

LINEAR PROGRAMMING
Studies in the Analysis of Metropolitan Water Resources Systems, Vol. VI Estimating Economies of Scale in Thermal Electric Power Systems Subjected to Environmental Quality Constraints,
W74-00002 6B

Systems Analysis Made Easy for Water Resources Planners,
W74-00167 6A

Flood Control Model for Multi-Reservoir Systems,
W74-00168 4A

Scheduling and Sequencing in Water Resource Investment Models,
W74-00172 6A

Water Resource Development Problems in a Rural Area in Transition,
W74-00173 6A

Joint Use of Screening and Simulation Models in Multiobjective Plan Formulation,
W74-00177 6B

Agricultural Water Allocation, Land Use, and Policy,
W74-00186 3F

Applications of Linear Integer Programming to Problems of Land Use Allocation,
W74-00503 4A

LIPIDS
A Simplified Clean-Up Technique for Organochlorine Residues at the Microliter Level,
W74-00058 5A

Identification of Cutin, a Lipid Biopolymer, as Significant Component of Sewage Sludge,
W74-00072 5A

LIQUID CHROMATOGRAPHY
Application of High-Speed Liquid Chromatography to Organic Microanalysis. I. Construction of A Simple and Inexpensive Apparatus,
W74-00249 2K

LIQUID-LIQUID EXTRACTION
The p-Value Approach to Quantitative Liquid-Liquid Extraction of Pesticides and Herbicides from Water. 3. Liquid-Liquid Extraction of Phenoxy Acid Herbicides from Water,
W74-00262 5A

LIQUID WASTES
Filter Media for Liquid Wastes Treatment and Method of Forming the Same,
W74-00091 5D

LITTER DECOMPOSITION
Litter Decomposition in the Evergreen Rain-Forest of Ivory Coast, (In French),
W74-00494 2I

LITTORAL DRIFT
Reorientation of Convex Shores,
W74-00028 2J

Mechanism of Sand Movement on Coastal Dunes,
W74-00509 2J

Natural Indicators of Estuarine Sediment Movement,
W74-00512 2L

LITTORAL PROCESSES
Coastal Processes and Long Range Planning,
W74-00034 2L

Studies on the Currents in the Littoral Zone of the Waltair Beach,
W74-00519 2J

LIVESTOCK
Proceedings: Livestock Waste Management Research Review.
W74-00125 5G

National Livestock Waste Management Program,

Pollution of Air, Water, and Soil by Livestock,
W74-00128 5G

Application, Utilization and Disposal of Livestock Waste,
W74-00129 5G

Waste-Induced Problems of Housed Livestock,
W74-00139 5G

Concluding Comments,
W74-00144 5G

Agriculture and Environment,
W74-00427 5B

LOADS (FORCES)
Short-Term Snow Loads,
W74-00111 2C

LOCAL GOVERNMENTS
Regional Administrator's Summary,
W74-00141 5G

LONG WAVES
A Method for Determining the Behavior of Long Waves Climbing a Sloping Beach,
W74-00515 2G

LONGSHORE CURRENTS
Probabilities of Wave Characteristics in the Surf Zone,
W74-00018 2H

LONGSHORE TRANSPORT
Quarternary Beaches and Coasts Between the Russian River and Drakes Bay, California,
W74-00019 2J

LOS ANGELES
Demographic Effects of Water Development,
W74-00443 6D

LOUISIANA
Comprehensive Plan for Baton Rouge.
W74-00453 3D

LOWER-MEKONG BASIN
Cost-Effectiveness of Water Resources Systems Design in Developing Countries: Case of the Lower Mekong,
W74-00171 6B

LYSIMETERS
Nitrate Content of Percolates from Manured Lysimeters,
W74-00417 5B

MAGNETITE
An Experimental Study of Heavy-Mineral Secregation Under Alluvial-Flow Conditions,
W74-00533 2J

MAINTAINABILITY
Evaluation of the Reliability and Maintainability of Desalting Plants.
W74-00040 3A

MALACHITE GREEN
Microdetection of Nitrate with Malachite Green or Congo Red,
W74-00273 2K

MANAGEMENT
Georgia's Water Problems and Related Research Needs,
W74-00004 6B

Proceedings: Livestock Waste Management Research Review.
W74-00125 5G

Regional Livestock Waste Management Program,
W74-00127 5G

Design and Management of Runoff Control Systems,
W74-00130 5G

Waste Management and Animal Performance,
W74-00132 5G

Area Director's Summary,
W74-00143 5G

Reliability of Urban Water Quality Management,
W74-00180 5G

Need for Metropolitan Water Balance Inventories,
W74-00187 6A

MANURE TREATMENT
The Influence of Manure Amelioration Treatments on Physical Properties of Sandy Soil, (In Polish),
W74-00484 3F

MAPS
Description of Snow Transport and Snow Deposition in the European USSR,
W74-00112 2C

MARINE ANIMALS
Analysis of Explosives in Sea Water and in Ocean Floor Sediment and Fauna,
W74-00285 5A

MARTHA'S VINEYARD (MASS)
The Environmental Fate of Stranded Crude Oil,
W74-00049 5B

MASS CONTINUITY
The Equations of Mass Continuity and Salt Continuity in Estuaries,
W74-00510 2L

MASS SPECTROMETRY
Organic Pollutant Identification Utilizing Mass Spectrometry,
W74-00309 5A

A Multiparameter Oil Pollution Source Identification System,
W74-00432 5A

MASSACHUSETTS
The Environmental Fate of Stranded Crude Oil,
W74-00049 5B

MASSACHUSETTS BAY
Semidiurnal Internal Tides in Massachusetts Bay,
W74-00504 2L

MATHEMATICAL MODELS
Methodology for Assessing the Potential Impact of Urban Development on Urban Runoff and the Relative Efficiency of Runoff Control Alternatives,
W74-00001 2A

Development and Pilot-Testing of an Automatic Information Dissemination System.
W74-00003 5D

Scheduling and Sequencing in Water Resource Investment Models,
W74-00172 6A

Development and Application of Large-Scale Water and Land Allocation Models for the United States.
W74-00174 6A

Mathematical Modelling of Capacity Expansion of an Integrated Hydro-Thermal Electrical Power System,
W74-00175 6A

Development of Mathematical Modeling Capabilities for the Vistula River Project, Poland,
W74-00218 10A

An Evaluation of Mixing in the Tay Estuary,
W74-00384 2L

A Numerical Model of the St. Lawrence River,
W74-00385 2L

Analytical Modeling of Estuarine Circulation,
W74-00386 2L

Analysis of Animal Waste Storage and Land Disposal Systems,
W74-00393 5D

MATHEMATICAL STUDIES
Rate of Evaporation of Low-Solubility Contaminants from Water Bodies to Atmosphere,
W74-00071 5B

MEASUREMENT
Detection and Measurement.
W74-00010 5B

Environmental Monitoring Techniques.
W74-00013 5B

Water Temperature Surveys in the Vicinity of Power Stations with Special Reference to Infra-Red Techniques,
W74-00076 5A

MEDITERRANEAN SEA
Ciesm and Marine Pollution,
W74-00543 5B

MELT WATER
Polluted Snow in Southern Norway and the Effect of the Meltwater on Freshwater and Aquatic Organisms,
W74-00287 5C

MEMBRANE PROCESSES
Membrane Processes (Osmosis and Reverse Osmosis),
W74-00145 3A

Development of Improved Membranes for Reverse Osmosis,
W74-00159 3A

Transport Properties of Charge-Mosaic Membranes - Part B,
W74-00311 3A

Development of High-Flux Hollow Reverse Osmosis Fibers for Brackish Water Softening,
W74-00314 3A

Research on Reverse Osmosis Membranes for Purification of Wash Water at Sterilization (165 deg F),
W74-00316 5D

Design Integrity and Performance Characteristics of Helical Tubular Module Elements in Reverse Osmosis Plants,
W74-00319 3A

MEMBRANES
Analytical and Experimental Studies of Reverse Osmosis Systems,
W74-00039 3A

Improved Ethyl Cellulose Membranes for Reverse Osmosis Application,
W74-00157 3A

New Membrane Compositions for Desalination of Water by Reverse Osmosis,
W74-00158 3A

Evaluation of Asymmetric Hollow Fibers for Desalination by Reverse Osmosis,
W74-00160 3A

Hydrocasting Reverse Osmosis Membranes, Development of Porous Support Tubes, Study of Mechanism of Membrane Formation and Development of Non-Cellulosic Desalination Membranes,
W74-00161 3A

Transport Properties of Charge-Mosaic Membranes-Part A,
W74-00310 3A

New Polymer Membrane Technology for Desalination of Seawater by Reverse Osmosis,
W74-00312 3A

Fabrication and Testing of Tubular Reverse Osmosis Modules Containing Ultrathin Membranes for Wet-Dry Cycling Operations,
W74-00313 5F

Research on Composite Hollow Tubules,
W74-00315 3A

Research on Reverse Osmosis Membranes for Purification of Wash Water at Sterilization (165 deg F),
W74-00316 5D

Research on Composite Hollow Tubulets,
W74-00317 3A

Research on Advanced Membranes for Reverse Osmosis,
W74-00318 3A

Definition of Reverse Osmosis Requirements for Spacecraft Wash Water Recycling,
W74-00320 5D

MERCURY
The Rate of Loss of Mercury From Aqueous Solution When Stored in Various Containers,
W74-00043 5A

Sampling the Edible Muscle of the Swordfish (Xiphias gladius) for Total Mercury Analysis,
W74-00052 5A

Studies in Sweden on Feasibility of Some Methods for Restoration of Mercury-Contaminated Bodies of Water,
W74-00060 5G

Improved Apparatus for Determination of Mercury by Flameless Atomic Absorption,
W74-00276 5A

Mercury: Environmental Considerations, Part I,
W74-00292 5C

The Extraction of Mercury From Aqueous Solution with Sulfide-Treated Polyurethane Foam,
W74-00459 5A

MEROMIXIS
Some Considerations of the Chemical Limnology of Meromictic Lake Mary,
W74-00064 5C

MESITYL OXIDE
Mesityl Oxide as an Extracting Agency for Beryllium,
W74-00280 2K

METABOLISM
Isomerization of Gamma-BHC to ALPHA-BHC in the Environment,
W74-00264 5B

Utilization of Different Levels of Poultry Litter Nitrogen by Sheep,
W74-00401 5G

Metabolic Effects of Technical Pentachlorophenol (PCP) on the Eel Anguilla anguilla L.,
W74-00482 5C

METABOLITES
Photodecomposition of the Herbicide Methazole,
W74-00050 5B

METAL COMPLEXES
The Solvent Extraction of the Ternary Complexes of Iron (II)-Rhodamine B With Various Nitrosophenols. Determination of Iron in Waters,
W74-00288 2K

METALS
A Study of the Variation with pH of the Solubility and Stability of Some Metal Ions at Low Concentrations in Aqueous Solution. Part II,
W74-00261 5A

A Comparison of A Wet Pressure Digestion Method with Other Commonly Used Wet and Dry-Ashing Methods,
W74-00462 5A

METHAZOLE
Photodecomposition of the Herbicide Methazole,
W74-00050 5B

METHODOLOGY
Gas Chromatographic Procedure to Analyze Amino Acids in Lake Waters,
W74-00061 5A

Water Temperature Surveys in the Vicinity of Power Stations with Special Reference to Infra-Red Techniques,
W74-00076 5A

Gas Chromatographic Determination of Aliphatic Amines and Quantitative Analysis of Small Amounts of Dimethylamine in Wastewater,

METHOXYCHLOR
Dispersion and Transport of Rhodamine B Dye and Methoxychlor in Running Water: A Preliminary Study,
W74-00279 5B

METHYLATION
Studies in Sweden on Feasibility of Some Methods for Restoration of Mercury-Contaminated Bodies of Water,
W74-00060 5G

METHYLMERCURY
Methylmercury as Percentage of Total Mercury in Flesh and Viscera of Salmon and Sea Trout of Various Ages,
W74-00079 5C

The Extraction of Mercury From Aqueous Solution with Sulfide-Treated Polyurethane Foam,
W74-00459 5A

MICHIGAN
Effects of Artificial Aeration on the Chemistry and Algae of Two Michigan Lakes,
W74-00048 5C

Parasites, Disease, and Disease Control of Great Lakes Anadromous and Commercial Fish,
W74-00229 5C

Applications of Linear Integer Programming to Problems of Land Use Allocation,
W74-00503 4A

MICROBIAL DEGRADATION
Isomerization of Gamma-BHC to ALPHA-BHC in the Environment,
W74-00264 5B

Degradation of Parathion in Flooded Acid Soils,
W74-00268 5B

Biodegradability of Nonionic Surfactants: Screening Test for Predicting Rate and Ultimate Biodegradation,
W74-00269 5B

MICROCOCCI
Staphylococci and Micrococci In Swimming-Bath Water, (In German),
W74-00277 5A

MICROSCOPY
Holographic Microscopy of Diatoms,
W74-00247 5C

MIDGES
Relations Between Host Plants and Phenology of the Gall Midges Contarinia Tritici (Kirby) and Sitodiplosis Mosellana (Geh.), (In German),
W74-00388 3F

MILK
The Effect of KCl in Drinking Water on Milk Secretion and Composition, (In Rumanian),
W74-00483 5C

MINERAL WATER
The Dushanbe Artesian Basin and Its Mineral and Thermal Waters (Dushanbinskiy artezianskiy basseyn i yego mineral'nyye i termal'nyye vody),
W74-00117 4B

MINERALOGY
Mineralogy of Parent Materials, Topsoils and Erosion Products of Taita Experimental Station,
W74-00182 2G

An Experimental Study of Heavy-Mineral Secregation Under Alluvial-Flow Conditions,
W74-00533 2J

MINERALS
Contribution to the Knowledge of Mineral Nitrogen Dynamics in a Grey Ferruginous Soil at Nioro-Du-Rip (Senegal), (In French),
W74-00062 3F

MINNEAPOLIS (MINN.)
Solid Waste Management.
W74-00449 5G

Metropolitan Council Five-Year Capital Improvement Program for Sewerage Facilities.
W74-00450 5G

Metropolitan Development Guide, Water Resources Policy Plan, Program.
W74-00451 6B

Sewage and Waste Control Rules and Regulations for the Metropolitan Disposal System.
W74-00452 5G

MINNESOTA
Weed Harvest and Lake Nutrient Dynamics,
W74-00150 5C

Rates of Photosynthesis and Phytoplankton Growth in Shagawa Lake, Minnesota,
W74-00151 5C

Solid Waste Management.
W74-00449 5G

Metropolitan Council Five-Year Capital Improvement Program for Sewerage Facilities.
W74-00450 5G

Metropolitan Development Guide, Water Resources Policy Plan, Program.
W74-00451 6B

Sewage and Waste Control Rules and Regulations for the Metropolitan Disposal System.
W74-00452 5G

MISSION PENINSULA (MICH)
Applications of Linear Integer Programming to Problems of Land Use Allocation,
W74-00503 4A

MISSISSIPPI
Interaction of Bulk Precipitation, Stream Water, and Sewage in a Small Watershed Near Oxford, Mississippi,
W74-00005 2A

Floods in Jackson Quadrangle, Mississippi,
W74-00302 7C

MIXING
Experimental and Mathematical Modeling of Liquid-Liquid Miscible Displacement in Porous Media,
W74-00366 2F

An Evaluation of Mixing in the Tay Estuary,
W74-00384 2L

Processes Affecting Seawater Characteristics Along the Oregon Coast,
W74-00520 2E

A Test of Mixing Length Theories in a Coastal Plain Estuary,
W74-00528 2L

MIXING LENGTH
A Test of Mixing Length Theories in a Coastal Plain Estuary,
W74-00528 2L

MOANALUA VALLEY (HAWAII)
Hydrology and Sediment Transport, Moanalua Valley, Oahu, Hawaii,
W74-00354 2E

MOBILIZATION
Studies in Sweden on Feasibility of Some Methods for Restoration of Mercury-Contaminated Bodies of Water,
W74-00060 5G

MODEL STUDIES
Joint Use of Screening and Simulation Models in Multiobjective Plan Formulation,
W74-00177 6B

Navigation Conditions at Confluence of Arkansas, Verdigris, and Grand Rivers,
W74-00539 8B

MOISTURE CONTENT
Use of the Gamma Field of the Earth to Determine the Water Content of Soils,
W74-00108 2G

MOLE DRAINAGE
Observations on the Soil-Water Regimes in a Drained Clay Soil,
W74-00359 2G

MOLLUSK
Differences in Littoral Fauna Due to Fluctuating Water Levels Below A Hydroelectric Dam,
W74-00463 2I

MOLLUSKS
Organochlorine Residues in Estuarine Mollusks, 1965-72 - National Pesticide Monitoring Program,
W74-00291 5C

MONITORING
Detection and Measurement.
W74-00010 5B

Environmental Monitoring Techniques.
W74-00013 5B

Detection of Trace Amounts of Oil in Sea Water by Fluorescence Spectroscopy,
W74-00059 5A

Dispersion and Transport of Rhodamine B Dye and Methoxychlor in Running Water: A Preliminary Study,
W74-00279 5B

Movement of Pollutant Phosphorus in Saturated Soils,
W74-00392 5B

Bacterial Flagellar Uncoordination as a Monitor for Industrial Pollutants,
W74-00438 5B

MONOMOLECULAR FILMS
Evaporation Retardation by Monomolecular Layers,
W74-00373 3B

MONTANA
Water Resource Development Problems in a Rural Area in Transition,
W74-00173 6A

MORTALITY
Coumaphos as a Feed Additive for the Control of House Fly Larvae in Cow Manure,
W74-00411 5D

Effect of Bacillus Thuringiensis in Cattle Manure on House Fly Larvae,
W74-00414 5G

MOUNTAIN FORESTS
Spring Runoff From Small Catchments with Different Forest Cover in the Mountains of Georgia,
W74-00339 4A

MULTIELEMENTAL ANALYSIS
Multielement Instrumental Neutron Activation Analysis of Biological Materials,
W74-00289 2K

MULTINODAL SPECTRA
Characteristics of Wave Records in the Coastal Zone,
W74-00033 2H

MULTIPLE-PURPOSE PROJECTS
The Development of Methods for the Planning of Utilisation and Protection of Yugoslav Water Resources.
W74-00170 6A

MULTIVARIATE REGRESSION ANALYSIS
Water Resource Development Problems in a Rural Area in Transition,
W74-00173 6A

MUNICIPAL WASTES
Inorganic and Organic Phosphorus Distribution in Domestic and Municipal Sewage,
W74-00055 5B

MUNICIPAL WATER
Engineering Alternatives in Natural Resources Development in Urban Regions,
W74-00122 5D

Need for Metropolitan Water Balance Inventories,
W74-00187 6A

Economic Analysis and Municipal Water Supply in Developing Countries,
W74-00190 10A

MUSCA DOMESTICA L.
Effect of Bacillus Thuringiensis in Cattle Manure on House Fly Larvae,
W74-00414 5G

MUSCLE
Sampling the Edible Muscle of the Swordfish (Xiphias gladius) for Total Mercury Analysis,
W74-00052 5A

MUTATIONS
Mutations Arising During Transformation in the Blue-Green Alga Anacystis nidulans,
W74-00234 5C

NANNOPLANKTON
Role of Ultranannoplankton Algae in Primary Production in Lake Baikal During the Summer, (In Russian),
W74-00488 2H

NARRAGANSETT BAY (R.I.)
Association of Hydrocarbons and Mineral Particles in Saline Solution,
W74-00265 5B

NASHVILLE (TENN.)
Natural Environmental Analysis, Nashville-Davidson County, Tennessee.
W74-00455 3D

NATIONAL REACTOR TESTING STATION (IDAHO)
Underground Movement of Wastes Clarified.
W74-00538 5B

NATURAL WATERS
On the Quantitative Determination of Free Carbon Dioxide in Natural Waters, (Zur quantitativen Bestimmung der freien Kohlensaure in naturlichen Wassern),
W74-00263 2K

NAVIGATION
Navigation Conditions at Confluence of Arkansas, Verdigris, and Grand Rivers,
W74-00539 8B

NEAR SHORE CIRCULATION
Wave Induced Circulation and Longshore Current Patterns in the Coastal Zone,
W74-00023 2L

NEAR SHORE PROCESSES
Coastal Currents of the Western Gulf of Maine,
W74-00015 2H

A Time Series from the Beach Environment,
W74-00017 2J

Probabilities of Wave Characteristics in the Surf Zone,
W74-00018 2H

Quarternary Beaches and Coasts Between the Russian River and Drakes Bay, California,
W74-00019 2J

Sand Movement in Relation to Beach Topography,
W74-00020 2J

Theoretical and Experimental Study of Wave Enhancement and Runup on Uniformly Sloping Impermeable Beaches,
W74-00022 2H

Wave Induced Circulation and Longshore Current Patterns in the Coastal Zone,
W74-00023 2L

A Computer Program to Estimate the Combined Effect of Refraction and Diffraction of Water Waves,
W74-00024 2L

Dynamics of Swash and Implication to Beach Response,
W74-00032 2J

Characteristics of Wave Records in the Coastal Zone,
W74-00033 2H

Climb of a Bore on a Beach. Part I. Uniform Beach Slope,
W74-00035 2L

Environmental Studies of Monterey Bay and the Central California Coastal Zone,
W74-00036 2L

Seasonal Variations of Coastal Currents Off the Oregon - Northern California Coast,
W74-00037 2L

Long Term Changes in Marine Ecosystem: Ecological Relationships Between Tomales Bay and Adjacent Shelf Waters,
W74-00038 2L

On the Angular Energy Spectrum of Wind Waves,
W74-00505 2E

Some Studies on Wave Refraction in Relation to Beach Erosion Along the Kerala Coast,
W74-00506 2J

Mechanism of Sand Movement on Coastal Dunes,
W74-00509 2J

Natural Indicators of Estuarine Sediment Movement,
W74-00512 2L

Initial Wave Scattering by an Inhomogeneous Medium and its Application to Shallow Water Waves,
W74-00513 2L

A Method for Determining the Behavior of Long Waves Climbing a Sloping Beach,
W74-00515 2G

Formation of Thermal Microstructure in a Narrow Embayment During Flushing,
W74-00517 2L

Some Aspects of Wave Action on a Gently Sloping Sandy Beach,
W74-00527 2E

NECTAR
Some Characteristics of Nectar Production in the Mountain Honey Plants of Northern Fergana (In Russian),
W74-00235 3F

NET BENEFITS
Optimization of Multiple Reservoir System,
W74-00188 4A

NETWORK DESIGN
Stream Gauging Information, Australia--Supplement 1971.
W74-00350 7C

NETWORKS
Expected Optimum Record Length as a Basis for Hydrologic Network Design,
W74-00178 7C

NEUTRON ACTIVATION ANALYSIS
Methylmercury as Percentage of Total Mercury in Flesh and Viscera of Salmon and Sea Trout of Various Ages,
W74-00079 5C

NEVADA
Calcium Carbonate Cementation of Alluvial Fans in Southern Nevada,
W74-00349 2K

Report to the Governor and the Interim Finance Committee: Alternative Recommendation, Las Vegas Wash/Bay Pollution Abatement Project.
W74-00440 5D

From Resort Area to Urban Recreation Center: Themes in the Development of Lake Tahoe 1946-1956,
W74-00441 6B

NEW JERSEY
Tropical Cyclone Precipitation in New Jersey,
W74-00435 2B

NEW MEXICO
The Quest for Water in New Mexico,
W74-00006 6E

Chemical and Biological Character of Rio Grande Water in the Bosque Del Apache Wildlife Refuge,
W74-00007 4A

Artificial-Recharge Experiments and Operations on the Southern High Plains of Texas and New Mexico,
W74-00325 4B

An Experimental Study of Heavy-Mineral Secregation Under Alluvial-Flow Conditions,
W74-00533 2J

NEW RIVER (SC)
A Systematic Survey of Intertidal Oysters in the Savannah River Basin Area of South Carolina,
W74-00300 5C

NEW YORK
Studies in the Analysis of Metropolitan Water Resources Systems, Vol. VI Estimating Economies of Scale in Thermal Electric Power Systems Subjected to Environmental Quality Constraints,
W74-00002 6B

Glue Treatment-Pick a Way,
W74-00165 5D

Water Chemistry of Ellicott Creek, Western New York,
W74-00166 5A

Flood of June 1972 at Elmira, New York,
W74-00535 7C

NEW ZEALAND (HAWKE BAY)
Wave Refraction Patterns in Hawke Bay,
W74-00518 2L

NEW ZEALAND (OTAGO PENINSULA)
Coastal Processes Around the Otago Peninsula,
W74-00521 2J

NEW ZELAND
Mineralogy of Parent Materials, Topsoils and Erosion Products of Taita Experimental Station,
W74-00182 2G

NICKEL
Improvements in the Manganese Dioxide Collection of Trace Lead and Bismuth in Nickel,
W74-00281 2K

NISQUALLY INDIAN RESERVATION (WASH)
Water Resources of the Nisqually Indian Reservation, Washington,
W74-00544 4A

NITRATES
Nitrate and Nitrite Volatilization by Microorganisms in Laboratory Experiments,
W74-00008 5G

Ground-Water Nitrate Pollution in Rural Areas,
W74-00095 5B

Nitrate Content of Well Water in West-Central Wisconsin,
W74-00246 5B

Voltammetric Determination of Nitrate and Nitrite Ions Using a Rotating Cadmium Disk Electrode,
W74-00251 2K

Effect of Agricultural Management of Wet Sloping Soil on Nitrate and Phosphorus in Surface and Subsurface Water,
W74-00371 5B

Drain Installation for Nitrate Reduction,
W74-00398 5G

Soil Conditions Under Feedlots and on Land Treated with Large Amounts of Animal Wastes,
W74-00399 5B

Nitrate Content of Percolates from Manured Lysimeters,
W74-00417 5B

Agriculture and Environment,
W74-00427 5B

NITRILOTRIACETIC ACID
A Fluorometric Method for the Determination of Nitrilotriacetic Acid,
W74-00274 5A

Determination and Differentiation of Ethylenediaminetetra-Acetic Acid (EDTA) and Nitrilotriacetic Acid (NTA) in Freshwater,
W74-00295 5A

NITRITES
Nitrate and Nitrite Volatilization by Microorganisms in Laboratory Experiments,
W74-00008 5G

NITRITES

Voltammetric Determination of Nitrate and Nitrite Ions Using a Rotating Cadmium Disk Electrode,
W74-00251 2K

Microdetection of Nitrate with Malachite Green or Congo Red,
W74-00273 2K

NITROGEN

Soil Denitrification in Sealed Soil-Plant Systems: II. Effect of Soil Water Content and Form of Applied Nitrogen,
W74-00014 2G

Soil Dentrification in Sealed Soil-Plant Systems: III. Effect of Disturbed and Undisturbed Soil Samples,
W74-00025 2G

Capacities of Shallow Waters of Sagami Bay for Oxidation and Reduction of Inorganic Nitrogen,
W74-00047 5B

Contribution to the Knowledge of Mineral Nitrogen Dynamics in a Grey Ferruginous Soil at Nioro-Du-Rip (Senegal), (In French),
W74-00062 3F

Utilization of Different Levels of Poultry Litter Nitrogen by Sheep,
W74-00401 5G

Nitrogen Compounds in Natural Water--A Review,
W74-00402 5B

Enrichment of the Atmosphere with Nitrogen Compounds Volatilized From a Large Dairy Area,
W74-00409 5B

Dehydrated Poultry Manure as a Crude Protein Supplement for Sheep,
W74-00413 5G

NITROGEN CYCLE

Nitrate and Nitrite Volatilization by Microorganisms in Laboratory Experiments,
W74-00008 5G

Nitrogen Sources and Cycling in Natural Waters,
W74-00149 5C

Nitrogen Compounds in Natural Water--A Review,
W74-00402 5B

NITROGEN FERTILIZER

Yield and Chemical Composition of Cocksfoot in Dependence of Nitrogen Fertilization and Water Supply, (In Research),
W74-00491 3F

NITROGEN FIXATION

Nitrogen Sources and Cycling in Natural Waters,
W74-00149 5C

Observations on the Nitrogen Fixing Potential of the Surface Waters of a Large Impoundment,
W74-00436 5C

NITROGEN RETENTION

Observations on the Effect of Protein Intake and Stage of Gestation on the Proportion of Urinary Nitrogen Excreted as Urea in Sheep,
W74-00408 5B

NITROSOPHENOLS

The Solvent Extraction of the Ternary Complexes of Iron (II)-Rhodamine B With Various Nitrosophenols. Determination of Iron in Waters,
W74-00288 2K

NONIONIC DETERGENTS

Biodegradability of Nonionic Surfactants: Screening Test for Predicting Rate and Ultimate Biodegradation,
W74-00269 5B

NORTH CAROLINA

Water Pollution by Swine Production Operations,
W74-00394 5D

NORWAY

Cadmium Concentrations in Some Fish Species from A Coastal Area in Southern Norway,
W74-00257 5A

Polluted Snow in Southern Norway and the Effect of the Meltwater on Freshwater and Aquatic Organisms,
W74-00287 5C

Sulphur Pollution Patterns Observed: Leaching of Calcium in Forest Soil Determined,
W74-00476 5B

NOXIOUS SUBSTANCES

Noxious Substances Contained in the Waters: Their Origin, Bearing, and Their Elimination, (In German),
W74-00065 5B

NUCLEAR DETONATION

Tritium Production.
W74-00009 5B

NUCLEAR EXPLOSION

Summary of Chemical and Radiochemical Monitoring of Water for the Cannikin Event, Amchitka Island, Alaska, Fiscal Year 1972,
W74-00547 5B

NUCLEAR POWERPLANTS

Tritium Production.
W74-00009 5B

Water Temperature Surveys in the Vicinity of Power Stations with Special Reference to Infra-Red Techniques,
W74-00076 5A

NUCLEAR REACTORS

Underground Movement of Wastes Clarified.
W74-00538 5B

NUCLEAR WASTES

Underground Movement of Wastes Clarified.
W74-00538 5B

NUMERICAL ANALYSIS

Analytical Solutions to the One-Dimensional Nonlinear Diffusion Equation for Flow Through Porous Media,
W74-00365 2F

Method for Numerical Simulation of Flow in Multiaquifer Systems,
W74-00382 2F

NUTRIENT REMOVAL

Weed Harvest and Lake Nutrient Dynamics,
W74-00150 5C

Pilot Plant Demonstration of Lime-Biological Treatment Phosphorus Removal Method,
W74-00155 5D

Loss of Particulate Organic Materials from Semiarid Watersheds as a Result of Extreme Hydrologic Events,
W74-00378 2A

Nutrient Losses After Clear-Cut Logging and Slash Burning in the Oregon Coast Range,
W74-00381 4C

Periodicity of the Blue-Green Algae and Their Effect on the Efficiency of Manure-Disposal Lagoons,
W74-00430 5D

NUTRIENTS

Nutrient Factors Limiting Primary Productivity in Simulated and Field Antarctic Microecosystems,
W74-00069 5C

Nitrogen Sources and Cycling in Natural Waters,
W74-00149 5C

Weed Harvest and Lake Nutrient Dynamics,
W74-00150 5C

New Feedlot Concept Uses Converted Manure as Feed,
W74-00415 5D

Manuring of Potatoes on Fen Silt Soils in Holland, Lincolnshire,
W74-00422 3F

Effects of Swine Lagoon Effluent on the Soil and Plant Tissue,
W74-00428 5D

OAHU

Water Quality Program for Oahu with Special Emphasis on Waste Disposal: Final Report.
W74-00456 5D

OAK

Comparative Characteristics of Ecological Conditions in Annual Clearing and Under a Canopy in Dry Cotinus Oak Woods, (In Russian),
W74-00487 2I

OAK FOREST

Water Content in a Phytocoenosis, and Water Budget of a Ecosystem; Oak-Forest of Virelles, (In French),
W74-00474 2I

OATS

Effect of Soil Drought on Water Availability and Plant Growth, (In Russian),
W74-00475 3F

OCEAN CURRENTS

Wave Induced Circulation and Longshore Current Patterns in the Coastal Zone,
W74-00023 2L

OCEAN WAVES

Wave Induced Circulation and Longshore Current Patterns in the Coastal Zone,
W74-00023 2L

Characteristics of Wave Records in the Coastal Zone,
W74-00033 2H

On the Angular Energy Spectrum of Wind Waves,
W74-00505 2E

Some Aspects of Wave Action on a Gently Sloping Sandy Beach,
W74-00527 2E

OCEANOGRAPHY
Determination of the Duration of Natural Hydrologic Periods,
W74-00113 2C

In Situ Measurement of Sediment Sound Speed During Coring,
W74-00294 2J

OCEANS
Ciesm and Marine Pollution,
W74-00543 5B

ODESSA-LIND AREA (WASH)
Digital Simulation and Projection of Water-Level Declines in Basalt Aquifers of the Odessa-Lind Area, East-Central Washington,
W74-00326 2F

OHIO
Availabiiity of Water from Limestone and Dolomite Aquifers in Southwest Ohio and the Relation of Water Quality to the Regional Flow System,
W74-00336 4B

Ground Water Recharge, Southern Regional District, Montgomery County, Ohio, Engineering Study and Report, Phase I.
W74-00439 4B

OIL
Extraction of Dispersed Oils from Water for Quantitative Analysis by Infrared Spectrophotometry,
W74-00267 5A

Conversion of Urban Refuse to Oil,
W74-00406 5D

OIL CHARACTERIZATION
Compositional Studies of a High-Boiling 370-535 C Distillate from Prudhoe Bay, Alaska, Crude Oil,
W74-00258 5A

OIL POLLUTION
Detection of Trace Amounts of Oil in Sea Water by Fluorescence Spectroscopy,
W74-00059 5A

Poliution Skimmer,
W74-00084 5G

Converging Vortex Apparatus for Separating oil from Water,
W74-00085 5G

Separating Apparatus,
W74-00086 5G

Apparatus for Removing Oil From Oil-Contaminated Water,
W74-00087 5G

Oil Recovery Vessel,
W74-00089 5G

Floating Oil Containment Boom,
W74-00090 5G

OIL REMOVAL
Enzymatic Removal of Oil Slicks,
W74-00284 5G

OIL SPILLS
The Environmental Fate of Stranded Crude Oil,
W74-00049 5B

Pollution Skimmer,
W74-00084 5G

Separating Apparatus,
W74-00086 5G

Oil Recovery Vessel,
W74-00089 5G

Floating Oil Containment Boom,
W74-00090 5G

Enzymatic Removal of Oil Slicks,
W74-00284 5G

A Multiparameter Oil Pollution Source Identification System,
W74-00432 5A

OIL WASTES
Hygienic Efficacy of Sanitary Protection Measures for Surface Waters in the Region of Oil-Refining and Oil-Chemical Enterprises, (In Russian),
W74-00241 5B

OILY WATER
Apparatus for Removing Oil From Oil-Contaminated Water,
W74-00087 5G

Extraction of Dispersed Oils from Water for Quantitative Analysis by Infrared Spectrophotometry,
W74-00267 5A

OKLAHOMA
Occurrence and Distribution of Helminth Parasites of Fishes from Lake Carl Blackwell, Oklahoma,
W74-00230 5B

Observations on the Nitrogen Fixing Potential of the Surface Waters of a Large Impoundment,
W74-00436 5C

Reconnaissance of the Water Resources of Beaver County, Oklahoma,
W74-00534 7C

Navigation Conditions at Confluence of Arkansas, Verdigris, and Grand Rivers,
W74-00539 8B

Variation of the Low Level Winds During the Passage of a Thunderstorm Gust Front,
W74-00545 2B

OLIGOCHAETE
Differences in Littoral Fauna Due to Fluctuating Water Levels Below A Hydroelectric Dam,
W74-00463 2I

OLIGOTROPHY
Distribution of Peat Bogs on Earth, Their Types and Characteristics, (In Russian),
W74-00147 2H

ON-LINE SYSTEMS
An On-Line Spectrophotometer for Collection of Manipulation of Absorbance Spectra,
W74-00272 7C

OPERATING COSTS
Estimating Regional Wastewater Treatment Costs,
W74-00169 5D

Capital and Operating Costs of Pollution Control Equipment Modules, Volume I, USER GUIDE,
W74-00307 5G

Capital and Operating Costs of Pollution Control Equipment Modules, Volume II, DATA MANUAL,
W74-00308 5G

OPERATING POLICY
Optimization of Multiple Reservoir System,
W74-00188 4A

OPERATIONS
Methods for Improvement of Trickling Filter Plant Performance. Part I. Mechanical and Biological Optima,
W74-00431 5D

OPERATIONS RESEARCH
Systems Analysis Made Easy for Water Resources Planners,
W74-00167 6A

OPTICAL PROPERTIES
Effect of Salinity on the Optical Extinction of Sea Ice at 6328A,
W74-00333 2C

OPTIMIZATION
The Development of Methods for the Planning of Utilisation and Protection of Yugoslav Water Resources.
W74-00170 6A

Optimal Allocation of Limited Water Resources,
W74-00179 6A

Reliability of Urban Water Quality Management,
W74-00180 5G

OPTIMUM DEVELOPMENT PLANS
Cost-Effectiveness of Water Resources Systems Design in Developing Countries: Case of the Lower Mekong,
W74-00171 6B

OREGON
Nutrient Losses After Clear-Cut Logging and Slash Burning in the Oregon Coast Range,
W74-00381 4C

Natural Indicators of Estuarine Sediment Movement,
W74-00512 2L

Processes Affecting Seawater Characteristics Along the Oregon Coast,
W74-00520 2E

River Mile Index-Klamath River, Pacific Slope Basin, California-Oregon.
W74-00550 2E

ORGANIC COMPOUNDS
Application of High-Speed Liquid Chromatography to Organic Microanalysis. I. Construction of A Simple and Inexpensive Apparatus,
W74-00249 2K

Association of Hydrocarbons and Mineral Particles in Saline Solution,
W74-00265 5B

Organic Pollutant Identification Utilizing Mass Spectrometry,
W74-00309 5A

Preparative Free-Flow Electrophoresis as a Method of Fractionation of Natural Organic Materials,
W74-00321 2K

ORGANIC MATTER
Interaction of Yellow Organic Acids with Calcium Carbonate in Freshwater,
W74-00068 5B

ORGANIC PESTICIDES
Organic Pollutant Identification Utilizing Mass Spectrometry,
W74-00309 5A

ORGANIC PHOSPHORUS
Inorganic and Organic Phosphorus Distribution in Domestic and Municipal Sewage,
W74-00055 5B

ORGANOCHLORINE RESIDUES
A Simplified Clean-Up Technique for Organochlorine Residues at the Microliter Level,
W74-00058 5A

ORGANOMERCURY COMPOUNDS
Gas-Liquid Chromatography-Mass Spectrometry of Organomercury Compounds,
W74-00253 5A

Mercury: Environmental Considerations, Part I,
W74-00292 5C

ORTHOPHOSPHATES
Determination of Orthophosphate,
W74-00464 5A

OSMOSIS
Membrane Processes (Osmosis and Reverse Osmosis),
W74-00145 3A

Hydrocasting Reverse Osmosis Membranes, Development of Porous Support Tubes, Study of Mechanism of Membrane Formation and Development of Non-Cellulosic Desalination Membranes,
W74-00161 3A

OUTBOARD MOTORS
A Review of Outboard Motor Effects on the Aquatic Environment,
W74-00063 5C

OUTDOOR RECREATION
Water Development and Urban Recreation,
W74-00446 6B

OUTFALL SEWERS
Water Quality and Fish Life Below Sewage Outfalls,
W74-00248 5C

OUTLETS
Water Quality and Fish Life Below Sewage Outfalls,
W74-00248 5C

OVERLAND FLOW
Loss of Particulate Organic Materials from Semiarid Watersheds as a Result of Extreme Hydrologic Events,
W74-00378 2A

OXFORD (MISS)
Interaction of Bulk Precipitation, Stream Water, and Sewage in a Small Watershed Near Oxford, Mississippi,
W74-00005 2A

OXIDATION
Capacities of Shallow Waters of Sagami Bay for Oxidation and Reduction of Inorganic Nitrogen,
W74-00047 5B

OXIDATION LAGOONS
A Recycled Feed Source From Aerobically Processed Swine Wastes,
W74-00412 5D

A Comparison of Three Systems for Transport and Treatment of Swine Manure,
W74-00416 5D

OYSTERS
Polychlorinated Terphenyls in the Environment,
W74-00057 5A

A Systematic Survey of Intertidal Oysters in the Savannah River Basin Area of South Carolina,
W74-00300 5C

P-CRESOL
The Chemistry and Quantitative Utility of Sodium Cobaltinitrite in the Determination of Phenols,
W74-00465 5A

PACIFIC SOUTHWEST
River Mile Index-San Joaquin River, Tulare Lake and Buena Vista Lake Basins, California.
W74-00549 2E

PAHSIMEROI RIVER BASIN (IDAHO)
A Reconnaissance of the Water Resources in the Pahsimeroi River Basin, Idaho,
W74-00356 2E

PALM BEACH COUNTY (FLA.)
Tidal Relations Along the Intracoastal Waterway, Palm Beach, County, Florida,
W74-00328 2L

PARAMETRIC ANALYSIS
Reliability of Urban Water Quality Management,
W74-00180 5G

PARATHION
Degradation of Parathion in Flooded Acid Soils,
W74-00268 5B

PARTICLE SHAPE
Whistling Sand Beaches in the British Isles,
W74-00104 2J

Settling Behaviour Related to Sieve Analysis of Skeletal Sands,
W74-00105 2J

PARTICLE SIZE
Grain Size Studies on Turbidite Components From Tyrrhenian Deep Sea Cores,
W74-00100 2J

Whistling Sand Beaches in the British Isles,
W74-00104 2J

Settling Behaviour Related to Sieve Analysis of Skeletal Sands,
W74-00105 2J

PARTICLE SIZE ANALYSIS
Use of the Model T Coulter Counter in Size Analysis of Fine to Course Sand,
W74-00103 2J

PARVIN LAKE (COLO.)
Effects of Artificial Destratification on Zooplankton in Parvin Lake, Colorado,
W74-00243 5C

PATENTS
Desalination Process,
W74-00081 3A

Sewage Treatment Method and Apparatus,
W74-00082 5D

Selective Destruction of Bacteria,
W74-00083 5F

Pollution Skimmer,
W74-00084 5G

Converging Vortex Apparatus for Separating oil from Water,
W74-00085 5G

Separating Apparatus,
W74-00086 5G

Apparatus for Removing Oil From Oil-Contaminated Water,
W74-00087 5G

Method for Controlling Algae Pollution,
W74-00088 5G

Oil Recovery Vessel,
W74-00089 5G

Floating Oil Containment Boom,
W74-00090 5G

Filter Media for Liquid Wastes Treatment and Method of Forming the Same,
W74-00091 5D

Electrical Power Plant Driven by Ocean Waves and Tides,
W74-00092 8C

PATH OF POLLUTANTS
Capacities of Shallow Waters of Sagami Bay for Oxidation and Reduction of Inorganic Nitrogen,
W74-00047 5B

Rate of Evaporation of Low-Solubility Contaminants from Water Bodies to Atmosphere,
W74-00071 5B

Ground-Water Nitrate Pollution in Rural Areas,
W74-00095 5B

Dispersion and Transport of Rhodamine B Dye and Methoxychlor in Running Water: A Preliminary Study,
W74-00279 5B

Hydrogeological Basis for Protection of Groundwater and Water Wells from Pollutants (Gidrogeologicheskoye obosnovaniye zashchity podzemnykh vod i vodozaborov ot zagryazneniy),
W74-00347 5B

Dispersion During Flow in Porous Media with Bilinear Adsorption,
W74-00367 5B

Picloram Movement from a Chaparral Watershed,
W74-00370 5B

Effect of Agricultural Management of Wet Sloping Soil on Nitrate and Phosphorus in Surface and Subsurface Water,
W74-00371 5B

Annual Cycle in River Water Quality: A Time Series Approach,
W74-00372 5B

Effect of Insoluble Grains on Leachate From Porous Beds,
W74-00379 5B

Movement of Pollutant Phosphorus in Saturated Soils,
W74-00392 5B

Bacterial Flagellar Uncoordination as a Monitor for Industrial Pollutants,
W74-00438 5B

AUNCH MANURE
Other Research Needs,
W74-00140 5G

EAT BOGS
Distribution of Peat Bogs on Earth, Their Types and Characteristics, (In Russian),
W74-00147 2H

EAT WATER
A System for Polyacrylamide Gel Electrophoresis of Humic Acids, (Ein System Zur Polyacrylamidgelelektrophorese Von Huminsauren),
W74-00260 5A

ENAEUS-ORIENTALIS
Ecological Studies on the Penaeus orientalis Kishinoue Cultured in a Pond Filled with Sea Water: I. Growth Rate as Related to the Substrate Materials, Survival Rate, Predator of P. Orientalis, and Water Conditions of Culturing Pond,
W74-00486 5C

ENNSYLVANIA
Pressure Sewer Demonstration at The Borough of Phoenixville, Pennsylvania,
W74-00153 5D

Skippack Watershed and the Evansburg Project: A Case Study for Water Resources Planning,
W74-00445 6B

ENTACHLOROPHENOL
Metabolic Effects of Technical Pentachlorophenol (PCP) on the Eel Anguilla anguilla L.,
W74-00482 5C

ERCHES
The Dynamics of a Group of Perches, Perca Flavescens (Mitchill) in the Grande-Anse Cove of Perrot Island in Saint-Louis Lake, (In French),
W74-00470 2H

ERCHLORINATION REACTIONS
Exhaustive Chlorination as a Technique in the Analysis of Aromatic Hydrocarbons,
W74-00080 5A

ERCOLATES
Nitrate Content of Percolates from Manured Lysimeters,
W74-00417 5B

ERFORMANCE
Methods for Improvement of Trickling Filter Plant Performance. Part I. Mechanical and Biological Optima,
W74-00431 5D

ERMAFROST
The Growth of Pingos, Western Arctic Coast, Canada,
W74-00098 2C

ERMEABILITY
New Membrane Compositions for Desalination of Water by Reverse Osmosis,
W74-00158 3A

Development of Improved Membranes for Reverse Osmosis,
W74-00159 3A

Hydrocasting Reverse Osmosis Membranes, Development of Porous Support Tubes, Study of Mechanism of Membrane Formation and Development of Non-Cellulosic Desalination Membranes,
W74-00161 3A

Transport Properties of Charge-Mosaic Membranes-Part A,
W74-00310 3A

Fabrication and Testing of Tubular Reverse Osmosis Modules Containing Ultrathin Membranes for Wet-Dry Cycling Operations,
W74-00313 5F

PERMSELECTIVE MEMBRANES
Membrane Processes (Osmosis and Reverse Osmosis),
W74-00145 3A

Improved Ethyl Cellulose Membranes for Reverse Osmosis Application,
W74-00157 3A

New Membrane Compositions for Desalination of Water by Reverse Osmosis,
W74-00158 3A

Transport Properties of Charge-Mosaic Membranes-Part A,
W74-00310 3A

New Polymer Membrane Technology for Desalination of Seawater by Reverse Osmosis,
W74-00312 3A

Research on Composite Hollow Tubules,
W74-00315 3A

Research on Composite Hollow Tubulets,
W74-00317 3A

PEST CONTROL
Parasites, Disease, and Disease Control of Great Lakes Anadromous and Commercial Fish,
W74-00229 5C

PESTICIDE KINETICS, DYE DISPERSION
Dispersion and Transport of Rhodamine B Dye and Methoxychlor in Running Water: A Preliminary Study,
W74-00279 5B

PESTICIDE RESIDUE
Two Studies of Pesticide Residues,
W74-00529 5C

PESTICIDE RESIDUES
A Simplified Clean-Up Technique for Organochlorine Residues at the Microliter Level,
W74-00058 5A

Organochlorine Insecticide Residues in Streams Draining Agricultural, Urban-Agricultural, and Resort Areas of Ontario, Canada - 1971,
W74-00070 5B

Thin-Layer Chromatography and Enzyme Inhibition Techniques. Introduction,
W74-00254 5A

Degradation of Parathion in Flooded Acid Soils,
W74-00268 5B

Organochlorine Residues in Estuarine Molluskes, 1965-72 - National Pesticide Monitoring Program,
W74-00291 5C

Biological Aspects of Agriculture's Effects on Environmental Quality,
W74-00396 5B

A Study of Pesticide Residue Levels and Insecticide Resistance in Selected Aquatic Organisms Occurring Around the Bryan-College Station Agricultural Production areas,
W74-00530 5C

A Survey of DDT Residues in Fish from the Brazos and Navasota Rivers and Somerville Reservoir,
W74-00531 5C

PESTICIDE TOXICITY
Photodecomposition of the Herbicide Methazole,
W74-00050 5B

PESTICIDES
Adsorption of Traces of Insecticides from Water on Polyethylene, (Adsorption von Spuren von Insecticiden aus Wasser an Polyathylen),
W74-00259 5A

PETROCHEMICALS
Petrochemical Analytical Problems. II. Gas-Liquid Chromatographic-Mass Spectrometric Investigation of Industrial Dodecylbenzenes,
W74-00250 5A

PETROLEUM DISTILLATES
Compositional Studies of a High-Boiling 370-535 C Distillate from Prudhoe Bay, Alaska, Crude Oil,
W74-00258 5A

PHENOLOGY
Relations Between Host Plants and Phenology of the Gall Midges Contarinia Tritici (Kirby) and Sitodiplosis Mosellana (Geh.), (In German),
W74-00388 3F

PHENOLS
The Chemistry and Quantitative Utility of Sodium Cobaltinitrite in the Determination of Phenols,
W74-00465 5A

PHOENIXVILLE (PENN)
Pressure Sewer Demonstration at The Borough of Phoenixville, Pennsylvania,
W74-00153 5D

PHOSPHATES
Effect of Agricultural Management of Wet Sloping Soil on Nitrate and Phosphorus in Surface and Subsurface Water,
W74-00371 5B

Movement of Pollutant Phosphorus in Saturated Soils,
W74-00392 5B

Determination of Orthophosphate,
W74-00464 5A

PHOSPHORUS
Inorganic and Organic Phosphorus Distribution in Domestic and Municipal Sewage,
W74-00055 5B

Pilot Plant Demonstration of Lime-Biological Treatment Phosphorus Removal Method,
W74-00155 5D

Water Chemistry of Ellicott Creek, Western New York,
W74-00166 5A

A Comparison of A Wet Pressure Digestion Method with Other Commonly Used Wet and Dry-Ashing Methods,
W74-00462 5A

PHOSPHOTHIOATE PESTICIDES
Degradation of Parathion in Flooded Acid Soils,
W74-00268 5B

PHOTOACTIVATION
Limiting Steps in Photosystem II and Water Decomposition in Chlorella and Spinach Chloroplasts,
W74-00238 5C

PHOTODECOMPOSITION
Photodecomposition of the Herbicide Methazole,
W74-00050 5B

PHOTODEGRADATION
Effects of pH, Light and Temperature on Carbaryl in Aqueous Media,
W74-00056 5B

Photolysis of the Herbicide Dinitramine (N3,N3-Diethyl-2,4-Dinitro-6-Trifluoromethyl-M-Phenylenediamine),
W74-00282 5B

PHOTOGRAMMETRY
Investigation of Ice Movement on Mountain Glaciers by Stereophotogrammetry (Issledovaniye dvizheniya l'da gornykh lednikov stereofotogrammetricheskim metodom),
W74-00346 2C

PHOTOLYSIS
Photolysis of the Herbicide Dinitramine (N3,N3-Diethyl-2,4-Dinitro-6-Trifluoromethyl-M-Phenylenediamine),
W74-00282 5B

PHOTOSYNTHESIS
Rates of Photosynthesis and Phytoplankton Growth in Shagawa Lake, Minnesota,
W74-00151 5C

The Effects of Carbon Dioxide Concentration on Oxygen Evolution and Fluorescence Transients in Synchronous Cultures of Chlorella pyrenoidosa,
W74-00239 5C

PHOTOSYNTHETIC OXYGEN
The Effects of Carbon Dioxide Concentration on Oxygen Evolution and Fluorescence Transients in Synchronous Cultures of Chlorella pyrenoidosa,
W74-00239 5C

PHYSICAL-CHEMICAL TREATMENT
Physical-Chemical Treatment of a Municipal Wastewater Using Powdered Carbon,
W74-00154 5D

PHYSICAL PROPERTIES
Characteristics of Animal Wastes and Runoff,
W74-00131 5G

Characteristics of Livestock Waste and Runoff,
W74-00138 5G

PHYTOCENOSIS
Water Content in a Phytocoenosis, and Water Budget of a Ecosystem; Oak-Forest of Virelles, (In French),
W74-00474 2I

PHYTOPLANKTON
Effect of River Discharge Regulation on the Lower Don Phytoplankton, (In Russian),
W74-00120 5C

Rates of Photosynthesis and Phytoplankton Growth in Shagawa Lake, Minnesota,
W74-00151 5C

Ecology and Production of the Profundal Benthos in Relation to Phytoplankton in Lake Esrom,
W74-00466 5C

PICEANCE CREEK BASIN (COLO)
Hydraulic Testing Accompanying Drilling of Five Exploratory Holes, Piceance Creek Basin, Colorado,
W74-00299 2F

PICLORAM
Picloram Movement from a Chaparral Watershed,
W74-00370 5B

PILOT PLANTS
Pilot-Demonstration Project for Industrial Reuse of Renovated Municipal Wastewater,
W74-00305 5D

Design Integrity and Performance Characteristics of Helical Tubular Module Elements in Reverse Osmosis Plants,
W74-00319 3A

Methods for Improvement of Trickling Filter Plant Performance. Part I. Mechanical and Biological Optima,
W74-00431 5D

PINGOS
The Growth of Pingos, Western Arctic Coast, Canada,
W74-00098 2C

PIPES
Design of Optimal Sewerage Systems,
W74-00183 5D

PLANKTON
Environmental Studies of Monterey Bay and the Central California Coastal Zone,
W74-00036 2L

Qualitative and Quantitative Variation of Net Plankton of Craighead Lake,
W74-00075 2H

PLANNING
Georgia's Water Problems and Related Research Needs,

POTABLE WATER

Nitrate Content of Well Water in West-Central Wisconsin,
W74-00246 5B

On the Problem of Emergency-Supply with Drinking-Water by Way of Seitz-Filter, (In German),
W74-00472 5F

The Effect of KCl in Drinking Water on Milk Secretion and Composition, (In Rumanian),
W74-00483 5C

POTASSIUM CHLORIDE

The Effect of KCl in Drinking Water on Milk Secretion and Composition, (In Rumanian),
W74-00483 5C

POTATOES

Manuring of Potatoes on Fen Silt Soils in Holland, Lincolnshire,
W74-00422 3F

POULTRY

Toxicity of Droppings From Coumaphos-Fed Hens to Little House Fly Larvae,
W74-00410 5C

Nitrate Content of Percolates from Manured Lysimeters,
W74-00417 5B

High-Temperature, High-Pressure Extrusion of Chicken Excreta,
W74-00418 5D

Electric In-House Drying of Poultry Waste,
W74-00426 5D

POULTRY LITTER

Utilization of Different Levels of Poultry Litter Nitrogen by Sheep,
W74-00401 5G

POWDERED CARBON

Physical-Chemical Treatment of a Municipal Wastewater Using Powdered Carbon,
W74-00154 5D

POWERPLANTS

Electrical Power Plant Driven by Ocean Waves and Tides,
W74-00092 8C

PRECIPITATION (ATMOSPHERIC)
Interaction of Bulk Precipitation, Stream Water, and Sewage in a Small Watershed Near Oxford, Mississippi,
W74-00005 2A

Estimating the Precipitation Climate,
W74-00375 2A

Tropical Cyclone Precipitation in New Jersey,
W74-00435 2B

PRECIPITATION GAGES
Results of an Operational Test of M-100 Radio-Electronic Snow Gages,
W74-00109 2C

PRESSURE
High-Temperature, High-Pressure Extrusion of Chicken Excreta,
W74-00418 5D

PRESSURE-ASSISTED LIQUID CHROMATOGRAPHY
The Use of Pressure-Assisted Liquid Chromatography in the Separation of Polynuclear Hydrocarbons,
W74-00256 5A

PRESSURE CONDUITS
Pressure Sewer Demonstration at The Borough of Phoenixville, Pennsylvania,
W74-00153 5D

PRESSURE MEASURING INSTRUMENTS
Characteristics of Wave Records in the Coastal Zone,
W74-00033 2H

PRESSURE SEWERS
Pressure Sewer Demonstration at The Borough of Phoenixville, Pennsylvania,
W74-00153 5D

PRICE DISTORTIONS
Energy Conservation Strategies,
W74-00152 6B

PRIMARY PRODUCTION
Estimation of Fish Production in the Volgograd Water Reservoir, (In Russian),
W74-00480 2H

Role of Ultranannoplankton Algae in Primary Production in Lake Baikal During the Summer, (In Russian),
W74-00488 2H

PRIMARY PRODUCTIVITY
Effects of Artificial Aeration on the Chemistry and Algae of Two Michigan Lakes,
W74-00048 5C

Nutrient Factors Limiting Primary Productivity in Simulated and Field Antarctic Microecosystems,
W74-00069 5C

PRODUCTIVITY
Environmental Studies of Monterey Bay and the Central California Coastal Zone,
W74-00036 2L

Zoobenthos Resources and Productivity in the Gulf of Taganrog, (In Russian),
W74-00495 5C

PROFESSIONAL SOCIETIES
The Role of Professional Societies in the Dissemination of Water Resources Research Information,
W74-00203 10A

PROFUNDAL ZONE
Ecology and Production of the Profundal Benthos in Relation to Phytoplankton in Lake Esrom,
W74-00466 5C

PROGRAM PLANNING REVIEW
Regional Administrator's Summary,
W74-00142 6B

PROJECT PLANNING
Assessing the Social Effects of Public Works Projects,
W74-00163 6B

Metropolitan Council Five-Year Capital Improvement Program for Sewerage Facilities.
W74-00450 5G

PROTECTION
The Development of Methods for the Planning of Utilisation and Protection of Yugoslav Water Resources.
W74-00170 6A

PROTEIN
Utilization of Different Levels of Poultry Litter Nitrogen by Sheep,
W74-00401 5G

PROTEIN INTAKE
Observations on the Effect of Protein Intake and Stage of Gestation on the Proportion of Urinary Nitrogen Excreted as Urea in Sheep,
W74-00408 5B

PROTEINS
Protein Adsorption by Suspended Sediments: Effects of pH, Temperature, and Concentration,
W74-00293 5B

PRUDHOE BAY (ALAS)
Compositional Studies of a High-Boiling 370-535 C Distillate from Prudhoe Bay, Alaska, Crude Oil,
W74-00258 5A

PUBLIC ACCESS
Water Development and Urban Recreation,
W74-00446 6B

PUBLIC HEALTH
Public Health Consequences of Mass Swarming of Boophthora Erthrocephala (De Geer, 1776) Black Flies in County Szolnok During Floods of 1970,
W74-00477 5G

PUBLIC PARTICIPATION
Case Description: Morrison Creek Stream Group Basin, California,
W74-00448 6F

PUBLIC UTILITIES
From Resort Area to Urban Recreation Center: Themes in the Development of Lake Tahoe 1946-1956,
W74-00441 6B

PUBLICATIONS
Research Findings and the Design Engineer,
W74-00201 10A

PUERTO RICO
Puerto Rico: A Case Study of Water Resource Technology Transfer,
W74-00197 10A

Effects of Underwater Demolition on the Environment in a Small Tropical Marine Cove,
W74-00233 5C

PUGET SOUND (WASH.)
Formation of Thermal Microstructure in a Narrow Embayment During Flushing,
W74-00517 2L

PUMICE STONES
Apparatus for Removing Oil From Oil-Contaminated Water,
W74-00087 5G

PUMP-GRINDERS
Pressure Sewer Demonstration at The Borough of Phoenixville, Pennsylvania,
W74-00153 5D

PUMPING PLANTS
Estimating Regional Wastewater Treatment Costs,
W74-00169 5D

PYROLYSIS
Costs for Large Scale Continuous Pyrolysis of Solid Wastes,
W74-00404 5D

Continuous Solid Waste Retort - Feasibility Study,
W74-00405 5D

QUANTITATIVE ANALYSIS
On the Quantitative Determination of Free Carbon Dioxide in Natural Waters, (Zur quantitativen Bestimmung der freien Kohlensaure in naturlichen Wassern),
W74-00263 2K

Extraction of Dispersed Oils from Water for Quantitative Analysis by Infrared Spectrophotometry,
W74-00267 5A

QUATERNARY PERIOD
Quaternary Glaciation in Transbaykalia (Chetvertichnoye oledeneniye Zabaykal'ya),
W74-00343 2C

QUERCUS-PETRAEA
Comparative Characteristics of Ecological Conditions in Annual Clearing and Under a Canopy in Dry Cotinus Oak Woods, (In Russian),
W74-00487 2I

RADIATION
Use of the Gamma Field of the Earth to Determine the Water Content of Soils,
W74-00108 2G

RADIOACTIVITY EFFECTS
Tritium Production.
W74-00009 5B

Kinetics of Tritium in Biological Systems.
W74-00011 5B

RADIOACTIVITY TECHNIQUES
Capacities of Shallow Waters of Sagami Bay for Oxidation and Reduction of Inorganic Nitrogen,
W74-00047 5B

Separation of Water From Biological and Environmental Samples for Tritium Analysis,
W74-00053 5A

RADIOISOTOPES
Kinetics of Tritium in Biological Systems.
W74-00011 5B

Cesium 137 in a Mountain Stream Channel,
W74-00376 5B

RAINFALL-RUNOFF RELATIONSHIPS
Methodology for Assessing the Potential Impact of Urban Development on Urban Runoff and the Relative Efficiency of Runoff Control Alternatives,
W74-00001 2A

Loss of Particulate Organic Materials from Semiarid Watersheds as a Result of Extreme Hydrologic Events,
W74-00378 2A

RAINFALL SHELTERS
An Electronic Sensor and Circuit for Automatic Operation of Rainfall Shelters,
W74-00042 7B

RAMAN SPECTROSCOPY
Detection of Salts of 2,4-D In Aqueous Solution by Laster Raman Spectroscopy,
W74-00297 5A

RARE EARTH ELEMENTS
Determination of Some Rare-Earth Elements by Plasma-Jet Emission Spectrometry,
W74-00044 2K

A Study of the Variation with pH of the Solubility and Stability of Some Metal Ions at Low Concentrations in Aqueous Solution. Part II,
W74-00261 5A

RATION
The Effect of Ration on Engineering Properties of Beef Cattle Manure,
W74-00420 5B

REAERATION
Sewage Treatment Method and Apparatus,
W74-00082 5D

RECLAIMED WATER
Pilot-Demonstration Project for Industrial Reuse of Renovated Municipal Wastewater,
W74-00305 5D

RECREATION
From Resort Area to Urban Recreation Center: Themes in the Development of Lake Tahoe 1946-1956,
W74-00441 6B

Water Development and Urban Recreation,
W74-00446 6B

RECREATION FACILITIES
Reservoir Operation for Recreation Usability,
W74-00185 4A

RECYCLING
Engineering Alternatives in Natural Resources Development in Urban Regions,
W74-00122 5D

National Livestock Waste Management Program,
W74-00126 5G

Application, Utilization and Disposal of Livestock Wastes,
W74-00136 5G

Other Research Needs,
W74-00140 5G

A Promising Approach to Solving a Stream Pollution Problem,
W74-00164 5D

Glue Treatment-Pick a Way,
W74-00165 5D

Definition of Reverse Osmosis Requirements for Spacecraft Wash Water Recycling,
W74-00320 5D

Utilization of Different Levels of Poultry Litter Nitrogen by Sheep,

SALMON
Methylmercury as Percentage of Total Mercury in Flesh and Viscera of Salmon and Sea Trout of Various Ages,
W74-00079 5C

Mill Creek Fish Passage Facility,
W74-00351 8I

SALMONIDS
Lake Huron: Effects of Exploitation, Introductions, and Eutrophication on the Salmoid Community,
W74-00244 5C

SALT BALANCE
Water-Salt Balance of Groundwater in the Golodnaya Steppe in 1969 (Vodno-solevoy balans podzemnykh vod Golodnoy stepi za 1969 god),
W74-00340 4B

SALT CONTINUITY
The Equations of Mass Continuity and Salt Continuity in Estuaries,
W74-00510 2L

SALT LAKE CITY (UTAH)
Physical-Chemical Treatment of a Municipal Wastewater Using Powdered Carbon,
W74-00154 5D

SALTS
Salting-Out of Acetone from Water -Basis of a New Solvent Extraction System,
W74-00290 2K

SAMPLE PREPARATION
Gas Chromatographic Procedure to Analyze Amino Acids in Lake Waters,
W74-00061 5A

A Comparison of A Wet Pressure Digestion Method with Other Commonly Used Wet and Dry-Ashing Methods,
W74-00462 5A

Determination of Orthophosphate,
W74-00464 5A

SAMPLING
Sampling the Edible Muscle of the Swordfish (Xiphias gladius) for Total Mercury Analysis,
W74-00052 5A

SAN ANTONIO RIVER BASIN (TEX)
Reliability of Urban Water Quality Management,
W74-00180 5G

SAN ANTONIO (TEX)
Regional Specific Yield of the Edwards and Associated Limestones in the San Antonio, Texas Area,
W74-00542 2F

SAN FRANCISCO BAY
Classification System for Estuaries,
W74-00511 2L

SAN JOAQUIN VALLEY (CALIF)
Drain Installation for Nitrate Reduction,
W74-00398 5G

SAN LUIS VALLEY (COLO)
Water in the San Luis Valley, South-Central Colorado,
W74-00331 2A

SAND SPITS
Coastal Processes Around the Otago Peninsula,
W74-00521 2J

SAND TRANSPORT
Quarternary Beaches and Coasts Between the Russian River and Drakes Bay, California,
W74-00019 2J

SAND WAVES
Dynamics of Swash and Implication to Beach Response,
W74-00032 2J

SANDS
Sand Movement in Relation to Beach Topography,
W74-00020 2J

Whistling Sand Beaches in the British Isles,
W74-00104 2J

Selective Transport of Heavy Minerals by Shoaling Waves,
W74-00107 2J

SANDY SOIL
The Influence of Manure Amelioration Treatments on Physical Properties of Sandy Soil, (In Polish),
W74-00484 3F

SANITARY PROTECTIONS
Hygienic Efficacy of Sanitary Protection Measures for Surface Waters in the Region of Oil-Refining and Oil-Chemical Enterprises, (In Russian),
W74-00241 5B

SATELLITES (ARTIFICIAL)
Sea-Surface Circulation, Sediment Transport, and Marine Mammal Distribution, Alaska Continental Shelf,
W74-00298 2J

Application of Ecological, Geological and Oceanographic ERTS-1 Imagery to Delaware's Coastal Resources Planning,
W74-00540 7B

SATURATED SOILS
Movement of Pollutant Phosphorus in Saturated Soils,
W74-00392 5B

SCHEDULING
Scheduling and Sequencing in Water Resource Investment Models,
W74-00172 6A

SCHLUMBERGER ARRAY
Electrical Resistivity Soundings on the Coastal Plain of Southeastern Virginia: A Feasibility Study,
W74-00437 2F

SCIENTIFIC PERSONNEL
Georgia's Water Problems and Related Research Needs,
W74-00004 6B

SCINTILLATION COUNTING
Separation of Water From Biological and Environmental Samples for Tritium Analysis,
W74-00053 5A

SCOOPS
Oil Recovery Vessel,
W74-00089 5G

SCREENING MODELS
Joint Use of Screening and Simulation Models in Multiobjective Plan Formulation,
W74-00177 6B

SEA ICE
Effect of Salinity on the Optical Extinction of Sea Ice at 6328A,
W74-00333 2C

SEA TROUT
Methylmercury as Percentage of Total Mercury in Flesh and Viscera of Salmon and Sea Trout of Various Ages,
W74-00079 5C

SEA WATER
Certain Environmental Aspects of Tritium.
W74-00012 5B

A New Set of Acidity Constants for Carbonic Acid and Boric Acid in Sea Water,
W74-00046 5A

Capacities of Shallow Waters of Sagami Bay for Oxidation and Reduction of Inorganic Nitrogen,
W74-00047 5B

Detection of Trace Amounts of Oil in Sea Water by Fluorescence Spectroscopy,
W74-00059 5A

Baseline Concentrations of Light Hydrocarbons in Gulf of Mexico,
W74-00073 5B

A Model for Chemical Exchange in the Basalt-Seawater System of Oceanic Layer II,
W74-00097 2K

Effect of Compaction on Chemistry of Solutions Expelled from Montomorillonite Clay Saturated in Sea Water,
W74-00102 2J

Direct Determination of Bismuth and Antimony in Sea Water by Anodic Stripping Voltammetry,
W74-00275 2K

Analysis of Explosives in Sea Water and in Ocean Floor Sediment and Fauna,
W74-00285 5A

SEASONAL
Ecological and Floristic Convergences Between Seasonal Plant Formations of Tropical and Subtropical South America,
W74-00066 2I

Seasonal Variations in Selected Physicochemical Conditions of a Small Lake in Brazos County, Texas,
W74-00074 2H

SECONDARY PRODUCTIVITY
Ecology and Production of the Profundal Benthos in Relation to Phytoplankton in Lake Esrom,
W74-00466 5C

SECTION FOUR LAKE (MICH)
Effects of Artificial Aeration on the Chemistry and Algae of Two Michigan Lakes,
W74-00048 5C

SEDIMENT DISTRIBUTION
An Experimental Study of Heavy-Mineral Secregation Under Alluvial-Flow Conditions,
W74-00533 2J

SEDIMENT SORTING
Whistling Sand Beaches in the British Isles,
W74-00104 2J

SEDIMENT TRANSPORT
A Time Series from the Beach Environment,
W74-00017 2J

Quarternary Beaches and Coasts Between the Russian River and Drakes Bay, California,
W74-00019 2J

Sand Movement in Relation to Beach Topography,
W74-00020 2J

Tidal Currents and Zig-Zag Sand Shoals in a Wide Estuary Entrance,
W74-00021 2L

Equilibrium Characteristics of Sand Beaches,
W74-00027 2J

Dynamics of Swash and Implication to Beach Response,
W74-00032 2J

Coastal Processes and Long Range Planning,
W74-00034 2L

Environmental Studies of Monterey Bay and the Central California Coastal Zone,
W74-00036 2L

Selective Transport of Heavy Minerals by Shoaling Waves,
W74-00107 2J

Sea-Surface Circulation, Sediment Transport, and Marine Mammal Distribution, Alaska Continental Shelf,
W74-00298 2J

Patterns of Sediment Transport at Nearshore Zones Influenced by Wave and Tidal Currents: A Study Utilizing Fluorescent Tracers,
W74-00301 2L

Hydrology and Sediment Transport, Moanalua Valley, Oahu, Hawaii,
W74-00354 2E

Mechanism of Sand Movement on Coastal Dunes,
W74-00509 2J

Natural Indicators of Estuarine Sediment Movement,
W74-00512 2L

Studies on the Currents in the Littoral Zone of the Waltair Beach,
W74-00519 2J

Coastal Processes Around the Otago Peninsula,
W74-00521 2J

An Experimental Study of Heavy-Mineral Secregation Under Alluvial-Flow Conditions,
W74-00533 2J

SEDIMENTATION
Quarternary Beaches and Coasts Between the Russian River and Drakes Bay, California,
W74-00019 2J

Reorientation of Convex Shores,
W74-00028 2J

Effects of the Alaska Earthquake and Tsunami on Recent Deltaic Sediments,
W74-00524 2J

Tidal Variation of the Size Distribution of Suspended Sediment at a Station in the Chesapeake Bay Turbidity,
W74-00525 2L

An Experimental Study of Heavy-Mineral Secregation Under Alluvial-Flow Conditions,
W74-00533 2J

SEDIMENTS
Isomerization of Gamma-BHC to ALPHA-BHC in the Environment,
W74-00264 5B

Association of Hydrocarbons and Mineral Particles in Saline Solution,
W74-00265 5B

Analysis of Explosives in Sea Water and in Ocean Floor Sediment and Fauna,
W74-00285 5A

Protein Adsorption by Suspended Sediments: Effects of pH, Temperature, and Concentration,
W74-00293 5B

Stability Criteria for Bound-Rock Erosion Protection,
W74-00390 4D

SEEPAGE
Lake Okeechobee Seepage Monitoring Network,

Observations on the Effect of Protein Intake and Stage of Gestation on the Proportion of Urinary Nitrogen Excreted as Urea in Sheep,
W74-00408 5B

Dehydrated Poultry Manure as a Crude Protein Supplement for Sheep,
W74-00413 5G

SHOALING WATER
Theoretical and Experimental Study of Wave Enhancement and Runup on Uniformly Sloping Impermeable Beaches,
W74-00022 2H

SHORE PROTECTION
Quarternary Beaches and Coasts Between the Russian River and Drakes Bay, California,
W74-00019 2J

Theoretical and Experimental Study of Wave Enhancement and Runup on Uniformly Sloping Impermeable Beaches,
W74-00022 2H

Coastal Processes and Long Range Planning,
W74-00034 2L

Wisconsin's Shoreland Protection Program: A State-Local Regulatory Approach to Natural Resource Preservation,
W74-00447 6E

SHORELAND PROTECTION
Wisconsin's Shoreland Protection Program: A State-Local Regulatory Approach to Natural Resource Preservation,
W74-00447 6E

SHORELINE
Water Development and Urban Recreation,
W74-00446 6B

SHORELINE CONFIGURATION
Coastal Currents of the Western Gulf of Maine,
W74-00015 2H

Probabilities of Wave Characteristics in the Surf Zone,
W74-00018 2H

SHORES
Reorientation of Convex Shores,
W74-00028 2J

Wisconsin's Shoreland Protection Program: A State-Local Regulatory Approach to Natural Resource Preservation,
W74-00447 6E

Water Waves at the Shoreline,
W74-00526 2E

SHRIMP
Synopsis on the Biology of the Shrimp of Rio Del Northe (Chile), (In Spanish),
W74-00471 2I

SIEVE ANALYSIS
Settling Behaviour Related to Sieve Analysis of Skeletal Sands,
W74-00105 2J

SILICA
The Amino Acid and Sugar Composition of Diatom Cell-Walls,
W74-00240 5C

SILICIFICATION
The Amino Acid and Sugar Composition of Diatom Cell-Walls,
W74-00240 5C

SIMULATION ANALYSIS
Mathematical Modelling of Capacity Expansion of an Integrated Hydro-Thermal Electrical Power System,
W74-00175 6A

Joint Use of Screening and Simulation Models in Multiobjective Plan Formulation,
W74-00177 6B

Expected Optimum Record Length as a Basis for Hydrologic Network Design,
W74-00178 7C

Method for Numerical Simulation of Flow in Multiaquifer Systems,
W74-00382 2F

SITODIPLOSIS-MOSELLANA
Relations Between Host Plants and Phenology of the Gall Midges Contarinia Tritici (Kirby) and Sitodiplosis Mosellana (Geh.), (In German),
W74-00388 3F

SKELETAL SANDS
Settling Behaviour Related to Sieve Analysis of Skeletal Sands,
W74-00105 2J

SKIMMING
Pollution Skimmer,
W74-00084 5G

Converging Vortex Apparatus for Separating oil from Water,
W74-00085 5G

SLOPES
Runoff Formation on Mountain Slopes Under Carpathian Beech and Spruce Forests,
W74-00338 4A

SLUDGE TREATMENT
Sewage Treatment Method and Apparatus,
W74-00082 5D

Filtrability of Water-Treatment-Plant Sludge,
W74-00387 5F

SMALL WATERSHEDS
Interaction of Bulk Precipitation, Stream Water, and Sewage in a Small Watershed Near Oxford, Mississippi,
W74-00005 2A

Spring Runoff From Small Catchments with Different Forest Cover in the Mountains of Georgia,
W74-00339 4A

Nutrient Losses After Clear-Cut Logging and Slash Burning in the Oregon Coast Range,
W74-00381 4C

Watershed Program Lacks Ecological Dimensions,
W74-00442 6G

SNOW
Results of an Operational Test of M-100 Radio-Electronic Snow Gages,
W74-00109 2C

Short-Term Snow Loads,
W74-00111 2C

SNOW CONTAMINATION
Polluted Snow in Southern Norway and the Effect of the Meltwater on Freshwater and Aquatic Organisms,
W74-00287 5C

Mercury: Environmental Considerations, Part I,
W74-00292 5C

SNOW COVER
Short-Term Snow Loads,
W74-00111 2C

Description of Snow Transport and Snow Deposition in the European USSR,
W74-00112 2C

SNOW SURVEYS
Results of an Operational Test of M-100 Radio-Electronic Snow Gages,
W74-00109 2C

Description of Snow Transport and Snow Deposition in the European USSR,
W74-00112 2C

SNOW TRANSPORT
Description of Snow Transport and Snow Deposition in the European USSR,
W74-00112 2C

SNOWMELT
Determination of Liquid Runoff from the Firn Field of a Glacier,
W74-00115 2C

Alternative Methods of Estimating Snow Water Parameters,
W74-00377 2C

SNOWPACKS
Effect of an Error in the Determination of the Maximum Water Equivalent of Snow in a Basin on the Forecast Accuracy of the Spring Flood Volume,
W74-00110 2C

Short-Term Snow Loads,
W74-00111 2C

SOCIAL IMPACT
Assessing the Social Effects of Public Works Projects,
W74-00163 6B

SOCIAL PARTICIPATION
Assessing the Social Effects of Public Works Projects,
W74-00163 6B

SODIUM COBALTINITRITE
The Chemistry and Quantitative Utility of Sodium Cobaltinitrite in the Determination of Phenols,
W74-00465 5A

SOIL COLUMNS
Movement of Pollutant Phosphorus in Saturated Soils,
W74-00392 5B

SOIL CONDITIONERS
Effects of Some Soil Conditions on Sugar Beet Seedling Emergence,
W74-00389 3F

SOIL CONTAMINATION
Regional Perspectives,
W74-00123 5G

Pollution of Air, Water, and Soil by Livestock,
W74-00128 5G

Pollution of Air, Water and Soil by Livestock,
W74-00135 5G

Mercury: Environmental Considerations, Part I,
W74-00292 5C

Biological Aspects of Agriculture's Effects on Environmental Quality,
W74-00396 5B

Engineering Agricultural Wastes,
W74-00397 5D

Soil Conditions Under Feedlots and on Land Treated with Large Amounts of Animal Wastes,
W74-00399 5B

Human and Animal Wastes as Fertilizers,
W74-00419 5D

Effects of Swine Lagoon Effluent on the Soil and Plant Tissue,
W74-00428 5D

SOIL DENITRIFICATION
Soil Denitrification in Sealed Soil-Plant Systems: II. Effect of Soil Water Content and Form of Applied Nitrogen,
W74-00014 2G

SOIL DENITRIFICATION

Soil Dentrification in Sealed Soil-Plant Systems: III. Effect of Disturbed and Undisturbed Soil Samples,
W74-00025 2G

Soil Denitrification in Sealed Soil-Plant Systems: I. Effect of Plants, Soil Water Content and Soil Organic Matter Content,
W74-00237 2G

SOIL DROUGHT

Effect of Soil Drought on Water Availability and Plant Growth, (In Russian),
W74-00475 3F

SOIL FORMATION

Calcium Carbonate Cementation of Alluvial Fans in Southern Nevada,
W74-00349 2K

SOIL METERS

Modification of the Way of Reading the Values of Resistance Measured by Means of the Pneumatic Soil Resistancemeter (Penetrometer Type), (In Polish),
W74-00051 7B

SOIL MICROORGANISMS

Nitrate and Nitrite Volatilization by Microorganisms in Laboratory Experiments,
W74-00008 5G

SOIL PROPERTIES

Infiltration Properties of Soils and Intrazonal Structure of the Hydrologic Budget (Infil'tratsionnyye svoystva pochv i vnutrizonal'nyye osobennosti struktury vodnogo balansa),
W74-00341 2G

SOIL TREATMENT

The Influence of Manure Amelioration Treatments on Physical Properties of Sandy Soil, (In Polish),
W74-00484 3F

SOIL WATER

Use of the Gamma Field of the Earth to Determine the Water Content of Soils,
W74-00108 2G

SOIL WATER MOVEMENT

Some Aspects of the Hydrodynamic Dispersion of Solutes in Porous Materials,
W74-00360 2G

Analysis of Coupled Heat-Fluid Transport in Partially Frozen Soil,
W74-00369 2G

SOIL-WATER-PLANT RELATIONSHIPS

Soil Denitrification in Sealed Soil-Plant Systems: II. Effect of Soil Water Content and Form of Applied Nitrogen,
W74-00014 2G

Soil Dentrification in Sealed Soil-Plant Systems: III. Effect of Disturbed and Undisturbed Soil Samples,
W74-00025 2G

Soil Denitrification in Sealed Soil-Plant Systems: I. Effect of Plants, Soil Water Content and Soil Organic Matter Content,
W74-00237 2G

SOILS

Certain Environmental Aspects of Tritium.
W74-00012 5B

Relationship Between Properties and Agricultural Suitability of Soils: Soil Complexes: Good Wheat Soils, Very Good Rye Soils, Good Rye Soils (In Polish),
W74-00054 2G

SOILS (GREY FERRUGINOUS)

Contribution to the Knowledge of Mineral Nitrogen Dynamics in a Grey Ferruginous Soil at Nioro-Du-Rip (Senegal), (In French),
W74-00062 3F

SOILS (LIMAN-MEADOW)

Dynamics of Trace Elements in Liman-Meadow Soils of the Arid Zone of Central Kazakhstan, (In Russian),
W74-00479 5B

SOLID WASTES

Cost-Effectiveness Analysis of Disposal Systems,
W74-00184 5E

Costs for Large Scale Continuous Pyrolysis of Solid Wastes,
W74-00404 5D

Continuous Solid Waste Retort - Feasibility Study,
W74-00405 5D

Solid Waste Management.
W74-00449 5G

SOLVENT EXTRACTION SYSTEMS

Salting-Out of Acetone from Water -Basis of a New Solvent Extraction System,
W74-00290 2K

SOLVENT EXTRACTIONS

The p-Value Approach to Quantitative Liquid-Liquid Extraction of Pesticides and Herbicides from Water. 3. Liquid-Liquid Extraction of Phenoxy Acid Herbicides from Water,
W74-00262 5A

Extraction of Dispersed Oils from Water for Quantitative Analysis by Infrared Spectrophotometry,
W74-00267 5A

The Solvent Extraction of the Ternary Complexes of Iron (II)-Rhodamine B With Various Nitrosophenols. Determination of Iron in Waters,
W74-00288 2K

SOLVENTS

A Fundamental Comparison of the Utility of Trichloroethylene and Perchloroethylene in the Application of Disperse Dyes to Polyester,
W74-00433 3E

SOUNDING

In Situ Measurement of Sediment Sound Speed During Coring,
W74-00294 2J

SOUTH AMERICA

Ecological and Floristic Convergences Between Seasonal Plant Formations of Tropical and Subtropical South America,
W74-00066 2I

SOUTH ATLANTIC SLOPE BASINS

Quality of Surface Waters of the United States, 1968: Part 2. South Atlantic Slope and Eastern Gulf of Mexico Basins.
W74-00303 2K

SOUTH CAROLINA

A Systematic Survey of Intertidal Oysters in the Savannah River Basin Area of South Carolina,
W74-00300 5C

SOUTH DAKOTA

Demolition of Ft. Meade Dam, Sturgis, South Dakota, June 1972,
W74-00322 8H

SOUTHEAST U.S.

Quality of Surface Waters of the United States, 1968: Part 2. South Atlantic Slope and Eastern Gulf of Mexico Basins.
W74-00303 2K

SOUTHERN HIGH PLAINS (TEX AND N MEX)

Artificial-Recharge Experiments and Operations on the Southern High Plains of Texas and New Mexico,
W74-00325 4B

SOUTHWEST U.S.

State Water Resource Planning in Arid Arizona,
W74-00181 6B

SPATIAL DISTRIBUTION

Biological and Chemical Features of Tidal Estuaries,
W74-00031 2L

SPAWNING

Frazer Lake Sockeye Investigations, 1970,
W74-00232 8I

SPECIFIC YIELD

Regional Specific Yield of the Edwards and Associated Limestones in the San Antonio, Texas Area,
W74-00542 2F

SPECTROMETERS

Influence of Heating Rate on Analytical Response in Flameless Atomic Absorption Spectrometry,
W74-00278 5A

SPECTROPHOTOMETRY

Determination of Some Rare-Earth Elements by Plasma-Jet Emission Spectrometry,
W74-00044 2K

Cadmium Concentrations in Some Fish Species from A Coastal Area in Southern Norway,
W74-00257 5A

Improved Apparatus for Determination of Mercury by Flameless Atomic Absorption,
W74-00276 5A

Determination and Differentiation of Ethylenediaminetetra-Acetic Acid (EDTA) and Nitrilotriacetic Acid (NTA) in Freshwater,
W74-00295 5A

SPECTROSCOPY

Detection of Salts of 2,4-D In Aqueous Solution by Laster Raman Spectroscopy,
W74-00297 5A

SPHAGNUM

Distribution of Peat Bogs on Earth, Their Types and Characteristics, (In Russian),
W74-00147 2H

SPIRILLUM VOLUTANS

Bacterial Flagellar Uncoordination as a Monitor for Industrial Pollutants,
W74-00438 5B

SPRINGS
Processing of Results of Observations of Spring Discharge,
W74-00096 2E

The Dushanbe Artesian Basin and Its Mineral and Thermal Waters (Dushanbinskiy artezianskiy basseyn i yego mineral'nyye i termal'nyye vody),
W74-00117 4B

SPRINKLING
Sprinkling Cattle for Relief from Heat Stress,
W74-00421 3F

SPRUCE TREES
Runoff Formation on Mountain Slopes Under Carpathian Beech and Spruce Forests,
W74-00338 4A

SRI LANKA (CEYLON)
Obstacles to Consideration of Resources Management Alternatives: South Asian Experience,
W74-00208 10A

ST. LAWRENCE RIVER
A Numerical Model of the St. Lawrence River,
W74-00385 2L

ST. PAUL (MINN.)
Solid Waste Management.
W74-00449 5G

Metropolitan Council Five-Year Capital Improvement Program for Sewerage Facilities.
W74-00450 5G

Metropolitan Development Guide, Water Resources Policy Plan, Program.
W74-00451 6B

Sewage and Waste Control Rules and Regulations for the Metropolitan Disposal System.
W74-00452 5G

STAPHYLOCOCCI
Staphylococci and Micrococci In Swimming-Bath Water, (In German),
W74-00277 5A

STATE GOVERNMENTS
Regional Administrator's Summary,
W74-00141 5G

STATISTICAL METHODS
Processing of Results of Observations of Spring Discharge,
W74-00096 2E

Alternative Methods of Estimating Snow Water Parameters,
W74-00377 2C

STATISTICAL MODELS
Methodology for Assessing the Potential Impact of Urban Development on Urban Runoff and the Relative Efficiency of Runoff Control Alternatives,
W74-00001 2A

STEREOPHOTOGRAMMETRY
Investigation of Ice Movement on Mountain Glaciers by Stereophotogrammetry (Issledovaniye dvizheniya l'da gornykh lednikov stereofotogrammetricheskim metodom),
W74-00346 2C

STORM RUNOFF
Methodology for Assessing the Potential Impact of Urban Development on Urban Runoff and the Relative Efficiency of Runoff Control Alternatives,
W74-00001 2A

STORMS
Some Aspects of Wave Action on a Gently Sloping Sandy Beach,
W74-00527 2E

STORN RUNOFF
Toxic Materials Analysis of Street Surface Contaminants,
W74-00306 5B

STRAITS
Gravitational Circulation in Straits and Estuaries,
W74-00029 2L

STRATIFICATION
A Test of Mixing Length Theories in a Coastal Plain Estuary,
W74-00528 2L

STREAM LENGTHS
A Stream Length Study,
W74-00380 2E

STREAMFLOW
Interaction of Bulk Precipitation, Stream Water, and Sewage in a Small Watershed Near Oxford, Mississippi,
W74-00005 2A

Stream Gauging Information, Australia--Supplement 1971.
W74-00350 7C

Hydrology and Sediment Transport, Moanalua Valley, Oahu, Hawaii,
W74-00354 2E

A Reconnaissance of the Water Resources in the Pahsimeroi River Basin, Idaho,
W74-00356 2E

Annual Cycle in River Water Quality: A Time Series Approach,
W74-00372 5B

Reconnaissance of the Water Resources of Beaver County, Oklahoma,
W74-00534 7C

STREAMS
A Stream Length Study,
W74-00380 2E

STREET-SURFACE CONTAMINANTS
Toxic Materials Analysis of Street Surface Contaminants,
W74-00306 5B

SUBMARINE CANYONS
Congo Submarine Canyon and Fan Valley,
W74-00093 2J

Continuity of Turbidity Current Flow and Systematic Variations in Deep-Sea Channel Morphology,
W74-00348 2J

SUBSIDENCE
Steady State Ground Motions Caused by Single-Well Pumping,
W74-00361 4B

SUGAR BEETS
Effects of Some Soil Conditions on Sugar Beet Seedling Emergence,
W74-00389 3F

SULFONATED POLYPHENYLENE OXIDE MEMBRANES
Research on Reverse Osmosis Membranes for Purification of Wash Water at Sterilization (165 deg F),
W74-00316 5D

SULFUR
Sulphur Pollution Patterns Observed: Leaching of Calcium in Forest Soil Determined,
W74-00476 5B

SURF
Selective Transport of Heavy Minerals by Shoaling Waves,
W74-00107 2J

SURF ZONE
Probabilities of Wave Characteristics in the Surf Zone,
W74-00018 2H

SURFACE DRAINAGE
Metropolitan Development Guide, Water Resources Policy Plan, Program.
W74-00451 6B

SURFACE RUNOFF
Toxic Materials Analysis of Street Surface Contaminants,
W74-00306 5B

SURFACE TENSION
Hydrocasting Reverse Osmosis Membranes, Development of Porous Support Tubes, Study of Mechanism of Membrane Formation and Development of Non-Cellulosic Desalination Membranes,
W74-00161 3A

SURFACE WATERS
Quality of Surface Waters of the United States, 1968: Part 2. South Atlantic Slope and Eastern Gulf of Mexico Basins.
W74-00303 2K

Salinity Studies in East Glades Agricultural Area, Southeastern Dada County, Florida,
W74-00329 3C

Water in the San Luis Valley, South-Central Colorado,
W74-00331 2A

Water Resources Summary, Island of Hawaii,
W74-00355 2E

SURFACE WAVES
Characteristics of Wave Records in the Coastal Zone,
W74-00033 2H

SURFACES
Reactions and Transport Phenomena, at Surfaces,
W74-00162 3A

SURFACTANTS
Biodegradability of Nonionic Surfactants: Screening Test for Predicting Rate and Ultimate Biodegradation,
W74-00269 5B

SURGES
Evidence of a Surge on Barnes Ice Cap, Baffin Island,
W74-00537 2C

SURVEYS
Water Temperature Surveys in the Vicinity of Power Stations with Special Reference to Infra-Red Techniques,
W74-00076 5A

SUSPENDED SOLIDS
Protein Adsorption by Suspended Sediments: Effects of pH, Temperature, and Concentration,
W74-00293 5B

SWEDEN
Studies in Sweden on Feasibility of Some Methods for Restoration of Mercury-Contaminated Bodies of Water,
W74-00060 5G

SWIMMING BATHS
Staphylococci and Micrococci In Swimming-Bath Water, (In German),
W74-00277 5A

SWINE
Excretion Studies in Swine Fed Arsanilic Acid,
W74-00400 5B

A Recycled Feed Source From Aerobically Processed Swine Wastes,
W74-00412 5D

SWORDFISH
Sampling the Edible Muscle of the Swordfish (Xiphias gladius) for Total Mercury Analysis,
W74-00052 5A

SYNTHESIS
Sigma-Inductive Model vs. Field Model. Observation of a Reversed Attenuation Effect,
W74-00323 2K

SYSTEMS ANALYSIS
Need for Metropolitan Water Balance Inventories,
W74-00187 6A

Development of Mathematical Modeling Capabilities for the Vistula River Project, Poland,
W74-00218 10A

TADZHIKISTAN (USSR)
The Dushanbe Artesian Basin and Its Mineral and Thermal Waters (Dushanbinskiy artezianskiy basseyn i yego mineral'nyye i termal'nyye vody),
W74-00117 4B

TANZANIA
Survey of Potential Vectors of Yellow Fever in Tanzania, (In French),
W74-00242 5G

TASMANIA (MACQUARIE HARBOUR)
Water-Level Fluctuations and Flow in Tidal Inlets,
W74-00507 2L

TASTE
Taste Thresholds of Halogens in Water,
W74-00119 5F

TECHNICAL SOCIETIES
The Role of Professional Societies in the Dissemination of Water Resources Research Information,
W74-00203 10A

TECHNOLOGY TRANSFER
Transfer of Water Resources Knowledge.
W74-00189 10A

Economic Analysis and Municipal Water Supply in Developing Countries,
W74-00190 10A

Research Implementation, A Coordinated Approach,
W74-00191 10A

Water Resources Scientific and Technical Information Display, Storage, and Retrieval,
W74-00192 10A

The Information Science Approach to Transfer of Knowledge,
W74-00193 10A

Transmitting Water Resources Information By a Time-Share System,
W74-00194 10A

Developing a Cooperative Research Program For Flood Control in Brahmaputra Valley,
W74-00195 10A

Application of Hydrogeological Data to Long-Term Economics of Growing Sugar Cane in Venezuela,
W74-00196 10A

Puerto Rico: A Case Study of Water Resource Technology Transfer,
W74-00197 10A

Transfer of Knowledge in Water Resources From Research to Practice,
W74-00198 10A

The Role of the International Commission on Irrigation and Drainage in the Transfer of Water Resources Knowledge,
W74-00199 10A

How Engineering Research is Reduced to Practice in the Bureau of Reclamation,
W74-00200 10A

Research Findings and the Design Engineer,
W74-00201 10A

Technical Aid for Hydrologic Studies in Spanish-Speaking Countries,
W74-00202 10A

The Role of Professional Societies in the Dissemination of Water Resources Research Information,
W74-00203 10A

The Water Resources Information Program at the University of Wisconsin,
W74-00204 10A

Eutrophication Research Applied to Water Quality Management on the Great Lakes,
W74-00205 10A

Water Resources Development Policies and Transfer of Knowledge from Developed to Developing Countries,
W74-00206 10A

Water Resources Utilization in Developing Countries,
W74-00207 10A

Obstacles to Consideration of Resources Management Alternatives: South Asian Experience,
W74-00208 10A

Transfer of Water Resources Knowledge from Developed to Developing Regions of the World,
W74-00209 10A

Knowledge Transfer,
W74-00210 10A

A Case on Transfer of Knowledge in Water Resources Systems Planning from a Developed Region to a Developing One, and from Research to Application,
W74-00211 10A

Research and Education for Development,
W74-00212 10A

Venezuelan Experience on the Transfer of Knowledge in Water Resources Engineering,
W74-00213 10A

Achievements of India in the Field of Water Resources Development,
W74-00214 10A

Experience of the U.S. Geological Survey in Transfer of Hydrologic Knowledge to the Developing Countries,
W74-00215 10A

Some Problems Associated with the Use of Foreign Advisors in Developing Countries,
W74-00216 10A

Transfer of Knowledge in Water Resources from Developed to Developing Regions with Special Reference to the Conditions of West Pakistan,
W74-00217 10A

Development of Mathematical Modeling Capabilities for the Vistula River Project, Poland,
W74-00218 10A

Methods of Transfer of Water Resources Knowledge from Developed to Developing Regions with Special Emphasis to On-Farm Water Management,
W74-00219 10A

Guidelines for Transfer of Practice to Applications for Optimum on Planning of Key Items of Water Resource Projects,
W74-00220 10A

New Frontiers in Drainage and Reclamation Engineering in the Indus Plains,
W74-00221 10A

An IHD Project for Technology Transfer to Developing Regions,
W74-00222 10A

The Role of FAO in the Transfer of Water Resources Knowledge to Developing Regions,
W74-00223 10A

Technical Activities by FAO in the Transfer of Water Resources Knowledge to Developing Regions,
W74-00224 10A

Transfer of Knowledge in Water Resources Policies from Developed to Developing Countries,
W74-00225 10A

Transfer of Water Resources Knowledge Through the United Nations Technical Assistance Activities,
W74-00226 10A

Recent Development of Hydrological Services in Colombia,
W74-00227 10A

Transfer of Water Resources Knowledge Aspects of the Work of the United Nations System,
W74-00228 10A

TEMPERATURE
High-Temperature, High-Pressure Extrusion of Chicken Excreta,
W74-00418 5D

TEMPERATURE MEASUREMENT
Semidiurnal Internal Tides in Massachusetts Bay,
W74-00504 2L

TENNESSEE
Natural Environmental Analysis, Nashville-Davidson County, Tennessee.
W74-00455 3D

TENNESSEE VALLEY
Regional Perspectives,
W74-00123 5G

TEST WELLS
Hydraulic Testing Accompanying Drilling of Five Exploratory Holes, Piceance Creek Basin, Colorado,
W74-00299 2F

TESTING
Results of an Operational Test of M-100 Radio-Electronic Snow Gages,
W74-00109 2C

TESTING PROCEDURES
Results of an Operational Test of M-100 Radio-Electronic Snow Gages,
W74-00109 2C

TEXAS
Effects of Watershed Development on Water Quality,
W74-00118 5C

Reliability of Urban Water Quality Management,
W74-00180 5G

Artificial-Recharge Experiments and Operations on the Southern High Plains of Texas and New Mexico,
W74-00325 4B

Rules, Regulations and Modes of Procedure, Relating to the Texas Weather Modification Act, V.A.T.S. Water Code, Chapter 14.
W74-00357 3B

Two Studies of Pesticide Residues,
W74-00529 5C

A Study of Pesticide Residue Levels and Insecticide Resistance in Selected Aquatic Organisms Occurring Around the Bryan-College Station Agricultural Production areas,
W74-00530 5C

A Survey of DDT Residues in Fish from the Brazos and Navasota Rivers and Somerville Reservoir,
W74-00531 5C

Regional Specific Yield of the Edwards and Associated Limestones in the San Antonio, Texas Area,
W74-00542 2F

Drainage Areas of Texas Streams, Lavaca River Basin.
W74-00548 2E

TEXAS (BRAZOS COUNTY)
Seasonal Variations in Selected Physicochemical Conditions of a Small Lake in Brazos County, Texas,
W74-00074 2H

TEXAS WATER PLAN
Optimal Allocation of Limited Water Resources,
W74-00179 6A

TEXTILES
A Fundamental Comparison of the Utility of Trichloroethylene and Perchloroethylene in the Application of Disperse Dyes to Polyester,
W74-00433 3E

THEORETICAL ANALYSIS
On the Quantitative Determination of Free Carbon Dioxide in Natural Waters, (Zur quantitativen Bestimmung der freien Kohlensaure in naturlichen Wassern),
W74-00263 2K

THERMAL POLLUTION
Water Temperature Surveys in the Vicinity of Power Stations with Special Reference to Infra-Red Techniques,
W74-00076 5A

THERMAL STRATIFICATION
Formation of Thermal Microstructure in a Narrow Embayment During Flushing,
W74-00517 2L

THERMAL WATER
The Dushanbe Artesian Basin and Its Mineral and Thermal Waters (Dushanbinskiy artezianskiy basseyn i yego mineral'nyye i termal'nyye vody),
W74-00117 4B

Enthalp, A Computer Program for the Calculation of Aquifer Chemistry in Hot-Water Geothermal Systems,
W74-00532 2F

THERMONUCLEAR EXPLOSIONS
Detection and Measurement.
W74-00010 5B

THERMONUCLEAR FUSION
Tritium Production.
W74-00009 5B

THERMONUCLEAR REACTORS
Detection and Measurement.
W74-00010 5B

THIN LAYER CHROMATOGRAPHY
Thin-Layer Chromatography and Enzyme Inhibition Techniques. Introduction,
W74-00254 5A

The Application of the Thin-Layer Chromatographic - Enzyme Inhibition Technique to Organochlorine Insecticides,
W74-00461 5A

THUNDERSTORMS
Variation of the Low Level Winds During the Passage of a Thunderstorm Gust Front,
W74-00545 2B

TIAL FLUSHING
Tidal Currents and Zig-Zag Sand Shoals in a Wide Estuary Entrance,
W74-00021 2L

TIDAL CURRENTS
Tidal Currents and Zig-Zag Sand Shoals in a Wide Estuary Entrance,
W74-00021 2L

TIDAL CYCLE
Tidal Variation of the Size Distribution of Suspended Sediment at a Station in the Chesapeake Bay Turbidity,
W74-00525 2L

TIDAL DATA
Tidal Relations Along the Intracoastal Waterway, Palm Beach, County, Florida,
W74-00328 2L

TIDAL EFFECTS
Tidal Currents and Zig-Zag Sand Shoals in a Wide Estuary Entrance,
W74-00021 2L

Biological and Chemical Features of Tidal Estuaries,
W74-00031 2L

Tidal Characteristics of Two Estuaries in Florida,
W74-00508 5B

Classification System for Estuaries,
W74-00511 2L

Salinity of Interstitial Water in a Sandy Beach,
W74-00523 2L

TIDAL INLETS
Water-Level Fluctuations and Flow in Tidal Inlets,
W74-00507 2L

TIDAL POWERPLANTS
Electrical Power Plant Driven by Ocean Waves and Tides,
W74-00092 8C

TIDAL STREAMS
Tidal Characteristics of Two Estuaries in Florida,
W74-00508 5B

TIDAL WATERS
Tidal Relations Along the Intracoastal Waterway, Palm Beach, County, Florida,
W74-00328 2L

TIDES
Patterns of Sediment Transport at Nearshore Zones Influenced by Wave and Tidal Currents: A Study Utilizing Fluorescent Tracers,
W74-00301 2L

Tidal Relations Along the Intracoastal Waterway, Palm Beach, County, Florida,
W74-00328 2L

TIME SERIES
Time Series Analysis of the Hydrologic Regimen of a Groundwater Discharge Area,
W74-00362 2F

TIME SERIES ANALYSIS
A Time Series from the Beach Environment,
W74-00017 2J

Annual Cycle in River Water Quality: A Time Series Approach,
W74-00372 5B

TOMALES BAY (CALIF)
Salinity of Interstitial Water in a Sandy Beach,
W74-00523 2L

TOPOGRAPHY
Sand Movement in Relation to Beach Topography,
W74-00020 2J

TOPSOILS
Mineralogy of Parent Materials, Topsoils and Erosion Products of Taita Experimental Station,
W74-00182 2G

TOXICITY
Land Reclamation and River Pollution Problems in the Croal Valley Caused by Waste From Chromate Manufacture,
W74-00045 5C

Toxicity of Droppings From Coumaphos-Fed Hens to Little House Fly Larvae,
W74-00410 5C

Toxicity to House Flies and Horn Flies of Manure from Insecticide Fed Cattle,
W74-00423 5G

Effects of Swine Lagoon Effluent on the Soil and Plant Tissue,
W74-00428 5D

Effects of Water Pollution on the Ichthyofauna: IV. Toxicity of Acids, Alkalies and Some Inorganic Gases,
W74-00489 5C

Toxicity of Polychlorinated Biphenyls (PCB) to Goldfish,
W74-00492 5C

TRACE ELEMENTS
Silica Gel as an Insoluble Carrier for the Preparation of Selective Chromatographic Adsorbents - The Preparation of 8-Hydroxyquinoline Substituted Silica Gel for the Chelation Chromatography of Some Trace Metals,
W74-00252 2K

Multielement Instrumental Neutron Activation Analysis of Biological Materials,
W74-00289 2K

Dynamics of Trace Elements in Liman-Meadow Soils of the Arid Zone of Central Kazakhstan, (In Russian),
W74-00479 5B

TRACE LEVELS
Application of High-Speed Liquid Chromatography to Organic Microanalysis. I. Construction of A Simple and Inexpensive Apparatus,
W74-00249 2K

Ultratrace Analysis (Below p.p.b.) by Coupling Centripetal Thin-Layer Chromatography and Gas Chromatography,
W74-00255 5A

Adsorption of Traces of Insecticides from Water on Polyethylene, (Adsorption von Spuren von Insecticiden aus Wasser an Polyathylen),
W74-00259 5A

A Study of the Variation with pH of the Solubility and Stability of Some Metal Ions at Low Concentrations in Aqueous Solution. Part II,
W74-00261 5A

Microdetection of Nitrate with Malachite Green or Congo Red,
W74-00273 2K

Improved Apparatus for Determination of Mercury by Flameless Atomic Absorption,
W74-00276 5A

Improvements in the Manganese Dioxide Collection of Trace Lead and Bismuth in Nickel,
W74-00281 2K

TRAINING
An IHD Project for Technology Transfer to Developing Regions,
W74-00222 10A

TRANSFER
Kinetics of Tritium in Biological Systems.
W74-00011 5B

TRANSMISSIVITY
Galerkin Solution of the Inverse Problem for Aquifer Transmissivity,
W74-00363 2F

TRANSPIRATION
Intensity of Plant Transpiration in Certain Varieties and Mutant Forms of Cotton, (In Russian),
W74-00026 3F

The Transpiration of Corn,
W74-00467 2D

TRANSPORT PHENOMENA (SURFACES)
Reactions and Transport Phenomena, at Surfaces,
W74-00162 3A

TRENT CANAL (ONTARIO-CANADA)
Reservoir Operation for Recreation Usability,
W74-00185 4A

TRICKLING FILTERS
Methods for Improvement of Trickling Filter Plant Performance. Part I. Mechanical and Biological Optima,
W74-00431 5D

TRITIATED WATER
Certain Environmental Aspects of Tritium.
W74-00012 5B

TRITIUM
Tritium Production.
W74-00009 5B

Detection and Measurement.
W74-00010 5B

Kinetics of Tritium in Biological Systems.
W74-00011 5B

Certain Environmental Aspects of Tritium.
W74-00012 5B

Environmental Monitoring Techniques.
W74-00013 5B

Separation of Water From Biological and Environmental Samples for Tritium Analysis,
W74-00053 5A

TROPICAL
Ecological and Floristic Convergences Between Seasonal Plant Formations of Tropical and Subtropical South America,
W74-00066 2I

TROPICAL CYCLINES
Tropical Cyclone Precipitation in New Jersey,
W74-00435 2B

TSUNAMIS
Initial Wave Scattering by an Inhomogeneous Medium and its Application to Shallow Water Waves,
W74-00513 2L

Effects of the Alaska Earthquake and Tsunami on Recent Deltaic Sediments,
W74-00524 2J

TUCSON (ARIZ)
Cost-Effectiveness Analysis of Disposal Systems,
W74-00184 5E

TURBIDITIES
Grain Size Studies on Turbidite Components From Tyrrhenian Deep Sea Cores,
W74-00100 2J

TURBIDITY
Biological and Chemical Features of Tidal Estuaries,
W74-00031 2L

Seasonal Variations in Selected Physicochemical Conditions of a Small Lake in Brazos County, Texas,
W74-00074 2H

Tidal Variation of the Size Distribution of Suspended Sediment at a Station in the Chesapeake Bay Turbidity,
W74-00525 2L

TURBIDITY CURRENTS
Grain Size Studies on Turbidite Components From Tyrrhenian Deep Sea Cores,
W74-00100 2J

Continuity of Turbidity Current Flow and Systematic Variations in Deep-Sea Channel Morphology,
W74-00348 2J

TUSCON (ARIZ)
Role of Digital Computer Models of Aquifers in Water Resources Planning: Case Study in Tucson, Arizona,
W74-00176 4B

TYRRHENIAN SEA
Grain Size Studies on Turbidite Components From Tyrrhenian Deep Sea Cores,
W74-00100 2J

U.S. ARMY CORPS OF ENGINEERS
An IHD Project for Technology Transfer to Developing Regions,
W74-00222 10A

U.S. GEOLOGICAL SURVEY
Experience of the U.S. Geological Survey in Transfer of Hydrologic Knowledge to the Developing Countries,
W74-00215 10A

UNDERGROUND
Summary of Chemical and Radiochemical Monitoring of Water for the Cannikin Event, Amchitka Island, Alaska, Fiscal Year 1972,
W74-00547 5B

UNDERWATER
Effects of Underwater Demolition on the Environment in a Small Tropical Marine Cove,
W74-00233 5C

UNITED KINGDOM
Whistling Sand Beaches in the British Isles,
W74-00104 2J

UNITED KINGDOM (CROAL RIVER)
Land Reclamation and River Pollution Problems in the Croal Valley Caused by Waste From Chromate Manufacture,
W74-00045 5C

UNITED NATIONS
Transfer of Knowledge in Water Resources From Research to Practice,
W74-00198 10A

Transfer of Knowledge in Water Resources Policies from Developed to Developing Countries,
W74-00225 10A

Transfer of Water Resources Knowledge Through the United Nations Technical Assistance Activities,
W74-00226 10A

Transfer of Water Resources Knowledge Aspects of the Work of the United Nations System,
W74-00228 10A

UNITED STATES
Development and Application of Large-Scale Water and Land Allocation Models for the United States.
W74-00174 6A

UNSATURATED FLOW
Modified Approach to Capillary Hysteresis Based on a Similarity Hypothesis,
W74-00368 2G

UPWELLING
Coastal Currents of the Western Gulf of Maine,
W74-00015 2H

Seasonal Variations of Coastal Currents Off the Oregon - Northern California Coast,
W74-00037 2L

Long Term Changes in Marine Ecosystem: Ecological Relationships Between Tomales Bay and Adjacent Shelf Waters,
W74-00038 2L

URBAN DEVELOPMENT
Need for Metropolitan Water Balance Inventories,
W74-00187 6A

URBAN IMPACT
Effects of Watershed Development on Water Quality,
W74-00118 5C

URBAN REFUSE
Conversion of Urban Refuse to Oil,
W74-00406 5D

URBAN RUNOFF
Methodology for Assessing the Potential Impact of Urban Development on Urban Runoff and the Relative Efficiency of Runoff Control Alternatives,
W74-00001 2A

Toxic Materials Analysis of Street Surface Contaminants,
W74-00306 5B

URBAN WATER
Reliability of Urban Water Quality Management,
W74-00180 5G

URBAN WATERFRONT
Water Development and Urban Recreation,
W74-00446 6B

URBAN WATERSHEDS
Interaction of Bulk Precipitation, Stream Water, and Sewage in a Small Watershed Near Oxford, Mississippi,
W74-00005 2A

URBANIZATION
Methodology for Assessing the Potential Impact of Urban Development on Urban Runoff and the Relative Efficiency of Runoff Control Alternatives,
W74-00001 2A

Demographic Effects of Water Development,
W74-00443 6D

Natural Environmental Analysis, Nashville-Davidson County, Tennessee.
W74-00455 3D

URINARY NITROGEN
Observations on the Effect of Protein Intake and Stage of Gestation on the Proportion of Urinary Nitrogen Excreted as Urea in Sheep,
W74-00408 5B

URINE
Gas-Chromatographic Determination of Selenium,
W74-00041 2K

The Determination of Chromium in Human Urine by Gas Chromatography Using a Flame Photometric Detector with a 425, 4 NM Filter,
W74-00270 5A

USE OF WATER
Water Use--Committee Report, Part II, Review of the Johns Hopkins University Research Project Method for Estimating Residential Water Use.
W74-00121 6D

USSR
Modification of Water Quality During Artificial Groundwater Recharge,
W74-00116 4B

USSR (BELAYA RIVER)
Hygienic Efficacy of Sanitary Protection Measures for Surface Waters in the Region of Oil-Refining and Oil-Chemical Enterprises, (In Russian),
W74-00241 5B

USSR (CARPATHIAN MOUNTAINS)
Runoff Formation on Mountain Slopes Under Carpathian Beech and Spruce Forests,
W74-00338 4A

USSR (DNIEPER RESERVOIR)
Role of Bacteria in the Feeding of Zooplankton of the Dnieper Reservoirs, (In Russian),
W74-00496 5C

USSR (FERGANA)
Some Characteristics of Nectar Production in the Mountain Honey Plants of Northern Fergana (In Russian),
W74-00235 3F

USSR (GOLODNAYA STEPPE)
Water-Salt Balance of Groundwater in the Golodnaya Steppe in 1969 (Vodno-solevoy balans podzemnykh vod Golodnoy stepi za 1969 god),
W74-00340 4B

USSR (KAZAKHSTAN)
Dynamics of Trace Elements in Liman-Meadow Soils of the Arid Zone of Central Kazakhstan, (In Russian),
W74-00479 5B

USSR (KIRGHIZIA)
Increasing the Effectiveness of Irrigated Agriculture in the Chuy Valley of Kirghizia, (In Russian),
W74-00490 3F

USSR (LAKE BAIKAL)
Role of Ultrananoplankton Algae in Primary Production in Lake Baikal During the Summer, (In Russian),
W74-00488 2H

USSR (LAKE BALKHASH)
Reconstruction of the Water Balance of Lake Balkhash (Rekonstruktsiya vodnogo balansa oz. Balkhash),
W74-00344 2H

USSR (LAKE SARYCHELEK)
New Data on Hydrologic Regimen of Lake Sarychelek (Novyye dannyyee po gidrologicheskomu rezhimu oz. Sarychelek),
W74-00342 2H

USSR (LOWER DON RIVER)
Effect of River Discharge Regulation on the Lower Don Phytoplankton, (In Russian),
W74-00120 5C

USSR (TAGANROG BAY)
Zoobenthos Resources and Productivity in the Gulf of Taganrog, (In Russian),
W74-00495 5C

USSR (TASHKENT)
Intensity of Plant Transpiration in Certain Varieties and Mutant Forms of Cotton, (In Russian),
W74-00026 3F

USSR (TIEN SHAN)
Investigation of Ice Movement on Mountain Glaciers by Stereophotogrammetry (Issledovaniye dvizheniya l'da gornykh lednikov stereofotogrammetricheskim metodom),
W74-00346 2C

USSR (TRANSBAYKALIA)
Quaternary Glaciation in Transbaykalia (Chetvertichnoye oledeneniye Zabaykal'ya),
W74-00343 2C

USSR (VOLGOGRAD RESERVOIR)
Estimation of Fish Production in the Volgograd Water Reservoir, (In Russian),
W74-00480 2H

UTAH
Physical-Chemical Treatment of a Municipal Wastewater Using Powdered Carbon,
W74-00154 5D

Ground-water Conditions in Utah, Spring of 1973,
W74-00353 4B

Loss of Particulate Organic Materials from Semiarid Watersheds as a Result of Extreme Hydrologic Events,
W74-00378 2A

Muddy Creek Dam and Reservoir, Emery County, Feasibility Study.
W74-00546 8A

UTILITIES
Assessing the Social Effects of Public Works Projects,
W74-00163 6B

UTILITY SYSTEM EXPANDION
Preliminary Report of Public Utilities Analysis.
W74-00458 3D

VAUCHERIA-DICHOTOMA
Studies on the Biology and Control of Vaucheria dichotoma Found in Freshwaters in Britain,
W74-00541 2I

VECTORS (YELLOW FEVER)
Survey of Potential Vectors of Yellow Fever in Tanzania, (In French),
W74-00242 5G

VEGETATION
Application of Ecological, Geological and Oceanographic ERTS-1 Imagery to Delaware's Coastal Resources Planning,
W74-00540 7B

VENEZUELA
Application of Hydrogeological Data to Long-Term Economics of Growing Sugar Cane in Venezuela,
W74-00196 10A

Venezuelan Experience on the Transfer of Knowledge in Water Resources Engineering,
W74-00213 10A

VIRGINIA
Electrical Resistivity Soundings on the Coastal Plain of Southeastern Virginia: A Feasibility Study,
W74-00437 2F

A Test of Mixing Length Theories in a Coastal Plain Estuary,
W74-00528 2L

VIRUSES
Some Biological Aspects of Channel Catfish Virus Disease,
W74-00231 5C

VOLTAMMETRY
Reactions and Transport Phenomena, at Surfaces,
W74-00162 3A

Voltammetric Determination of Nitrate and Nitrite Ions Using a Rotating Cadmium Disk Electrode,
W74-00251 2K

VOLUMETRIC ANALYSIS
A New Set of Acidity Constants for Carbonic Acid and Boric Acid in Sea Water,
W74-00046 5A

VOLUNTARY WASTE CONTROL
Education, Action and Regulatory Problems of Animal Waste Management,
W74-00133 5G

WALLEYE
Evaluation of Commercial Fishery Potential of Wisconsin's Boundary Waters of Lake Superior-Walleye,
W74-00094 8I

WASH WATER RECOVERY
Definition of Reverse Osmosis Requirements for Spacecraft Wash Water Recycling,
W74-00320 5D

WASHINGTON
Digital Simulation and Projection of Water-Level Declines in Basalt Aquifers of the Odessa-Lind Area, East-Central Washington,
W74-00326 2F

Mill Creek Fish Passage Facility,
W74-00351 8I

Formation of Thermal Microstructure in a Narrow Embayment During Flushing,
W74-00517 2L

Water Resources of the Nisqually Indian Reservation, Washington,
W74-00544 4A

WASTE DISPOSAL
Regional Livestock Waste Management Program,
W74-00127 5G

Application, Utilization and Disposal of Livestock Waste,
W74-00129 5G

Education, Action and Regulatory Problems of Animal Waste Management,
W74-00133 5G

Application, Utilization and Disposal of Livestock Wastes,
W74-00136 5G

Research Needs for the Design and Management of Beef Feedlot Runoff Control Systems,
W74-00137 5G

Characteristics of Livestock Waste and Runoff,
W74-00138 5G

Other Research Needs,
W74-00140 5G

Concluding Comments,
W74-00144 5G

Cost-Effectiveness Analysis of Disposal Systems,
W74-00184 5E

Movement of Pollutant Phosphorus in Saturated Soils,
W74-00392 5B

Analysis of Animal Waste Storage and Land Disposal Systems,
W74-00393 5D

Agriculture and Pollution--Socio-Economic Aspects,
W74-00395 5G

Engineering Agricultural Wastes,
W74-00397 5D

Soil Conditions Under Feedlots and on Land Treated with Large Amounts of Animal Wastes,
W74-00399 5B

Continuous Solid Waste Retort - Feasibility Study,
W74-00405 5D

Nitrate Content of Percolates from Manured Lysimeters,
W74-00417 5B

Human and Animal Wastes as Fertilizers,
W74-00419 5D

Manuring of Potatoes on Fen Silt Soils in Holland, Lincolnshire,
W74-00422 3F

Continued Recycling of Cattle Manure,
W74-00424 5D

Crop Yields from Land Receiving Large Manure Applications,
W74-00425 3C

Electric In-House Drying of Poultry Waste,
W74-00426 5D

Effects of Swine Lagoon Effluent on the Soil and Plant Tissue,
W74-00428 5D

WASTE MANAGEMENT
Research Needs for the Design and Management of Beef Feedlot Runoff Control Systems,
W74-00137 5G

A Recycled Feed Source From Aerobically Processed Swine Wastes,
W74-00412 5D

WASTE RUNOFF CONTROL
Research Needs for the Design and Management of Beef Feedlot Runoff Control Systems,
W74-00137 5G

WASTE STORAGE
Analysis of Animal Waste Storage and Land Disposal Systems,
W74-00393 5D

The Effect of Ration on Engineering Properties of Beef Cattle Manure,
W74-00420 5B

WASTE TRANSPORT
A Comparison of Three Systems for Transport and Treatment of Swine Manure,
W74-00416 5D

WASTE TREATMENT
Proceedings: Livestock Waste Management Research Review.
W74-00125 5G

National Livestock Waste Management Program,
W74-00126 5G

Application, Utilization and Disposal of Livestock Waste,
W74-00129 5G

Design and Management of Runoff Control Systems,
W74-00130 5G

Waste Management and Animal Performance,

W74-00165 5D

Estimating Regional Wastewater Treatment Costs,
W74-00169 5D

Pilot-Demonstration Project for Industrial Reuse of Renovated Municipal Wastewater,
W74-00305 5D

Research on Reverse Osmosis Membranes for Purification of Wash Water at Sterilization (165 deg F),
W74-00316 5D

Definition of Reverse Osmosis Requirements for Spacecraft Wash Water Recycling,
W74-00320 5D

Periodicity of the Blue-Green Algae and Their Effect on the Efficiency of Manure-Disposal Lagoons,
W74-00430 5D

Methods for Improvement of Trickling Filter Plant Performance. Part I. Mechanical and Biological Optima,
W74-00431 5D

Individual Home Aerobic Wastewater Treatment Systems,
W74-00434 5D

Report to the Governor and the Interim Finance Committee: Alternative Recommendation, Las Vegas Wash/Bay Pollution Abatement Project.
W74-00440 5D

Sewage and Waste Control Rules and Regulations for the Metropolitan Disposal System.
W74-00452 5G

Water Quality Program for Oahu with Special Emphasis on Waste Disposal: Final Report.
W74-00456 5D

Desmidiaceae of Waste Waters, (In Russian),
W74-00485 5D

WATER ALLOCATION (POLICY)

Development and Application of Large-Scale Water and Land Allocation Models for the United States.
W74-00174 6A

Optimal Allocation of Limited Water Resources,
W74-00179 6A

Agricultural Water Allocation, Land Use, and Policy,
W74-00186 3F

WATER ANALYSIS

Chemical and Biological Character of Rio Grande Water in the Bosque Del Apache Wildlife Refuge,
W74-00007 4A

Photodecomposition of the Herbicide Methazole,
W74-00050 5B

Polychlorinated Terphenyls in the Environment,
W74-00057 5A

Gas Chromatographic Procedure to Analyze Amino Acids in Lake Waters,
W74-00061 5A

The Probable Occurrence of Hydroxylamine in the Water of an Ethiopian Lake,
W74-00067 5A

Taste Thresholds of Halogens in Water,
W74-00119 5F

A System for Polyacrylamide Gel Electrophoresis of Humic Acids, (Ein System Zur Polyacrylamidgelelektrophorese Von Huminsauren),
W74-00260 5A

On the Quantitative Determination of Free Carbon Dioxide in Natural Waters, (Zur quantitativen Bestimmung der freien Kohlensaure in naturlichen Wassern),
W74-00263 2K

A Fluorometric Method for the Determination of Nitrilotriacetic Acid,
W74-00274 5A

The Solvent Extraction of the Ternary Complexes of Iron (II)-Rhodamine B With Various Nitrosophenols. Determination of Iron in Waters,
W74-00288 2K

A Simple Technique for the Differentiation of Escherichia Coli In Water Examination,
W74-00296 5A

Summary of Chemical and Radiochemical Monitoring of Water for the Cannikin Event, Amchitka Island, Alaska, Fiscal Year 1972,
W74-00547 5B

WATER BALANCE

Need for Metropolitan Water Balance Inventories,
W74-00187 6A

Water-Salt Balance of Groundwater in the Golodnaya Steppe in 1969 (Vodno-solevoy balans podzemnykh vod Golodnoy stepi za 1969 god),
W74-00340 4B

Reconstruction of the Water Balance of Lake Balkhash (Rekonstruktsiya vodnogo balansa oz. Balkhash),
W74-00344 2H

WATER BUDGET

Water Content in a Phytocoenosis, and Water Budget of a Ecosystem; Oak-Forest of Virelles, (In French),
W74-00474 2I

WATER CHEMISTRY

A Model for Chemical Exchange in the Basalt-Seawater System of Oceanic Layer II,
W74-00097 2K

Water Chemistry of Ellicott Creek, Western New York,
W74-00166 5A

Silica-Carbonate Alteration of Serpentine: Wall Rock Alteration in Mercury Deposits of the California Coast Ranges,
W74-00304 2K

Sigma-Inductive Model vs. Field Model. Observation of a Reversed Attenuation Effect,
W74-00323 2K

Mechanism of Transmission of Nonconjugative Substituent Effects. IV. Analysis of the Dissociation Constants of 6-Substituted Spiro (3.3) Heptane-2-Carboxylic Acids,
W74-00324 2K

WATER CIRCULATION

Sea-Surface Circulation, Sediment Transport, and Marine Mammal Distribution, Alaska Continental Shelf,
W74-00298 2J

WATER DEMAND

Water Use--Committee Report, Part II, Review of the Johns Hopkins University Research Project Method for Estimating Residential Water Use.
W74-00121 6D

Agricultural Water Allocation, Land Use, and Policy,
W74-00186 3F

Demographic Effects of Water Development,
W74-00443 6D

WATER EQUIVALENT

Effect of an Error in the Determination of the Maximum Water Equivalent of Snow in a Basin on the Forecast Accuracy of the Spring Flood Volume,
W74-00110 2C

Determination of Liquid Runoff from the Firn Field of a Glacier,
W74-00115 2C

WATER LEVEL
Reservoir Operation for Recreation Usability,
W74-00185 4A

WATER LEVEL FLUCATUATIONS
Digital Simulation and Projection of Water-Level Declines in Basalt Aquifers of the Odessa-Lind Area, East-Central Washington,
W74-00326 2F

WATER LEVEL FLUCTUATION
Differences in Littoral Fauna Due to Fluctuating Water Levels Below A Hydroelectric Dam,
W74-00463 2I

WATER LEVEL FLUCTUATIONS
Experimental Hydrodynamic Calculation of Aperiodic Water-Level Fluctuations in Estuaries,
W74-00114 2L

Tidal Relations Along the Intracoastal Waterway, Palm Beach, County, Florida,
W74-00328 2L

Digital Model of the Hydrologic System, Northern High Plains of Colorado--A Preliminary Report,
W74-00330 2F

Time Series Analysis of the Hydrologic Regimen of a Groundwater Discharge Area,
W74-00362 2F

Water-Level Fluctuations and Flow in Tidal Inlets,
W74-00507 2L

WATER LEVELS
Water-Level Records, 1969-73, and Hydrogeologic Data for Baca and Southern Prowers Counties, Colorado,
W74-00332 2F

WATER MANAGEMENT
Metropolitan Development Guide, Water Resources Policy Plan, Program.
W74-00451 6B

WATER MANAGEMENT (APPLIED)
Economic Analysis and Municipal Water Supply in Developing Countries,
W74-00190 10A

Water Resources Development Policies and Transfer of Knowledge from Developed to Developing Countries,
W74-00206 10A

WATER MITES
Changes in Fauna of Water Mites (Hydracarina) of Kierskie Lake, (In Polish),
W74-00078 5C

WATER MOTION
Water-Level Fluctuations and Flow in Tidal Inlets,
W74-00507 2L

WATER POLICY
Transfer of Knowledge in Water Resources Policies from Developed to Developing Countries,
W74-00225 10A

WATER POLLUTION
Pollution of Air, Water, and Soil by Livestock,
W74-00128 5G

Pollution of Air, Water and Soil by Livestock,

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Methods for chemical and biological identification and measurement of pollutants at the Analytical Quality Control Laboratory of the Environmental Protection Agency.
- Coastal pollution at the Oceanic Research Institute.
- Water treatment plant waste pollution control at American Water Works Association.
- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.

Subject Fields

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 7, NUMBER 2
JANUARY 15, 1974

W74-00551 -- W74-01100

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 7, NUMBER 2
JANUARY 15, 1974

W74-00551 -- W74-01100

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

ISOTOPE EFFECT AND THE MOLECULAR MECHANISM OF THE SECOND VISCOSITY COEFFICIENT OF WATER,
Louisiana State Univ., Baton Rouge. Dept. of Chemical Engineering.
E. McLaughlin.
Journal of Physical Chemistry, Vol 77, No 14, p 1801-1802, July 5, 1973. 1 fig, 1 tab, 10 ref.

Descriptors: *Water properties, *Viscosity, *Mathematical studies, *Mass transfer, *Isotope studies, *Heavy water, *Fluid mechanics, *Rheology, Viscous flow, Sound waves, Thermal conductivity, Theoretical analysis, Statistical methods, Shear.

In formulating statistical theories of transport process in liquids, information is needed on the molecular mechanism of transport. Such information can be obtained by studying the transport behavior of isotopic molecules in which masses and inertial moments can be altered without significantly affecting the parameters of the intermolecular potential. This method, which was used earlier to investigate shear viscosity and thermal conductivity, is applied to the examination of molecular mechanisms in the viscous processes determining the second viscosity coefficients of water. Appropriate sound-absorption data in ordinary and heavy water (deuterium oxide) are analyzed to derive the second viscosity coefficient. (Brown-IPC)

BIOTA OF FRESHWATER ECOSYSTEMS IDENTIFICATION MANUAL NO. 11 FRESHWATER UNIONACEAN CLAMS (MOLLUSCA:PELECYPODA) OF NORTH AMERICA,
Michigan Univ., Ann Arbor. Dept. of Zoology.
J. B. Burch.
Copy available from GPO Sup Doc as EP1.16:18050 ELD 03/73, $4.10; microfiche from NTIS as PB-224 831, $1.45. Environmental Protection Agency, Water Pollution Control Research Series, March 1973. 176 p, 154 fig, 71 ref. EPA Project 18050 ELD 03/73.

Descriptors: *Aquatic fauna, *Mollusks, *Pelecypods, *Mussels, Distribution, *North America, Data collections, *Biota.
Identifiers: *Identification manual, Illustrated key, *Unionacea, Species list.

Bivalved mollusks of the superfamily Unionacea (Order Schizodonta) are represented in North America by three families, 46 genera, and, as treated in this key, 221 species. The primitive Margaritiferidae are represented by two genera and four species, the Amblemidae by eight genera and 25 species, and the very large family Unionidae by 36 genera and 192 species. Systematics are not well worked out in many groups, which makes a definitive listing of species somewhat arbitrary at this time. The present key in most instances reflects a conservative approach to the lower taxa and, although it omits many nominal species of doubtful validity, the key nevertheless represents most of the biological species. Characters of soft anatomy are used to separate the families, subfamilies and, in a few cases, genera. Species are separated by shell characters. The main feature of this publication is an illustrated taxonomic key using both soft anatomy and shell characters for the identification of the North American Unionacea. SURFACE-GROUNDWATER RELATIONSHIPS ON THE EASTERN DNIESTER LEFT BANK (O VZAIMOSVYAZI POVERKHNOSTNYKH I PODZEMNYKH VOD NA VOSTOKE LEVOBEREZHNOGO PODNESTROV'YA),
Ukrainskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Kiev (USSR).
N. I. Drozd, and K. A. Lysenko.
In: Formirovaniye, raschety i regulirovaniye rechnogo stoka; Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 100, p 131-138, Moscow, 1971. 2 fig, 3 tab, 1 ref.

Descriptors: *Surface-groundwater relationships, *Rainfall-runoff relationships, *Streams, Recharge, Aquifers, Inflow, Hydrologic budget, Gaging stations, On-site investigations.
Identifiers: *Dniester River (USSR).

Computations of groundwater inflow to streams in the eastern Podolia Region from Ushitsa in the west to Kamenka and Beloche in the east were based on hydrologic observations by a network of gaging stations in 1946-65 and on on-site investigations by the Ukrainian Hydrometeorological Scientific Research Institute in 1967-68 and 1970. A gradual and steady increase in average monthly groundwater contribution to flow in the Batyg River at Zamekhov village ranging from 6 to 10 mm in 1949 and from 8 to 11 mm in in 1950 indicates a considerable lag in groundwater response to precipitation, i.e., a presence of large storage capacities in the principal aquifers discharging into the stream. Annual runoff and precipitation in 1947-65 and monthly runoff depths and precipitation in 1949-50 are tabulated for the river and bimonthly variations in precipitation and runoff of the river in 1949-50 are graphed. PREDICTION OF AIR TEMPERATURE AT A REMOTE SITE FROM OFFICIAL WEATHER STATION RECORDS,
Forest Service (USDA), Fort Collings, Colo. Rocky Mountain Forest and Range Experiment Station.
R. E. Campbell.
USDA Forest Serv. Res. Note RM-223, 1972. 4 p, 3 fig, 2 tab, 5 ref.

Descriptors: *Air temperature, Semiarid climates, Remote sensing, Meteorological data, Synoptic analysis, Weather patterns, Weather data, *Weather forecasing, Watershed management, *New Mexico.
Identifiers: *Temperature forecasting.

Air temperatures at the San Luis experimental watershed were predicted from temperatures at Albuquerque, New Mexico, on the basis of linear regressions between temperatures at the two locations calculated from a full year of continuous record at San Luis and official 3-hour records at Albuquerque. Hourly temperatures were predicted within plus or minus 6.3 to 7.8F., depending on time of day. Predictions of daily mean temperatures at San Luis were within plus or minus 3.8F. Monthly mean temperatures for a given time of day were predicted within plus or minus 3.6 to 5.5F. (Forest Service)

A COMPILATION OF STUDIES FROM ATMOSPHERIC VARIABILITY EXPERIMENT (AVE),
Texas A and M Univ., College Station. Dept. of Meteorology.
J. R. Scoggins, H. E. Fuelberg, R. D. Carlson, R. W. Phelps, and D. G. Bellue.
Available from NTIS, Springfield, Va 22151 as NASA CR-2304 Price $3.00 printed copy; $1.45 microfiche. National Aeronautics and Space Administration Contractor Report NASA CR-2304, August 1973. 192 p. NASA Contract NAS 8-26751.

Descriptors: *Meteorology, *Weather forecasting, *Southeast U.S., *Atmospheric physics, Data collections, Methodology, Air temperature, Rainfall, Winds, Wind velocity, Air circulation, Kinetics, Movement, Air masses, Weather patterns, Climatic data, Orography, Synoptic analysis, Correlation analysis, Satellites (Artificial).
Identifiers: *Atmospheric variability, Spacecraft, Aerospace technology, Rawinsonde data.

The importance of meteorological systems too small to be detected and analyzed from upper-air synoptic data taken at 12-hr intervals in local weather forecasts and variability of parameters such as wind, temperature, and stability, has long been recognized. Because of the importance of subsynoptic-scale phenomena in the design and operation of space vehicles and the need for a better understanding of these phenomena, the Aerospace Environment Division of NASA's Marshall Space Flight Center carried out a measurement program during the period February 19-22, 1964. Rawinsonde soundings were made at 30 stations over the eastern part of the United States south of the Great Lakes. Soundings were made at intervals of 3 hours at all stations except Huntsville, Alabama and Mississippi Test Facility (near New Orleans), where soundings were made at intervals of 1.5 hours. This is known as the Atmospheric Variability Experiment I (AVE I). Four studies conducted at Texas A and M University under NASA Contract, using the AVE I data, are described. A STUDY OF WINTER PRECIPITATION AREAS IN RELATION TO SEVERAL INDICATORS OF VERTICAL MOTION--CHAPTER I OF A COMPILATION OF STUDIES FROM ATMOSPHERIC VARIABILITY EXPERIMENT (AVE),
Texas A and M Univ., College Station. Dept. of Meteorology.
H. E. Fuelberg.
In: National Aeronautics and Space Administration Contractor Report NASA CR-2304, p 3-58, August 1973. 25 fig, 27 tab, 25 ref. NASA Contract NAS8-26751.

Descriptors: * Meteorology, *Rainfall, *Southeast U.S., *Weather forecasting, *Atmospheric physics, Air circulation, Meteorological data, Data collection, Methodology, Air masses, Advection, Weather patterns, Air temperature, Climatic data, Orography, Kinetics, Winds, Wind velocity, Synoptic analysis, Cloud physics, Satellites (Artificial), Correlation analysis.
Identifiers: *Atmospheric variability, Vertical motion, Orographic lifting, Omega equation, Vorticity equation, Aerospace technology.

Five methods for obtaining the sign of vertical motion at various levels in the atmosphere were investigated to determine which gave the best explanation for areas of rain and no rain in the southeastern United States during the period February 19-22, 1964. The methods used were the terrain-induced vertical motion, the kinematic method including the terrain effect, the adiabatic methods, the omega equation, and the vorticity equation combined with Dines' Compensation Principle. Orographic lifting was an important factor in producing the observed precipitation; 63% of the occurrence of rain and no rain at 130 data collection points was explained by terrain-induced vertical motion alone. Values of vertical motion obtained by the kinematic methods, including orographic lifting at 850 mb, produced the best agreement with observed areas; 80.8% of the data collection points were explained correctly. Various forms of the adiabatic method gave results for the 700-500-mb layer that explained about 72% of the points. The vorticity equation produced results at all levels that verified only about 50% of the time. When terms in the omega equation were added through use of constant multipliers, results comparable to the adiabatic method were obtained. Without this addition large uncertainties occurred. Maps showing areas where terms of the omega equation would indicate positive vertical motion did not correlate well with the observed rainfall patterns. (See also W74-00851) (Woodard-USGS)
W74-00852

TIME CHANGES IN GRADIENT AND OBSERVED WINDS--CHAPTER II OF A COMPILATION OF STUDIES FROM ATMOSPHERIC VARIABILITY EXPERIMENT (AVE),
Texas A and M Univ., College Station. Dept. of Meteorology.
R. D. Carlson.
In: National Aeronautics and Space Administration Contractor Report NASA CR-2304, p 59-121, August 1973. 26 fig, 4 tab, 29 ref, 3 append. NASA Contract NAS8-26751.

Descriptors: *Meteorology, *Weather forecasting, *Southeast U.S., *Atmospheric physics, *Wind velocity, Data collections, Methodology, Weather patterns, Climatic data, Meteorological data, Orography, Air circulation, Kinetics, Synoptic analysis, Satellites (Artificial).
Identifiers: *Atmospheric variability, Gradient wind speed, Aerospace technology.

With the advent of air travel, the space age, and numerical weather prediction, wind and its variability at all levels in the atmosphere have become important. Local time changes of the observed and gradient wind speeds were examined at 500 mb for 3-, 6-, and 12-hour time intervals. The correlation coefficients between the changes in the two wind speeds over 3 and 6 hours are statistically not significantly different from zero at the 5% level. For the two 12-hour time intervals studied, the correlation coefficients between the local time changes in the two wind speeds were 0.38 and 0.51 which were statistically significant at the 5% level. A qualitative examination of the 3-, 6-, and 12-hour change of the components of the observed and gradient wind speeds also showed poor results over 3 and 6 hours with improvements over 12 hours. Although the gradient wind speed is generally an acceptable approximation to the actual wind speed, the results of this investigation show that the changes in the gradient wind speed are a poor approximation to changes in the actual wind speed over 3- and 6-hour time intervals, with some improvement over 12-hour intervals. AN ANALYSIS OF INTERNAL ZONES OF DISCONTINUITY--CHAPTER III OF A COMPILATION OF STUDIES FROM ATMOSPHERIC VARIABILITY EXPERIMENT (AVE),
Texas A and M Univ., College Station. Dept. of Meteorology.
D. G. Bellue.
In: National Aeronautics and Space Administration Contractor Report NASA CR-2304, p 123-161, August 1973. 24 fig, 16 ref, append. NASA Contract NAS 8-26751.

Descriptors: *Meteorology, *Weather forecasting, *Southeast U.S., *Cyclones, Air temperature, Rainfall, Data collections, Methodology, Air masses, Weather patterns, Fronts (Atmospheric), Air circulation, Atmospheric physics, Kinetics, Satellites (Artificial), Correlation analysis, Synoptic analysis, Precipitation (Atmospheric).
Identifiers: *Atmospheric variability, Internal zones of discontinuity, Rawinsonde data, Aerospace technology.

Internal zones of discontinuity were investigated which resulted when an open wave in the Gulf of Mexico developed into an east coast cyclone on February 19, 1964. Cross sections of equivalent potential temperature were employed in the location of these zones, which were delineated on the basis of strong equivalent potential temperature gradients. Processes which caused variations in these zones with time were investigated by use of the frontogenetic function. The x- and z-component equations of this function were evaluated term-by-term and compared with the observed conditions in the cross sections of equivalent potential temperature. The results indicated that regions of intense frontogenesis were associated with strong gradients of equivalent potential temperature within the zones of discontinuity, and regions of intense frontolysis were associated with weak gradients. Also, changes in the slope of the discontinuities were associated with frontolytic/frontogenetic regions. The relationship between these changes in slope and changes in the precipitation patterns was examined, and a close association was found. Finally, the usefulness of the frontogenetic function in the study of the zones of discontinuity was pointed out, and the need was emphasized for more frequent and more accurate rawinsonde data. AN APPROACH TO THE DETERMINATION OF THE VARIABILITY OF WIND THROUGH THE USE OF QUASI-CONSERVATIVE THICKNESS FIELDS--CHAPTER IV OF A COMPILATION OF STUDIES FROM ATMOSPHERIC VARIABILITY EXPERIMENT (AVE),
Texas A and M Univ., College Station. Dept. of Meteorology.
J. R. Scoggins, and R. W. Phelps.
In: National Aeronautics and Space Administration Contractor Report NASA CR-2304, p 163-192, August 1973. 9 fig, 3 ref, 2 append. NASA Contract NAS8-26751.

Descriptors: *Meteorology, *Weather forecasting, *Southeast U.S., *Atmospheric physics, *Winds, Data collections, Wind velocity, Wind pressure, Air temperature, Boundary layers, Correlation analysis, Air masses, Air circulation, Kinetics, Satellites (Artificial).
Identifiers: *Atmospheric variability, *Quasi-conservative thickness fields, Aerospace technology.

Atmospheric Variability Experiment (AVE) data are analyzed for February 19-20, 1964, to relate changes in measured wind on selected constant-pressure surfaces to changes in the thermal wind for a layer below the constant-pressure surface. Layers of various thicknesses are considered with the base of 950 mb, and others with bases at higher levels. The tops of the layers ranged from 700 to 300 mb. With the assumption of constant wind direction with height, areas with changes in the measured wind at the top of a layer and changes in the thermal wind within the layer less than or equal to 5m/sec coincided closely for thick layers and time intervals exceeding about 6 hrs. The linear correlation coefficient between changes in the measured and thermal winds less than or equal to 5 m/sec (positive or negative) was positive and significantly different from zero at the 5% level. Changes over periods of 3, 6, 9, and 12 hrs were considered in the analysis. (See also W74-00851) (Woodard-USGS)

ICINGS DEVELOPED FROM SURFACE WATER AND GROUND WATER,
Regions Research and Engineering Lab. Hanover, N.H. Cold Regions Research and Engineering Lab.
K. L. Carey.
Cold Regions Science and Engineering Monograph III-D3, May 1973. 65 p, 37 fig, 80 ref. Contract DA 4A062112A894.

Descriptors: *Ice, Highway icing, Ice cover, Cold regions, Surface-groundwater relationships, Freezing, Thawing, Permafrost.
Identifiers: *Icings, *Naleds.

Existing knowledge of the occurrence, control, and prevention of icings is summarized. A brief history of icing studies, general descriptions of icings, engineering significance of icings, origins of icings and factors affecting icing formation, techniques for studying icings, techniques for counteracting icings, avoiding icing problems in new construction, and a selected bibliography are included. Icings which are developed from surface water and groundwater can occur either naturally or as a result of man's activities in the cold regions. Thus the icing phenomenon occupies the unusual position of being either a product of the physical environment, or an inadvertently introduced and potentially disruptive influence in the environment. PROBLEM OF SIMPLIFYING SNOWMELT COMPUTATIONS (K VOPROSU OB UPROSHCHENNOM RASCHETE SNEGOTAYANIYA),
Ukrainskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Kiev (USSR).
V. A. Romanenko.
In: Formirovaniye, raschety i regulirovaniye rechnogo stoka; Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 100, p 42-47, Moscow, 1971. 2 fig, 2 tab, 8 ref.

Descriptors: Analytical techniques, *Snowmelt, *Melting, *Runoff, Water storage, Air temperature, Methodology.
Identifiers: USSR.

Despite snowmelt computation methods based on solution of the heat-balance equation of melting snow, the application of temperature coefficients of snowmelt for simplified mass computations is valid and expedient. A method is presented for determining snowmelt coefficients from integral curves of the relation between loss in snow storage in areas of simultaneous snowmelt and air temperatures. The method can be used to determine the temperature coefficient of snowmelt as the tangent of the angle of inclination of the line to the snow-storage temperature axis. AVALANCHES IN OUR WESTERN MOUNTAINS: WHAT ARE WE DOING ABOUT THEM,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
K. Williams.
Weatherwise, Vol 25, No 5, p 220-227, 1972.

Descriptors: *Avalanches, Disasters, Meteorology, *Snow, *Storms, Synoptic analysis, Weather patterns, *Washington.
Identifiers: Avalanche research, Avalanche zoning, *Cascades (Wash).

Two snow storms which produced major avalanche cycles in Washington's Cascades are studied in detail. Approximately 850 avalanches were recorded during these storms, resulting in loss of life and property. The meteorological features of these storms are examined. The various ways in which the avalanche problem is being handled are discussed. These include special weather forecasts and avalanche warnings, the National Avalanche School, avalanche control measures, protective structures, avalanche zoning, and avalanche research. (Forest Service)

SIMULATED SONIC BOOM AS AN AVALANCHE TRIGGER,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
M. Martinelli, Jr.
USDA Forest Service Research Note RM-224, 1972. 7 p, 5 fig, 2 tab, 10 ref.

Descriptors: *Avalanches, *Snowpacks, *Snow cover.
Identifiers: *Sonic boom.

A linear array of detonating cord was used to simulate a sonic boom. The boom from such charges was directed toward the fracture zone of a small avalanche path where the snow was unstable, as indicated by natural avalanches in the area. On three of four tests, avalanches were released by a boom of 12 pounds per square foot (60 kg f/m2) over-pressure after withstanding lesser booms. One of the avalanches had a fracture face 8 feet 11 inches (272 cm) deep. (Forest Service)

SNOW FENCES FOR INFLUENCING SNOW ACCUMULATION,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
M. Martinelli, Jr.
In: Proceedings International Symposia on Role of Snow and Ice in Hydrology, Symposium on Measurement and Forecasting, Banff, Alberta, Canada, September 6-13, 1972. Sess. WMO-5. 6 p, 9 ref.

Descriptors: *Snow management, *Snowpacks, Snow cover, Blizzards, *Colorado.
Identifiers: Blowing snow, *Snow fences, *Mount Bethel (Colo).

The following items that influence the efficiency of collecting snow fences are discussed briefly: height, density and length of fence, bottom gap, length and maximum depth of lee drift, cumulative effect of a set of tandem fences, tilting of fence, terrain effects, and contributing distance. The snow fence project on Mount Bethel in Central Colorado is cited as a practical example of how some of the above items were used to design and lay out snow fences intended to reduce the amount of wind-blown snow deposited in the starting zone of an avalanche that crosses an interstate highway. (Forest Service)
W74-00684

WEATHER CONDITIONS THAT DETERMINE SNOW TRANSPORT DISTANCES AT A SITE IN WYOMING,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
R. D. Tabler, and R. A. Schmidt.
In: Proceedings, International Symposia on the Role of Snow and Ice in Hydrology, Symposium on Properties and Processes, Banff, Alberta, Canada, September 6-13 1972. 7 p, 4 fig, 6 ref.

Descriptors: Snow, *Sublimation, *Blizzards, *Weather, Snow cover, Snow packs, Winds, Shelterbelts, Snowfall, Snow management, Windbreaks, Water conservation, Water sources, Water balance, Watershed management, *Wyoming, Demonstration watersheds.
Identifiers: *Blowing snow, *Snow transport, Snow drifting, Snow fences, Induced snow accumulation, *Snowdrifts.

A mathematical model for the sublimation of wind-blown snow has recently been published. In a simplified form, the model predicts the distance a particle of given size will travel before completely sublimating; critical variables are particle speed, relative humidity and temperature of the air, and total insolation. Measurements of these conditions, at a site in southeastern Wyoming (elevation 2500 meters) during all drifting events over the 1970-71 winter, indicate average transport distances of 460 and 900 meters, for particle diameters of 0.010 and 0.015 cm, respectively. GENERALIZATION OF HAEFELI'S CREEP-ANGLE ANALYSIS,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
R. I. Perla.
Journal of Glaciology, Vol 11, No 63, p 447-450, 1972. 2 fig, 5 ref.

Descriptors: Snowpacks, Avalanches, *Stress analysis, Creep.
Identifiers: Snow mechanics, *Slab mechanics, *Creep angle.

Using geometrical arguments, Haefeli developed a stress analysis for slabs of compressible viscous materials. His analysis was based on a key parameter called the creep angle. A generalization of the creep angle, called the deformation-rate coefficient, is derived by replacing geometrical arguments with continuum mechanics. Once the deformation-rate coefficient is found from in situ

measurements, the stress field of the slab can be determined from a set of hyperbolic partial differential equations. (Forest Service)

ISUA, GREENLAND: CALCULATIONS OF GLACIER FLOW FOR AN OPEN-PIT MINE,
Cold Regions Research and Engineering Lab., Hanover, N.H.
S. C. Colbeck.
Research Report 309, July 1973. 24 p, 14 fig, 1 tab, 11 ref, append.

Descriptors: *Glaciers, *Flow, *Movement, *Mining, Rheology, Excavation, Mine water, Water balance.
Identifiers: *Greenland.

A large mineral deposit was discovered at Isua, in southwest Greenland. In addition to the usual problems of mining in the subarctic regions, the exploitation of this mineral resource is complicated by the fact that it lies at the edge of the Greenland Ice Cap. Most of the ore is covered by ice (up to 150 m thick) and, as the ice is stripped away to expose the ore, additional ice flow into the area of the pit is expected. The most favorable profile for the ice surface next to the open pit was calculated. Seven cross sections of flow were considered and in each case the flow characteristics of the most favorable profile were calculated: The results of these cross sections were averaged around the upstream edge of the pit in order to calculate the excavation necessary to establish a favorable profile and the yearly excavation necessary to maintain that profile. DEVELOPMENT OF A SNOWMELT-RUNOFF MODEL FOR THE U.S. TUNDRA BIOME, PROGRESS REPORT,
S. L. Dingman.
International Biological Program, U.S Tundra Biome Report 73-3, June 1973. 43 p, 10 fig, 4 tab, 14 ref, 4 append.

Descriptors: *Snowmelt, *Runoff, *Arctic, *Alaska, *Streamflow forecasting, Mathematical models, River basins, Equations, Dead storage, Topography, Flow rates, Snowpacks, Water equivalent.
Identifiers: *Barrow (Alaska).

Progress in applying a simple three-parameter equation to the simulation of snowmelt runoff on the Arctic Coastal Plain is described. The parameters are: (1) the amount of water held in 'dead storage' on the basin, S2; (2) a timing parameter, K, that depends on the physical characteristics of the basin; and (3) a parameter, N, that depends on the mode of flow within the basin. The three parameters are best determined by examining streamflow records from the basin to be modeled. The equation is incorporated and tested in a series of three computer simulation programs of increasing complexity. The final form inclued an accounting for varying water equivalents on varying proportions of the basin. The results of the tests of this model against measured snowmelt runoff from a 1.45 sq mi basin near Barrow, Alaska, indicate that the model is very promising, and should be tested and developed further. Data requirements, advantages, and disadvantages of the model are discussed. (Woodard-USGS)

Descriptors: *Watershed management, *Watersheds (Basins), *Erosion control, *Water yield, *Storm runoff, Overland flow, Slopes, Discharge (Water), Probability, Equations.
Identifiers: *European USSR, Traveltime, Nomograms.

The southwestern part of European Russia is located in a zone of intense rainfall activity. Heavy rains (100 mm or more) occur each year and cause severe gully erosion. Recommendations are developed for calculating maximum storm runoff in designing erosion control structures on eroded lands of natural watersheds. These recommendations can be used to calculate maximum discharges and storm-runoff volumes of varying probabilities for very small watersheds and channel-free slopes in southwestern regions of European Russia. THE ROCKY MOUNTAIN MILLIVOLT INTEGRATOR FOR USE WITH SOLAR RADIATION SENSORS,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
J. R. Thompson, and A. D. Ozment.
USDA Forest Service Research Note RM-225, 1972. 8 p, 8 fig, 11 ref.

Descriptors: *Electronic equipment, *Instrumentation, On-site data collections, Solar radiation.
Identifiers: *Solar radiation integrator, *Millivolt integrator.

Electronic integration of a radiometer's millivolt signal is a practical and accurate means of obtaining hourly, daily, weekly, or long-term radiation values. One such instrument has recently been designed and built by the Rocky Mountain Station. It consists of four printed circuit boards, a synchronous bi-directional stepper motor, and a five-decade counter. Each integrator is calibrated to match the millivolt output of the radiation sensor, so that the counter reads directly in langleys. The totalizing of a signal from a typical net radiometer (with a 6.20mv/langley output) would be within plus or minus 1 percent over most of the positive signal range, but could be 5 percent too low at night when the sensor output is negative. RELATIONSHIP OF TRANSPIRATION TO ATMOSPHERIC VAPOR PRESSURE,
Arizona Univ., Tucson.
F. D. Cole, and J. P. Decker.
Journal of the Arizona Academy of Science, Vol 8, No 2, p 74-75, June 1973, 2 fig, 5 ref.

Descriptors: *Transpiration, *Evapotranspiration, *Humidity, *Vapor pressure, Consumptive use, Plant growth, *Beans, Leaves.

Transpiration of illuminated bean plants was determined by measuring weight loss while plants were exposed to air of constant humidity, temperature, and circulation. The vapor pressure of water within the leaves was computed from internal temperatures measured with thermocouples. Vapor pressure of external air was measured directly by infrared gas analysis. Transpiration rate was then determined to be linear, but not a proportional function of the difference between these two vapor pressures. In a similar study using an atmometer instead of a plant, evaporation varied linearly and nearly proportionally with vapor pressure difference. The disproportionalities are interpreted as indicating that the temperature of the thermocouple consistently exceeded the temperature of the actual evaporating surface. The determination of this relationship of transpiration to atmospheric vapor pressure is especially significant in arid regions where water loss through transpiration is most important since such a relationship can help estimate the amount of water lost in this manner. NEW POINTS OF VIEW ON THE PHYTOGEOGRAPHIC POSITION OF THE HIGH ARDENNES, (IN GERMAN),W. VAN COTTHEM.
Ghent Rijksuniversiteit (Belgium). Laboratorium voor Systematiek Morfologie.

Biol Jaarb. 39 p 122-144. 1971, Illus.
Identifiers: *Ardennes region, Belgibum, Climates, *Evapotranspiration, France, Geographic, Luxembourg, Soils, Transpiration, Vegetation, *Phytogeographic position.

The exact phytogeographic position of the High Ardennes (France-Belgium-Luxembourg) has not been definitively determined. Some believe that the high Ardennes plateaus deserve the rank of a district, while others consider tham a subdistrict of the vast Ardennes district. It is not considered a separate district according to the Braun-Blanquet definition. It is suggested that data on potential evapotranspiration for different localities (Thornthwaite's climatic classification) would help establish direct relations between the vegetation, and soil and the climate.--Copyright 1973, Biological Abstracts, Inc.

RIVER MILE INDEX--NAPA, SALINAS, AND EEL RIVER BASINS, CALIFORNIA.
Federal Power Commission, San Francisco, Calif. Regional Office.

Pacific Southwest Inter-Agency Committee, Water Management Technical Subcommittee report, June 1973. 37 p, 2 fig.

Descriptors: *Distance, *River systems, *Indexing, *California, Documentation, River basins, Tributaries, Drainage area, Elevation.
Identifiers: *River mile index, *Pacific Southwest, Napa River basin (Calif), Salinas River basin (Calif), Eel River basin (Calif).

This river mile index for the Napa, Salinas and Eel River basins in California is one of a series of reports for stream basins in the Pacific Southwest. River mileages were determined from independent measurements made on U.S. Geological Survey topographic quadrangles. The U.S. Geological Survey furnished information on stream gage locations, drainage areas, and water elevations at key points. Streams are designated by order number to indicate their relationship in the basin network. First order streams are main stem streams with an outlet on the sea. Tributaries to these are second order, tributaries to second order are third order, etc. In making the index, the river mile distances were measured upstream from the mouth to the nearest tenth of a mile. Descriptors: *Flood waves, *Flood flow, *Flood routing, *Reservoirs, *Discharge (Water), Flood discharge, Stage-discharge relations, Hydrographs, Reservoir storage, Inflow, Gaging stations, Hydroelectric plants.
Identifiers: USSR, *Dnieper River.

Construction of reservoirs and operation of hydroelectric powerplants have altered the natural water regime of the Dnieper River. To compute flood-wave movement in reservoirs, a study was made of the 75-year flood which occurred on the Lower Dnieper between Kiev and Kakhovka in the spring of 1970. Factors responsible for the spring flood on all rivers forming inflow to the reservoir of the Kiev Hydroelectric Powerplant and to Kiev were analyzed. Computations were performed in many variants of water flow from inlet gaging stations on the Pripyat', Dnieper, Sozh, and Desna Rivers to Kakhovka. These include routing in 16 river reaches and 5 reservoirs by procedures developed to show the regulating effect of the reservoir cascade on spring runoff of the Lower Dnieper. Computation errors did not exceed 10% for over 50% of the outflow discharges in each reservoir and were within limits of 5% for about 40% of the discharges. (See also W74-00592) (Josefson-USGS)

In: Formirovaniye, raschety i regulirovaniye rechnogo stoka; Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 100, p 75-85, Moscow, 1971. 3 fig, 2 tab, 4 ref.

Descriptors: *Flash floods, Rivers, *Flood discharge, *Peak discharge, *Flood stages, Flood damage, Runoff, Runoff coefficient, Precipitation (Atmospheric), Hydrographs, Water levels.
Identifiers: USSR, *Ukraine, *Carpathian Mountains.

Catastrophic floods produced by continuous heavy rains occurred in the Dniester, Prut, Seret, and Tisza River basins in the Ukrainian Carpathians in Jun 1969 and May 1970. Heaviest rains occured June 7-10, 1969, and the precipitation which fell in the Chernovtsy, Ivano-Frankovsk, and L'vov Oblasts in June (200-400 mm) exceeded the average monthly value by more than 300%. The floods inundated populated areas, agricultural lands and livestock farms, and damaged railroads, highways, bridges, oil wells and fields, high-tension powerlines, gas mains, building enterprises, etc. Rainfall of a duration of 25-40 hours covered an area of about 22,000 sq km. Rains were heaviest in upper reaches of the Bystritsa Nadvornyanskaya, Bystritsa Solotvinskaya, Lomnitsa, and Prut Rivers, where precipitation amounted to about 300 mm. Maximum flood stages and peak discharges were the highest recorded in the last 100 years on some reaches of the Stryy, Lomnitsa, Bystritsa Solotvinskaya, Bystritsa Nadvornyanskaya and upper reaches of the Prut and Seret Rivers in June 1969 and on the Tisza River in May 1970. To study flood flormation conditions and to determine peak discharges, investigations were carried out by the Ukrainian Hydrometeorological Scientific Research Institute and by hydrologic stations of the Ukrainian Hydrometeorological Service. Flood-discharge hydrographs were constructed, and flood duration and runoff depths and coefficients were determined. Flood characteristics on Carpathian rivers in June 1969 and peak discharges on Carpathian rivers in May 1970 are tabulated. (See also W74-00592) (Josefson-USGS)

Descriptors: *Flood flow, *Floods, Rivers, *Tributaries, Watersheds (Basins), Surface-groundwater relationships, Rainfall-runoff relationships, Snowmelt, Soil moisture, Freezing, Seasonal.
Identifiers: *Ukraine, Carpathian Mountains, *Stryy River (USSR), *Bystritsa River (USSR).

Flood formation conditions during warm and cold periods of the year were investigated on two large physiographically similar mountain tributaries of the Dniester River: Stryy to Mezhibrod (drainage area--2,400 sq km) and Bystritsa to Yamnitsa (drainage area--2,450 sq km). Recommendations were developed for computing daily water yield from snow and rainwaters with allowance for basin elevation. A relation of runoff depth of rainfall and rainfall-snowmelt floods to daily water flow onto the basin surface, preflood groundwater discharge, soil moisture content, and depth of soil freezing was established for the Stryy and Bystritsa Rivers. COMPARISON OF FIELD METHODS FOR MEASURING STREAM DISCHARGE,
New York State Dept. of Environmental Conservation, Delmar. Wildlife Research Lab.
R. Engstrom-Heg.
N Y Fish Game J. Vol 18, No 2, p 77-96, 1971, Illus.
Identifiers: Discharge, Field methods, Measurement, *Stream discharge, *Salt-dilution methods, *Gaging.

Stream discharges were measured by a modification of Embody's float method and by 2 salt-dilution methods using a specific condictivity meter. In one of the latter, salt solution was introduced from a plastic constant-flow carboy. In the other, salt was introduced by solution from pre-weighed salt blocks. A precise relationship between NaCl concentration, temperature and specific conductivity is given in nomographic form, permitting rapid determination of changes in salt concentration. Comparison with US Geological Survey stream-gage readings showed that each method, when used in a suitable location, provided discharge measurements sufficiently accurate for most aquatic biological applications. The salt-dilution methods, in particular, can be used in very shallow, very turbulent and very sluggish streams where the more standard current-meter method is not applicable. Between them, the 3 methods described provide means for fairly rapid, easy and inexpensive gaging of the great majority of small and medium-sized streams.--Copyright 1973, Biological Abstracts, Inc.

BIBLIOGRAPHY OF REPORTS ON THE WATER RESOURCES OF INDIANA PREPARED BY THE U.S. GEOLOGICAL SURVEY, 1886--1972,
Geological Survey, Indianapolis, Ind.
M. J. Wilson.
Open-file report, 1973. 35 p, 1 fig, 3 tab.

Descriptors: *Bibliographies, *Water resources, *Water quality, *Indiana, Surface waters, Groundwater, Hydrologic data, Data collections, Streamflow, Flow rates, Aquifer characteristics, Water wells, Water yield, Water utilization, Hydrology, Hydrogeology, Chemical analysis, Water analysis, Water chemistry, Publications.
Identifiers: Water supply papers.

This bibliography contains a complete history to December 1972 of reports relating to the water resources of Indiana prepared by U.S. Geological Survey personnel. Many of the reports discuss related subjects of geology, hydrology, and chemical quality of the water. The bibliography is divided into three major parts: (1) publications of the U.S. Geological Survey; (2) open-file reports of the Geological Survey; and (3) other publications--reports prepared by Survey personnel but published by other agencies or by professional organizations in their journals. An index to the bibliography is included. Annual USGS water-supply papers are listed, by number and period of time covered, in three tables: (1) groundwater, (2) surface water, and (3) water quality. QUANTITY AND CHEMICAL QUALITY OF LOW FLOW IN THE UPPER COLORADO RIVER BASIN, TEXAS, APRIL 8, 1968,
Geological Survey, Austin, Tex.
J. Rawson.
Texas District open-file report, September 1973, 24 p, 3 fig, 2 tab, 5 ref.

Descriptors: *Base flow, Flow rates, *Water quality, *Texas, Streamflow, Chemical analysis, Basic data collections, Drainage area, Geology, Stream gages, Water analysis, Water chemistry, Geochemistry, Surface-groundwater relationships, *Low flow, Salinity, *Dissolved solids.
Identifiers: *Colorado River basin (Tex.).

Changes are defined in the quantity and quality of flow in a 103.2-mile reach of the Colorado River below Lake J. B. Thomas on April 8, 1968, a period when most of the flow was sustained by groundwater effluent. Flow in the reach increased from zero at mile 836.6 to 5.53 cfs at mile 733.4. Measured inflow from tributaries totaled 5.81 cfs. Thus, the interchange of surface and groundwater in the main-stem Colorado River resulted in a net loss of 0.28 cfs. The interchange of surface water and groundwater in the reach, supplemented by the inflow from tributaries, resulted in a net decrease in the concentration of dissolved solids from 16,900 mg/liter at mile 826.3 to 4,140 mg/liter at mile 733.4. However, significant increases in the concentration of dissolved solids occurred within some of the subreaches. The largest increase occurred in the subreach between mile 813.4 and mile 796.3 which is underlain by the Dockum Group. Dissolved solids in this subreach increased from 3,600 mg/liter at the upstream end of the reach to 6,660 mg/liter at the downstream end. (Woodard-USGS)

THE NATIONAL QUALITY OF GROUND WATER IN MINNESOTA,
Geological Survey, St. Paul, Minn.
T. C. Winter.
In: Proceedings of Conference on Toward A Statewide Ground Water Quality Information System and Report of Ground Water Quality Subcommittee, Citizens Advisory Committee, Governors Environmental Quality Council: University of Minnesota Water Resources Research Center Mimeographed Report, p 11-29, February 1973. 9 fig, 13 ref. 14-31-0001-3823.

Descriptors: *Water quality, *Groundwater, *Minnesota, Water chemistry, Water analysis, Water resources development, Water management (Applied), Data collections, Hydrologic data.

Groundwater occurs in four hydrogeologic environments in Minnesota; fractures in crystalline rocks, Paleozoic sedimentary rocks, Cretaceous sedimentary rocks, and glacial drift. The chemical

and mineralogic properties of these rocks and the movement of water through them results in the occurrence of distinct water-quality types in the State. Chemical analyses of ground water samples collected throughout the State were classified by a graphical technique. Calcium magnesium bicarbonate type water occurs throughout the State and predominates in the eastern three-fourths. Calcium magnesium sulfate, sodium bicarbonate, and sodium chloride types of groundwater occur in complex vertical and areal relationships in western Minnesota. The occurrence of water having dissolved-solids content greater than 1,000 milligrams per liter is limited largely to northwest and southwest Minnesota, where water types other than calcium magnesium bicarbonate are common. GROUNDWATER RESOURCES OF THE USSR (RESURSY PODZEMNYKH VOD SSSR),
All-Union Scientific Research Inst. of Hydrogeology and Engineering Geology, Moscow (USSR).
N. I. Plotnikov.
Vodnyye Resursy, No 1, p 140-150, 1973. 3 tab.

Descriptors: *Groundwater resources, *Groundwater availability, *Freshwater, *Water supply, Groundwater mining, Safe yield, Water demand, Water users, Irrigation, Water utilization, Withdrawal, Exploitation, Exploration, Hydrogeology, Forecasting.
Identifiers: *USSR.

Distribution of fresh groundwater in the USSR is extremely uneven. Primary known sources of fresh groundwater are located in artesian basins of platforms and geosynclines; sandy-gravelly deposits of river valleys and piedmont alluvial fans; sandy-gravelly fluvioglacial formations; and in carbonate rocks. Present fresh groundwater use in the USSR relative to total known resources is about 6%. For individual Union Republics, the percentage is much higher: Armenia (96%), Turkmenistan (77%), Moldavia (75%), Azerbaydzhan (52%), and the Ukraine (36%). A large amount of fresh groundwater (313 cu m/sec) is used to meet domestic, municipal, and industrial water supply demands. Water supplied to over 62% of Soviet cities is derived entirely from the groundwater reservoir. Groundwater withdrawals for urban water supply are 150 cu m/sec in the RSFSR, 50 cu m/sec in the Ukraine, 20 cu m/sec in Uzbekistan, 16 cu m/sec in Kazakhstan, 12 cu m/sec in Belorussia and Georgia, and about 10 cu m/sec in Armenia. According to incompiete figures, fresh groundwater withdrawals for irrigation total 300 cu m/sec, including 130 cu m/sec in the Ukraine, 60 cu m/sec in Azerbaydzhan, 38 cu m/sec in Armenia, about 25 cu m/sec in Tadzhikistan, and about 16 cu m/sec in Uzbekistan. Known fresh groundwater resources in the USSR and degree of their exploration and use by Union Republics are tabulated, and basic trends in the development of hydrogeology and problems confronting the Hydrogeological Service of the USSR are outlined. (Josefson-USGS)

PATTERNS OF LONG-TERM NATURAL FLUCTUATIONS OF GROUNDWATER LEVELS (ZAKONOMERNOSTI MNOGOLETNIKH YESTESTVENNYKH KOLEBANIY UROVNEY PODZEMNYKH VOD),
Akademiya Nauk SSSR, Moscow. Institut Vodnykh Problem.
V. S. Kovalevskiy.
Vodnyye Resursy, No 1, p 161-177, 1973. 10 fig, 18 ref.

Descriptors: *Groundwater movement, *Water level fluctuations, *Water table, Aquifers, Zone of aeration, Depth, Hydrogeology, Cycles, Correlation analysis, Histograms, Forecasting.
Identifiers: *USSR.

Analysis of long-term groundwater-level fluctuations is usually reduced to a determination of possible long-term changes in aquifer thicknesses or possible changes in groundwater depths. The extent of long-term fluctuations depends on the relation of the aquifer to the ground surface and on the hydrogeology, geological structure, geomorphology, microrelief, and climatic conditions of the region. Long-term cyclic fluctuations of groundwater levels have no strict periodicity in time, and cycle designations are arbitrary. For forecasting, the presence of clear groupings of successive low- and high-water years must be established. Relation of seasonal annual and long-term average annual ranges of groundwater-level fluctuations depends on the thickness of the zone of aeration. Ranges of long-term groundwater-level fluctuations are generally directly proportional to the length of the cycle period. Small (2, 3 and even 5-7 year) cycles are observed in loose deposits whenever groundwater depths are shallow or conditions are favorable for infiltration of precipitation through the zone of aeration. In the USSR, the role of small cycles decreases and the role of large cycles increases from north to south with the gradual increase in average depths to the groundwater surface in the same direction. There is no synchronous occurrence of long-term extremal groundwater-level values. (Josefson-USGS)

2G. Water in Soils

WATER RECHARGE IN A SOIL WITH SHRINKAGE CRACKS,
Hohenheim Univ., Stuttgart-Hohenheim (West Germany).
G. Blake, E. Schlichting, and U. Zimmermann.
Soil Science Socity of America Proceedings, Vol 37, No 5, p 669-672, September-October 1973. 4 fig, 2 tab, 8 ref.

Descriptors: *Infiltration, *Recharge, *Soil water movement, Interstices, Tracers, Soil physical properties, Tritum, Expansive soils, Shrinkage, Permeability, Hydraulic conductivity.
Identifiers: *Shrinkage cracks.

Flow of water was studied in a relatively dry Pelosol characterized by fine shrinkage cracks between peds. The coefficient of linear expansion was 0.115 in peds of the Bva horizon between oven dryness and 0.3-bar moisture content. After a prolonged period in which evapotranspiration exceeded rainfall, 200 micro Ci of tritium were added with 100 liters of water to a plot 1.4 by 1.4 m. Replicated soil samples were taken after 24 hours and again 14 days later. Tritiated water was not confined to surface layers, about half being found below the 20-cm depth. Small amounts were found to the 100/cm sampling depth. Tritiated water did not wet the surface layers to the 0.3-bar percentage. Water additions of 765 mm applied to an adjoining plot over a period of 1 month showed gradual accumulation in the surface horizons of the profile rather than wetting to field capacity in layers that wet from the soil surface downward. These results are interpreted to indicate that water flowed down fine cracks in A and B horizons as free water, some of it soaking into the ped walls, or running into the C horizon. This was confirmed by measurements of the tritium concentration on

crack walls. It was significantly higher on ped surface in the Bva horizon than in soil taken from within the peds. (Knapp-USGS)

VERTICAL INFILTRATION INTO A LAYERED SOIL,
Connecticut Agricultural Experiment Station, New Haven. Dept. of Ecology.
D. E. Aylor, and J-V. Parlange.
Soil Science Society of America Proceedings, Vol 37, No 5, p 673-676, September-October 1973. 3 fig, 8 ref.

Descriptors: *Infiltration, *Unsaturated flow, *Soil horizons, *Equations, Anisotropy, Soil structure, Soil physical properties, Mathematical studies, Wetting, Saturated flow, Hydraulic conductivity.

An analytical model describes the soil moisture profiles for vertical infiltration into a layered soil (a fine textured layer over a coarser layer). For the case of constant imposed flux of water at the surface, the effect of an initial soil moisture content that increases with depth causes a steepening of the moisture profile; and the effect of the discontinuity in soil texture at the interface causes an accumulation of water above the interface in the fine textured soil. The technique is easy to apply and gives results which are in good agreement with experiment and substantially better than those obtained by computer simulation. (Knapp-USGS)
W74-00603

PROPAGATION OF SINUSOIDAL SOLUTE DENSITY OSCILLATIONS IN THE MOBILE AND STAGNANT PHASES OF A SOIL,
Wisconsin Univ., Madison. Dept. of Soil Science.
P. A. C. Raats.
Soil Science Society of America Proceedings, Vol 37, No 5, p 676-680, September-October 1973. 3 fig, 6 ref.

Descriptors: *Soil water movement, *Leaching, *Path of pollutants, *Soil structure, Absorption, Ion exchange, Equations, Pores, Solutes, Translocation, Ion transport.

The propagation of a sinusoidal solute density oscillation in soil water movement is analyzed in terms of its absorption coefficient, phase shift factor, and speed. In order to account for the structure of a soil, a solute may be considered to be divided between a mobile phase and stagnant phase. The mobile phase may correspond to the solution in a system of large pores and is assumed to move at a uniform, constant velocity in a certain direction. The stagnant phase may correspond to the solution in a system of small pores. The distribution and exchange of solute between the mobile and stagnant phases in assumed to be described by the ratio of the capabilities of the two phases to store solute and finite response time. The model shows clearly that the solute tends to bypass the stagnant phase. The results suggest several methods for measuring the parameters describing the interaction between the soil and the solute, and are of interest with regard to leaching of fertilizers and organic chemicals applied at the soil surface. (Knapp-USGS)

UNSTABLE WETTING FRONTS IN UNIFORM AND NONUNIFORM SOILS,
Wisconsin Univ., Madison. Dept. of Soil Science.
P. A. C. Raats.
Soil Science Society of America Proceedings, Vol 37, No 5, p 681-685, September-October 1973. 1 fig, 18 ref.

Descriptors: *Infiltration, *Wetting, *Soil water movement, Unsaturated flow, Anisotropy, Soil horizons, Hydraulic conductivity, Soil physical properties, Equations.

If the velocity of a plane wetting front increases with depth of penetration, then the front will be unstable, and a small perturbation of an initially plant front will tend to grow. On the basis of a simple hydraulic model due to Green and Ampt, criteria for instability were derived. Decreases of depth of ponding and of capillary pressure head at the wetting front, increaes with depth of the hydraulic conductivity and the initial water content, and compression of soil air ahead of the wetting front all have the effect of enhancing instability of the wetting front. The capillary pressure head at the wetting front is proportional to the surface tension and the cosine of the angle of contact of the water-air-soil interface and inversely proportional to the radius of curvature of the air-water interface, which in turn is proportional to the mean size of the soil particles. The analysis is extended to nonuniform soils. Criteria for instability of flows in layered soils and soils with crusts are included as special cases. (Knapp-USGS)

EFFECTIVE AVAILABLE WATER AND ITS RELATION TO EVAPOTRANSPIRATION RATE, DEPTH OF WETTING, AND SOIL TEXTURE,
Agricultural Research Service, Prosser, Wash.
D. E. Miller, and J. S. Aarstad.
Soil Science Society of America Proceedings, Vol 37, No 5, p 763-766, September-October 1973. 6 fig, 3 tab, 6 ref.

Descriptors: *Soil moisture, *Available water, *Evapotranspiration, Field capacity, Moisture content, Drainage, Irrigation.

The effect of evapotranspiration (Et) rate on effective available water (EAW) was evaluated for three soils ranging in texture from sand to silt loam, at evapotranspiration rates of about 0.4 to 1.3 cm per day, and at two depths of wetting. In all cases, as evapotranspiration rate increased, drainage following irrigation decreased and as a result EAW increased. The increase in EAW due to Et rate was relatively greater in the sand than in the finer textured soils. If only midsummer Et rates are considered, EAW may be estimated quite well from a field capacity test, provided soil depth and soil texture are considered in determining the sampling time for characterizing field capacity. If usable water is referenced to some safe depletion level rather than to the 15-bar percentage, the effect of Et is more important. EAW is influenced differently by depth of wetting in different textured soils. (Knapp-USGS)

EFFECT OF FOREST COVER REMOVAL ON DEPTH OF SOIL FREEZING AND OVERLAND FLOW,
Forest Service (USDA), La Crosse, Wisc. Watershed Lab.
R. S. Sartz.
Soil Science Society of America Proceedings, Vol 37, No 5, p 774-777, September-October 1973. 4 fig, 4 tab, 9 ref.

Descriptors: *Frost, *Overland flow, *Infiltration, *Clear-cutting, Water yield improvement, Forest management, Rainfall-runoff relationships, Vegetation effects, Watershed management, *Wisconsin.

Depth of soil freezing and overland flow were measured under four hardwood forest conditions in southwestern Wisconsin: woody vegetation cut and removed; all vegetation cut and removed; uncut forest with litter removed; and undisturbed forest. Removing only the litter and removing all the vegetation increased both soil freezing depth and overland flow. Removing only the woody vegetation decreased both. Frost depth means, in a year of deep frost, were 6 and 11 cm on the woody vegetation removed and undisturbed plots, and 19 and 35 cm on the all vegetation-removed and liter-removed plots. Overland flow values ranged from less than 1 cm on the woody vegetation-removed plots to more than 7 cm on the all vegetation-removed and litter-removed plots. The increases in frost depth and overland flow appeared to be related to changes in soil bulk density and porosity. (Knapp-USGS)

ANION EXCLUSION AND COUPLING EFFECTS IN NONSTEADY TRANSPORT THROUGH UNSATURATED SOILS: I. THEORY,
Volcani Inst. of Agricultural Research, Bet-Dagan (Israel). Dept. of Soil Physics.
E. Bresler.
Soil Science Society of America Proceedings, Vol 37, No 5, p 663-669, September-October 1973. 4 fig, 1 tab, 22 ref.

Descriptors: *Dispersion, *Soil water movement, *Ion exchange, *Osmosis, *Ion transport, Mathematical models, Numerical analysis, Clays, Simulation analysis, Unsaturated flow, Adsorption.

A simulation model for the simultaneous transport of anions and water takes into account physicochemical interaction between the solutes and the soil matrix. The effects of convection, ionic diffusion, mechanical dispersion, anion exclusion (negative adsorption), and coupling phenomena are considered jointly. The dependence of the osmotic efficiency coefficient and anion exclusion of soil water content and solution concentration are estimated from diffuse double-layer theory and hydrodynamic considerations. These estimates compare favorably with available data on clays and soils. The nonsteady flow equations are solved by a numerical approach that eliminates numerical dispersion. An infiltration experiment was characterized by relatively high water contents and rapid flow; this showed that osmotic gradients are of minor importance. A slight anion exclusion brought about some improvement in the comparison between the theoretical data. (Knapp-USGS)

Vodnyye Resursy, No 1, p 76-94, 1973. 39 ref.

Descriptors: *Soil physics, *Soil water, *Soil water movement, *Soil-water-plant relationships, *Evapotranspiration, Infiltration, Unsaturated flow, Porosity, Porous media, Model studies, Equations.
Identifiers: USSR, Water exchange.

Concepts and present state of knowledge of the physics of soil water are examined. Basic problems of investigations are movement of water in unsaturated porous media, and total evaporation and its components (transpiration of plants and evaporation from the soil). Ways of solving these problems are discussed, and individual applications of research results that show promise in the immediate years ahead are considered. (Josefson-USGS)

AN EQUATION FOR DESCRIBING WATER VAPOR ADSORPTION ISOTHERMS OF SOILS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
D. H. Fink, and R. D. Jackson.
Soil Science, Vol 116, No 4, p 256-261, October 1973. 2 fig, 1 tab, 22 ref.

Descriptors: *Adsorption, *Water vapor, Soil moisture, Soil water movement, Diffusion, Equations, Isotherms.

An adsorption isotherm equation describes sigmoidal Type II adsorption isotherms such as the adsorption of water on soils and clays. The equation was statistically evaluated on 52 published adsorption isotherms; 49 of the 52 had correlation coefficients greater than 0.99, and the lowest was 0.96. The equation also can predict the complete isotherm from only a few scattered data points. Other uses include differentiation of the isotherm as is needed in vapor diffusion studies, and integration of the isotherm as is needed in certain thermodynamic relationships associated with the adsorption of vapors on soil surfaces. MOVEMENT OF SALT AND WATER IN RELATIVELY DRY SOILS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Environmental Mechanics.
J-Y. Parlange.
Soil Science, Vol 116, No 4, p 249-255, October 1973. 4 fig, 9 ref.

Descriptors: *Soil water movement, *Solutes, *Diffusion, *Salts, Fertilizers, Path of pollutants, Osmosis, Mass transfer, Soil moisture.

When the surface of a relatively dry soil is covered with salt crystals, a wet layer containing salt in solution grows under the crystals. The water in the wet layer has little movement and salt diffuses into it from the surface. Water and salt concentration vary almost discontinuously between the wet layer and the drier soil underneath. These discontinuities are maintained by a strong osmotic potential which affects water movement in the vapor phase. (Knapp-USGS)

SOME COMPARISONS IN THE THERMAL STRUCTURE OF LAKES WOOD, KALAMALKA, OKANAGAN, SKAHA, AND OSOYOOS, BRITISH COLUMBIA,
Departmet of the Environment, Burlington (Ontario). Centre for Inland Waters.
J. O. Blanton.
Journal of the Fisheries Research Board of Canada, Vol 30, No 7, p 917-925, July 1973. 6 fig, 5 tab, 8 ref.

Descriptors: *Lakes, *Canada, *Epilimnion, *Hypolimnion, *Heat transfer, *Thermocline, *Thermal capacity, *Seasonal, Thermal properties, Aquatic life, Fish, Influent streams, Inflow, Groundwater, Surface waters, Limnology, Aquatic environment, Freshwater, Hydrology.
Identifiers: Lake Wood (Canada), Lake Kalamalka (Canada), Lake Okanagan (Canada), Lake Skaha (Canada), Lake Osooyos (Canada).

The rate of change of heat contents in five British Columbian lakes was investigated, and the relative ability of each lake to transfer heat vertically to warm its hypolimnion was studied. Rates of hypolmnion heatup ranged from 0.06 C per month in Okanagan to 0.54 C per month in the north basin of Osoyoos. All lakes reached maximum static stability through the thermocline in late August, except for northern Osoyoos which reached its maximum somewhat earlier. Maximum heat contents ranged from 18,100 cal/sq cm in Wood Lake to 33,300 cal/sq cm in Lake Okanagan. Maximum heat content values were observed in late August in all lakes. A direct relationship was found between the hypolimnetic warming rates and the maximum stability in the thermocline regions. However, the relatively low rate of Lake Wood implies an external cooling source, such as groundwater influx. The late summer increase in epilimnion volume in Lake Wood and the corresponding entrainment of nutrients from the hypolmnion to the epilimnion appear to control the amount of production observed at that time. (Brown-IPC)

HYDROCHEMICAL ZONALITY OF URAL LAKES (GIDROKHIMICHESKAYA ZONAL'NOST' OZER URALA),
M. N. Yeremeyeva, L. Ye. Chernyayeva, and A. M. Chernyayev.
Vodnyye Resursy, No 1, p 43-54, 1973. 1 fig, 9 tab, 2 ref.

Descriptors: *Lakes, *Limnology, *Water chemistry, *Inorganic compounds, *Water types, Water quality, Water analysis, Correlation analysis, Maps.
Identifiers: USSR, *Ural area.

Data on chemical composition of lake waters in the Ural area are based on approximately 3,000 chemical analyses of water samples obtained from hydrochemical investigations of more than 700 different lakes in 1956-71. By degree of mineralization, Ural lakes are classified into 5 categories: (1) freshwater lakes with a total mineralization less than 0.5 g/liter; (2) freshwater lakes with a total mineralization between 0.5 and 1 g/liter; (3) brackish-water lakes with a total mineralization between 1 and 5 g/liter; (4) saline lakes with a total mineralization between 5 and 35 g/liter; and (5) brine lakes with a total mineralization greater than 35 g/liter. Six hydrochemical lake zones are identified in the Ural area and adjoining regions: (1) zone of bicarbonate freshwater; (2) zone of bicarbonate-chloride freshwater and, occasionally, brackish water; (3) zone of chloride-bicarbonate brackish water; (4) zone of chloride-sulfate saline water; (5) zone of chloride saline and brine waters; and (6) zone of waters of varied chemical composition and mineralization. Hydrochemical zonality of lakes in the area is mapped, and parameters of lognormal distribution of Ca, Mg, Na+K, HCO3, SO4, and Cl concentrations in lake waters of different zones are tabulated. (Josefson-USGS)

ROTIFERS OF THE NEAR BOTTOM ZONE OF LAKES MIKOLAJSKIE AND TAITOWISKO,
Institute of Public Utility Services, Warsaw (Poland). Lab. of Hydrobiology.
H. Klimowicz.
Pol Arch Hydrobiol. Vol 19, No 2, p 167-178, 1972. Illus.
Identifiers: *Bottom zones (Lakes), Lakes, *Poland (Lakes Mikolajskie-Taitowsko), *Rotifers.

Evidence is supplied that near the lake bottom the benthic rotifers species are autochthonous, whereas eurytopic and planktonic ones immigrate from other lake zones chiefly from epilimnion. During the warm season the quantitative and qualitative species composition of rotifers over lake bottom is affected mainly by eurytopic and planktonic species. The number of benthic did not considerably change during the study period. The number of species and abundance of individuals in the near-to-bottom zone decreased with increasing depth.--Copyright 1973, Biological Abstracts, Inc.

DISTRIBUTION OF MONODACNA COLORATA (EULAMELLIBRANCHIATA, CARDIIDAE) IN THE SAMARSKY BAY OF THE ZAPOROZHSKY WATER RESERVOIR (IN RUSSIAN),
Dnepropetrovskii Gosudarstvennyi Universitet (USSR). Institut Gidrobiologii.
Yu. K. Gaidash, and I. P. Lubyanov.
Zool Zh, Vol 51, No 9, p 1402-1404, 1972, English summary.
Identifiers: Bays, *Cardiidae (Distribution), Eulamellibranchiata, *Monodacna-colorata, Reservoirs, Samarsky Bay (USSR), *Zaporozhsky Reservoir (USSR).

After the introduction of Monodacna, its development proceeded very slowly for almost 10 yr. A rather wide distribution of Monodacna in the Samarsky Bay of the Zaporozhsky Water Reservoir (USSR) was determined by a recently arisen favorable hydrochemical regime, optimal depths with oozed grounds, and abundance of food, detritus and phytoplankton. In 1971 the numbers of adult specimens amounted to 120/x m2 with the biomass of 782 g/m2 off the right bay coast and somewhat less off the left coast. In the bay Monodacna occurs within the mass of Dreissena (22,460-31,920 specimens/m2); together they serve as a habitat for amphipods. Monodacna rapidly became an important component of the ration of commercial fishes-benthophages and its mass development will, undoubtedly, contribute to an increase of fish productivity of the water body.--Copyright 1973, Biological Abstracts, Inc.

ECOLOGICAL DATA OF MIRE VEGETATION, (IN RUSSIAN),
Akademiya Nauk SSSR, Petrozavodsk. Inst. of Biology.
N. A. Belousova.
Ekologiya. Vol 3, No 4, p: 90-93, 1972, Illus.
Identifiers: Climates, *Ecological data, Geomorphology, *Mire vegatation, Nutrients, *Trophic stages, Vegetation, Acidity.

An ecological study of the mire vegetation was conducted during June-Aug. 1968-1970. The area contains 20-60% mire which results in a high climatic coefficient and geomorphological features. The water is hard (0.28-0.48 mg-ekv) and of low mineral content (less than 50 mg/1). This accounts for a low nutritional value of the mire, and thus a large number of mires are in the mesothrophic or oligothrophic stage of development. An increase in substrate acidity causes a corresponding decrease in a quantity of plant species and vice versa.--Copyright 1973, Biological Abstracts, Inc.

SEDGE ASSOCIATIONS FROM THE OZUNCA SWAMP, (IN RUMANIAN),
Brasov Univ. (Rumania).
M. Danciu.
Stud Cercet Biol Ser Bot. Vol 24, No 2, p: 83-94. 1972, Illus.
Identifiers: Acidity, Minerals, Peaty soils, *Romania (Ozunca swamp), *Sedge associations, Soils, *Swamps, *Caricetum species.

Sedge associations (3) from a peat containing marsh supplied with mineral water from the Baraolt mountains, Romania, are analyzed. The Caricetum diandrae Jon. 1932, found only in a small area (0.25 ha) on peaty soil of pH 6.4, is marked by the lack of many species characteristic of the order and association. The Caricetum caespitosae Klika et Smarda 1941 is located on the edge of the moor. Caricetum rostratae Ruebel is represented in 2 phytocenoses on large deposits of acid peat (pH 6.3).--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF FISH ON THE BOTTOM OF RESERVOIRS,
Y. Eren, A. Yashouv, and Y. Langer.
Bamidgeh. Vol 24, No 2, p: 40-48, 1972, Illus.
Identifiers: Bottom sediments, Fish, *Israel, *Oscillatoria-Chalybea, *Reservoirs, Salmon, *Tilapia-Aurea, *Cyanphyta.

Tilapia aurea affected the composition of bottom sediments in the experimental pond. In sections with fish the sediments contained 35% less organic matter. It is suggested that both feeding habits and the mechanical activity of the fish caused this change. Presence of fish affected the composition of benthic algae. More filamentous blue-green algae developed in sections without fish. The fish caused a significant decrease in the amount of submerged vegetation. There was no significant difference in the quantity and composition of bottom animals or in the amount of benthic algae between the treated and control areas. The results from the experimental pond verify the theory that the fish in the Tsalmon and Beth Netufa (Israel) reservoirs are involved in the reduction of taste and odor caused by the blue-green alga Oscillatoria chalybea.--Copyright 1973, Biological Abstracts, Inc.

NEMATODA, ACANTHOCEPHALA AND HIRUDINEA IN FISHES FROM THE RIVER HRON (CZECHOSLOVAKIA), (IN CZECH),
Slovenska Akademie Vied, Kosice (Czechoslovakia). Helmintologicky Ustav.
R. Zitnan.
Stud Helminthol, 2, p 21-32, 1968, Illus, English summary.
Identifiers: *Acanthocephala, Cottus-gobio, Cottus-poecilopus, *Czechoslovakia (River Hron), Fishes, *Hirudinea, Metabronema-truttae, *Ne-

matoda, Neoechinorhynchus-rutili, Pike, Piscicola-geometra, Pomphorhynchus-laevis, Pseudoechinorhynchus-clavula, Raphioascaris-acus, Rivers, Salmonidae.

Fishes (851) belonging to 47 species were examined. Of these fishes 115 (13.51%) were infested with nematodes, 290 (34.07%) with acanthocephala and 13 (1.52%) with hirudinea. From the epizootiological point of view Raphidascaris acus and Metabronema truttae are of particular importance being dangerous mainly for pikes and salmonidae. Particular attention should be given to the acanthocephala which have a characteristic ability to parasitize in a wide range of hosts and which belong to the most pathogenous fish helminths. Pomphorhynchus laevis found in 37 fish species coming from 12 localities, Neoechinorhynchus rutili found in 14 fish species from 3 localities and Pseudochinorhynchus clavula found in 7 fish species from 6 localities present the widest ecological variance. At the upper flow of the river Hron P. clavula appears to be important in the salmonidae; it is carried and distributed mainly by Cottus gobio and C. poecilopus both of which are an essential food element of larger trouts. Of the 2 hirudinea found Piscicola geometra is the most important and the most widely distributed. The majority of both economically important and unimportant fishes of the river Hron present helminth hosts of epizootiological importance even for fishes bred on fish farms of the Hron river basin.--Copyright 1973, Biological Abstracts, Inc.

POPULATION DYNAMICS OF HERBACEOUS COMMUNITIES OF PILANI (RAJASTHAN),
S. S. Coll., Alipur (India). Dept. of Botany.
V. R. Babu.
Jap J Ecol. Vol 21, No 3/4, p 87-95. 1971. Illus.
Identifiers: *Borreria-Articularis, Cenchrus-Biflorus, *Herbaceous communities, *India (Rajasthan), Population (Plants), Sandy, Soils, Weeds, Hydrogen ion concentration.

Population dynamic of herbaceous communities of certain areas around Pilani (India) were studied during the 1 growth season (monsoon) of 1968. The analysis of habitat factors and interrelationships between the habitat factors and the Borreria articularis population were also studied. Among about 10 herbaceous associates in various localities, B. articularis and Cenchrus biflorus are closely associated. An increase in the associates of the grass group reduced the B. articularis populations. In cultivated fields, the ratio between weeds and the crop plants is found to be 7:1. Of the 7 weeds for every crop plant, 3 are B. articularis. The population of B. articularis is limited by the fine sand content. The plants' preference for sandy soils with pH near neutral is established. Populations showed negative logarithmic relationship with soil pH from 7.3 to 7.7.--Copyright 1973, Biological Abstracts, Inc.

XYLEM WATER POTENTIALS AND STOMATAL RESISTANCE IN BOG PLANTS: ECOLOGICAL IMPLICATIONS,
New Hampshire Univ., Durham. Dept. of Botany.
P. J. Marchand.
Center for Northern Studies, Wolcott, Vermont, Contribution No 1, (1972). 18 p, 1 fig, 4 tab, 10 ref. OWRR A-031-NH (2).

Descriptors: *Plant morphology, *Water storage, *Transpiration, *Xylem, *Stomata, Bogs, Vegetation, Wetlands, Soil water, *New Hampshire, Blueberries, Maple trees, Birch trees, Vermont, Tamarack, Moisture uptake, Evaporation.
Identifiers: *Durham (NH), *Plant water potential, Leatherleaf, Maleberry, Black chokeberry, Black alder, Red maple, Sheep laurel, Low-bush blueberry, Paper birch, Labrador tea, Wolcott (Vt.).

Both stomatal resistance to the diffusion of water vapor and xylem water potential of several vegetation species in a bog were measured. Comparison was made of differences in plant water potential within the bog, between a bog and an upland community, and between different habitats of a single species. Air temperature, relative humidity, evaporation, and soil water content (with soil type) were measured. To determine amount of variation of stomatal resistance within bog community, a three-way model analysis of variance was used to test independently, stomatal resistance values on leaves, individuals, species, and days. Within one bog, xylem water potentia.s ranged from early morning high of between -1.7 and -4.0 bars for all species, to a low exceeding -22 bars for individuals of Acer rubrum, Ilex verticillata, and Lyonia ligustrina. Ledum groenlandicum in its upland habitat showed higher water potential levels than its counterpart in a boreal swamp. Whatever the internal resistance source, obviously the concomitant low xylem water potentials are bog characteristics. What was observed, is simply a range of plant water potentials reflecting potential gradient necessary to overcome flow resistance presumably imposed by some environmental factor other than soil-water status. (Jones-Wisconsin)

THE RESPONSES TO CURRENT FLOW OF TWO STREAM DWELLING TRICLADS, CRENOBIA ALPINA (DANA) AND POLYCELIS FELINA (DALYELL),
Waterloo Univ. (Ontario). Dept. of Biology.
M. A. Lock.
Oecologia (Berl). Vol 10, No 4, p 313-320. 1972. Illus.
Identifiers: Apparatus, *Crenobia-Alpina, Flow, *Polycelis-Felina, Stream, *Triclads.

An apparatus is described which allows triclads to choose between the fast and slow regions of a stirred tank. In the absence of a stone substratum C. alpina preferred or tolerated higher current speeds than P. felina, this effect was enhanced when a stone substratum was added to the apparatus. These results indicate that the absence of P. felina from the steep gradient regions of streams could be accounted for by its preference for slower micro-currents. Conversely the presence of C. alpina in steep gradient regions could be accounted for by its preference for or tolerance to higher micro-currents.--Copyright 1973, Biological Abstracts, Inc.

NATURAL FACTORS OF ACTIVATION OF PLAGUE EPIZOOTIAE IN SIBERIA, (IN RUSSIAN),
G. S. O. Letov.
Zool Zh. Vol 51, No 7, p 1041-1047. 1972. Illus. (English summary).
Identifiers: *Epizootiae, Parasites, *Plague, *Sousliks, USSR (Siberia-Mongolia).

The zone of plague natural foci in Mongolia and South Siberia is located mainly in regions which did not suffer from Pleistocene glaciation. The formation of plague biocoenosis proceeded under the effect of sharply continental dry climate. During the dry spring season the course of Plague epizootiae among long-tailed Siberian and Daurian sousliks is not intensive. A sharp increase in the development of epizootiae coincides with the appearance of young animals going out of burrow during the season of maximal precipitation and resumption of plant vegetation. The optimum of life conditions for rodents and ectoparasites is prerequisite for activation of epizootiae.--Copyright 1973, Biological Abstracts, Inc.

PRIMARY PRODUCTION-PHYTOPLANKTON RELATIONSHIP IN THE CRAPINA-JIJILA COMPLEX IN THE FLOOD CONDITIONS OF 1970, (IN RUMANIAN),
Bucharest Univ. (Rumania). Faculty of Biology.
L. Gavrila, I. Chiosila, and A. Schneider.
Stud Cercet Biol Ser Bot. Vol 24, No 2, p: 141-157, 1972, Illus.
Identifiers: Basins, Floods, *Phyto plankton relationships, Pisciculture, Plankton, *Primary production, *Romania (Crapina-Jijila complex), Zooplankton.

Under the flood conditions of 1970, primary production was provided primarily by phytoplankton. This attests to the very advantageous nature of this primary production which joined the trophic flow of the basin at the very moment of its formation. It was immediately taken over by the secondary factors of the trophic chain. The piscicultural arrangement of the Jijila basin (Romania) has a positive influence on the development of the phytoplankton and, unlike the previous years when this basin was not protected against flood, results in an adequate primary plankton production. In determining the characteristic of the primary production, the phytoplankton-macrophytes-zooplankton relationship plays a very important role. The value of the primary plakton production is dependent upon the physiological condition of the photosynthesizing organisms and on the trophic group to which these belong.--Copyright 1973, Biological Abstracts, Inc.

PLANTATIONS OF CONIFEROUS TREE SPECIES, (IN RUSSIAN),
M. V. Strukov.
Sb Rab Po Lesn Khoz Mold Lesn Opytn Stn. 4 p 146-147. 1970.
Identifiers: *Coniferous treas, Oak, *Pinus-Nigra, Pinus-Nigra-Caramanica, Pinus-Sylvestric, Spruce, *Tree species, *USSR (Moldavia).

Investigations of 37-yr-old plantations in the Gerbovetskii Forest, USSR showed that pine and spruce can grow successfully in the southern steppe zone of Moldavia. The drought resistant Pinus nigra is more suitable to dry conditions, than P. sylvestris and spruce. P. nigra caramanica is similar to P. nigra in its biological characteristics. The productivity of coniferous tree species is 1.5 (site class) higher than that of oak under the same conditions. In establishing pine and oak plantations adequate spacing is important, dense planting may lead to the death of the stands.--Copyright 1973, Biological Abstracts, Inc.

THE VARIATION OF WATER RELATIONS AND RESPIRATION INTENSITY IN MALE AND FEMALE EPHEDRA DISTACHYA PLANTS OF THE BLACK SEA COAST AS A FUNCTION OF AGE,
Alexandru Ion Cuza Univ., Iasi (Rumania).
E. Jeanrenaud.
Rev Roum Biol Ser Bot. Vol 17, No 1, p 29-41, 1972. Illus.
Identifiers: Age, *Black Sea, Coasts, *Ephedra-Distachya, *Phenophase, *Respiration, Sea water.

Water relations in male and female E. distachya plants growing in the same biotope (dunes of the littoral) differed in the various phenophases. A direct correlation between the diurnal course of the intensity of respiration and of transpiration was found to exist in the females and males. The value of the intensity of respiration in male and female plants varied with the function that they accomplish in certain phenophases. In experimentally produced progressive dehydration of the tissues, the intensity of respiration varied both as a function of the phenophase and sex.--Copyright 1973, Biological Abstracts, Inc.

THE INFLUENCE OF METEOROLOGICAL ELEMENTS ON THE ANNUAL RHYTHM OF HEIGHT GROWTH IN PINES, (IN GERMAN),
Deutsche Akademie der Landwirtschaftswissenschaften zu Berlin, Eberswalde (East Germany). Institut fuer Forstwissenschaften.
R. Luetzke.
Flora (Jena). Vol 116, No 4, p 451-462, 1972. Illus. (English Summary).
Identifiers: *Annual, Growth, Height, *Meteorological conditions, Moisture, *Pines, Soils, Solar radiation, Temperature, Winds, Sands.

The measurements were performed in a pole wood on a sandy soil with deep groundwater. The deviations from the average trend of the annual height growth course were caused almost entirely by temperature. When the influence of temperature was eliminated, a relation between increment and global radiation, precipitation, soil-moisture, air humidity, potential evaporation and wind was not to be ascertained. There was a high coefficient of determination for the non-linear regression of time parameter and temperature upon current increment. The reasons for the strong influence of temperature on current height growth and for the lack of influence of the moisture parameters are discussed.--Copyright 1973, Biological Abstracts, Inc.
W74-01077

ON THE STELLARIO-ALNETUM GLUTINOSAE (MIKYSKA 1944) LOHMEYER 1957 IN THE CZECH SOCIALISTIC REPUBLIC (CSR),
Ceskoslovenska Akademie Ved, Prague. Biologicky Ustav.
Z. Neuhauslova-Novotna.
Folia Geobot Phytotaxon. Vol 7, No 3, p 269-284, 1972. Illus. (English summary).
Identifiers: *Alder, Alnetum-Glutinosae, *Ash, *Czechoslovakia, *Gley, Lamimum-Maculatum, Pulmonaria-obscura, Soils, Stellaria-holostea, Stellaria-nemorum, Water table.

This community is a typical Alnion glutinoso-incanae-forest in brook valleys of the colline and lower submontane situations. Stellario-Alnetum is characterized by the dominance of alder and ash in the tree layer and by the occurrence of the (hygro) mesophilous differential species of the association, Stellaria nemorum, S. holostea, Pulmonaria obscura and Lamimum maculatum in the herb layer. This community represents, from the ecological point of view, a periodically or episodically flooded alluvial forest on gley soils. According to the soil moisture and air regime 4 subassociations can be distinguished: Stellario-Alnetum crepidetosum paludosae with often wet to swampy soils, high groundwater table (typical Gley) and unfavorable air regime of the soils. S.-A. chrysosplenietosum on moisture to wet, but not swampy soils with high groundwater table (typical Gley) and well aerated soils, S.-A. allietosum ursini with fresh soils in the dry period with a high or low groundwater table (typical Gley, Braunerde-Gley) and the well aerated soils and the relatively dry S.-A. typicum with mostly low groundwater table (Braunerde-Gley) and very well aerated soils. The relations of Stellario-Alnetum to the allied Central-European alluvial communities as well as the geographical distribution of this association in Central-Europe are briefly discussed.--Copyright 1973, Biological Abstracts, Inc.

DEEPSOIL STUDIES OF OAK ROOT SYSTEMS IN OLD AGE PLANTATIONS, (IN RUSSIAN),
Yu. P. Kravchuk.
Sb Rab Po Lesn Khoz Mold Lesn Opytn Stn. 4, p 129-145, 1970.
Identifiers: *Oak root systems, Old plantations, Roots, *Soils, *USSR (Gervoetskii forest), Soil-water-plant relationships.

Digging out in the Gervoetskii Forest of root systems (RS) of oak 52 and 56 yr old to the full depth of their penetration into the ground (8 m) showed the presence of both surface roots (SR) and deep roots (DR). In the upper soil horizons there is a dense net of large and fine roots while in the deeper layers, there are slightly branching, threadlike, tap and vertical roots. The oak RS envelops a considerable volume of soil (165-200 m3) which improves moisture and nutrient uptake. In tree species with a tap RS, one should distinguish SR zones and DR zones. A major role in forest productivity is played by the upper part of the RS in humus horizons and the role of DR increases in importance during years with low moisture, by raising the resistance of oak to drought. One should not establish pure and excessively dense stands and the optimum structure of stands is: an upper story of oak, with a moderate number of stems, and a second story of shade-tolerant tree species.--Copyright 1973, Biological Abstracts, Inc.

2J. Erosion and Sedimentation

ACCUMULATION OF SEDIMENT IN THREE MISSISSIPPI RESERVOIRS,
Mississippi State Univ., State College. Water Resources Research Inst.
C. M. Hoskin.
Available from the National Technical Information Service as PB-224 838, $2.75 in paper copy, $1.45 in microfiche. Completion Report, July 1973. 15 p, 3 fig, 1 tab, 16 ref. OWRR A-061-MISS (1).

Descriptors: *Multiple-purpose reservoirs, *Sedimentation rates, *Mississippi, *Lake sediments, Cores.
Identifiers: *Phleger gravity cores, USM Lake (Miss), Lake Geiger (Miss), Lower Ross Barnett Reservoir (Miss).

Phleger gravity cores were collected from three small reservoirs in Mississippi - USM Lake (7 cores), Lake Geiger (12 cores) and Lower Ross Barnett Reservoir (11 cores). Striking contrasts in color and grainsize permitted differentiation of reservoir sediment (dark green, nearly sand-free) from older and now-inundated soil (red, yellow, brown or grey muddy sand) in these cores. Range and average thickness of reservoir-accumulated sediment for 12-year-old USM Lake, 30-year-old Lake Geiger, and 11-year-old Ross Barnett Reservoir were, respectively, 55 to 342 mm, X 137 mm; 35 to 210 mm, X 93 mm; and 5 to 347 mm, X 58 mm. Average annual rate of sediment accumulation in USM Lake, Lake Geiger, and Lower Ross Barnett Reservoir was calculated to be, respectively, 9 mm/year, 3 mm/year, and 2.6 mm/year. Contrary to expectations, no sedimentary layering was discernible in split cores of these reservoir sediments.

RATE AND MECHANISM OF NA-MONTMORILLONITE HYDROLYSIS IN SUSPENSIONS,
Volcani Inst. of Agricultural Research, Bet-Dagan (Isreal). Dept. of Soil and Water.
I. Shainberg.
Soil Science Society of America Proceedings, Vol 37, No 5, p 689-694, September-October 1973. 2 fig, 2 tab, 9 ref.

Descriptors: *Hydrolysis, *Montmorillonite, *Ion exchange, Hydrogen ion concentration, Sodium, Electrical conductance, Conductivity, Water chemistry.

The electrical conductivities of Na-montmorillonite suspensions were studied at various NaCl concentrations and two temperatures as a function of time. The conductivities of the suspensions increased with time, indicating that the suspensions were not stable. The rate of spontaneous decomposition increased with the clay concentration in the suspension and with the temperature. When the electrical conductivities were plotted against the square root of time, a straight line was obtained. These findings suggest that the mechanism of the reaction consists of two elementary consecutive reactions: the first is a rapid exchange reaction between adsorbed Na and H ions in solution and the second reaction is a first-order transformation of H-clay to Al-clay. POLAROGRAPHIC STUDY OF CALOMEL ELECTRODE IN ANHYDROUS FORMIC ACID,
Quebec Univ., Rimouski (Quebec). Dept. of Pure Sciences.
M. Arnac, and G. Verboom.
Analytical Chemistry, Vol 45, No 11, p 1954-1956, September 1973. 2 fig, 1 tab, 9 ref.

Descriptors: *Electrochemistry, Organic acids, Solubility, Aqueous solutions, Methodology.
Identifiers: *Formic acid, *Polarography, *Saturated calomel electrodes, *Dropping mercury electrode, Organic solvents, Calomel electrodes, Reference electrodes, Amperometric titration.

The formic acid analog of the saturated calomel electrode has been studied by polarography since the equivalent reference is commonly used in glacial acetic acid. Direct current polarograms of the mercury system were obtained for anhydrous formic acid solutions containing variable amounts of chloride. The working cell was equipped with a condenser unit, cooled by circulating ice water. Controlled current oxidation (10 mA) of a mercury coulometric electrode of large area introduced mercurous ions in the solution. The drop time of the capillary electrode was in the range of 4-5 seconds. Voltage scanning was 60 mV per minute. Solutions were all initially deaerated with oxygen-free nitrogen for 10 min. The temperature of the water thermostat used throughout this investigation was maintained at 25.0 plus or minus 0.5 C. Measurements were carried out in a nitrogen atmosphere. Polarographic maximums were eliminated by adding gelatin. The formic acid analog of the saturated calomel electrode fulfills the requirements of a reference system. To calculate the solubility product of calomel it should be necessary to know the complexation constant of mercurous ions with formate ions. This constant has not been determined; the electrochemical system studied proceeds irreversibly in a noncomplexant supporting electrolyte medium (potassium perchlorate). The value of pK and the solubility product constant of mercurous chloride in aqueous solution (ps sub aq equals 17.9) are in the same order of magnitude. Nevertheless calomel precipitation is more quentiative in anhydrous formic acid than in water. (Holoman-Battelle)

SPINNING DROPPING MERCURY ELECTRODE-A PRACTICAL ANALYTICAL TOOL,
Saint John's Univ., Jamaica, N. Y. Dept. of Chemistry.
H. J. Mortko, and R. E. Cover.
Analytical Chemistry, Vol 45, No 11, p 1983-1984, September 1973. 12 ref.

Descriptors: *Monitoring, *Aqueous solutions, *Polarographic analysis, Laboratory equipment, Continuous flow, *Electrodes.
Identifiers: Spinning dropping mercury electrode, Dropping mercury electrode, Limiting currents, Ion selective electrodes.

A spinning dropping mercury electrode (SDME) has been developed for continuous analysis of stirred or flowing systems. The SDME overcomes the difficulty of the vibration dropping mercury electrode (VDME); namely, mechanical complexity and the need for high mercury pressure. The SDME uses straight barometer-tubing capillaries of commercial size which are pointed downward and usable in small diameter streams. The capillary is rotated in a ball-bearing housing aroung its own axis at 0-7000 rpm. The rotating mercury reservoir is attached to the capillary with Tygon tubing. The results obtained with the SDME were similar to those with the VDME, and their polarograms were essentially identical. Optimal analytical response was obtained at the highest agitation rate. Limiting currents for Cd in KNO3, the effect of rotation on maxima and limiting currents, and the effect of drop time on adsorption inhibition are discussed. (Little-Battelle)
W74-00634

AN AMMONIUM ION-SPECIFIC ELECTRODE,
Gulf South Research Inst., New Oreleans, La. Dept. of Analytical Chemistry.
J. G. Montalvo, Jr.
Analytica Chemica Acta, Vol 65, No 1, p 189-197, June 1973. 3 fig, 1 tab, 4 ref.

Descriptors: *Ions, *Aqueous solutions, *Air environment, *Permselective membranes, Fabrication, Selectivity, Pollutant identification, Testing procedures, Hydrogen ion concentration, Chemical reactions, Ureas, Optimization, Sodium chloride, *Sodium, *Potassium.
Identifiers: *Ion selective electrodes, Ammonium, *Ammonium electrodes, Sensors, Ammonium chloride, Potassium chloride, Urease.

The complete lack of response of a gas-permeable membrane cationic electrode to potassium and sodium ion (at representative clinical levels) and the response to ammonium ion are illustrated by noting the response when the electrode is dipped into various solutions. An ammonium ion-specific electrode was prepared by coupling a hydrophobic ammonia-permeable membrane to a Beckman monovalent cation electrode. At physiological pH values the ratio of ammonia to ammonium ion is only 0.01, yet the gas-transport mechanism is still operable; an electrode designed on this principle was able to detect ammonium ion produced via the urea-urease reaction. The electrode can be operated in an air stream or in an aqueous medium. The electrode can also be used in an ultra-sensitive mode by pH stripping of ammonia from the test solution. (Holoman-Battelle)
W74-00636

ELECTROCHEMICAL STUDY OF A HETEROGENEOUS COPPER (II)-SELECTIVE ELECTRODE; STUDY OF SELECTIVITY AND POTENTIAL STABILITY,
Technical Univ. of Budapest (Hungary). Inst. for General and Analytical Chemistry.
J. Pick, K. Toth, and E. Pungor.
Analytica Chimica Acta, Vol 65, No 1, p 240-244, June 1973. 6 fig, 4 ref.

Descriptors: *Selectivity, *Copper, Aqueous solutions, *Heavy metals, Water analysis, Stability, *Ions.
Identifiers: *Ion selective electrodes, *Membrane electrodes, Life time, *Potential stability, Chemical interference, Pretreatment, Electrode potential.

The lifetime of the copper (II)-selective membrane electrode was studied for three conditions: (1) in the first period of pretreatment in a reducing medium; (2) in prolonged use; and (3) on soaking the electrode in 1 M copper (II) sulfate. The results showed that the electrode responds to Cu (II) without pretreatment, but pretreating in reducing medium such as ascorbic acid is necessary to obtain reproducible results. Electrode response decayed only after 3 months. Soaking in copper sulfate reduced lifetime to 3 weeks, but the effect was reversible by treatment in a reducing medium. Selectivity tests were conducted with solutions containing Pb, Cd, Zn, Co, Ni, Mn, Ag, Hg, and Bi ions. The first six ions did not adversely affect electrode response; however, metal cations such as Ag, Hg, and Bi which form less soluble sulfide precipitates than copper sulfide interfered with the electrode function. (Little-Battelle)

POLYMER MEMBRANE ELECTRODES. PART I. A CHOLINE ESTER-SELECTIVE ELECTRODE,
Corning Glass Works, N. Y. Research and Development Lab,.
G. Baum, M. Lynn, and F. B. Ward.
Analytica Chemica Acta, Vol 65, No 2, p 385-391, July 1973. 2 fig, 4 tab, 9 ref.

Descriptors: Fabrication, *Permselective membranes, Hydrolysis, Biochemistry, Chemical reactions, Electrochemistry, Selectivity, Cations, *Electrodes.
Identifiers: *Ion selective electrodes, *Polymer membrane electrodes, Choline ester electrodes, *Enzyme activity, Performance evaluation, Sensors, Acetycholinesterase, Acetycholine, Polyvinyl chloride membranes, Liquid membrane electrodes, Choline, Acetyl-beta-methylcholine, Butyrylcholine.

An electroactive polyvinylchloride membrane can be prepared which has a Nernstain response towards choline and choline esters. The membrane is prepared from a solution of acetylcholine tetra-p-chlorophenylborate in a phthalate ester which serves as the plasticizer for PVC. The membrane electrode can be used for the kinetic assay of acetylcholine esterase activity. A rate equation is derived which describes the response of the electrode towards simultaneous substrate disappearance and product formation during the en-

zyme-catalyzed hydrolysis of acetylcholine. The performance of the polymer membrane electrode is markedly superior to the liquid-membrane electrode. The polymer membrane electrode has a very short recovery time between assays (1-3 min) and the start-up after an overnight storage is only about 10 min. The results obtained with the polymer membrane electrode exhibit significantly less scatter than the results obtained with the liquid-membrane electrodes. (See also W74-00648) (Holoman-Battelle)

POLYMER MEMBRANE ELECTRODES. PART II. A POTASSIUM ION-SELECTIVE MEMBRANE ELECTRODE,
Corning Glass Works, N. Y. Research and Development Lab.
G. Baum, and M. Lynn.
Analytica Chimica Acta, Vol 65, No 2, p 393-403, July 1973. 7 fig, 3 tab, 16 ref.

Descriptors: Semipermeable membranes, *Permeability, Fabrication, Selectivity, Permselective membranes, Chemical properties, Physical properties, Electrochemistry, Electrolytes, Electrodes.
Identifiers: *Polymer membrane electrodes, *Potassium electrodes, *Plasticizers, Chemical composition, Phthalate esters, Membrane electrodes, Ion selective electrodes, Dibutylphthalate, Liquid membrane electrodes, Dioctylphthalate, Di-i-nonylphthalate, Diethoxyethylphthalate, Tri (2-ethylhexyl) phosphate, Tricresylphosphate, Phenyldioctylphosphonate, m-Nitrodiphenyl ether, 3-o-Nitroxylene, p-Hexylnitrobenzene, p-Nitrophenyloctyl ether, o-Nitrophenylbutyl ether.

An ion-selective plasticized polymer membrane electrode of the ion-exchange type is described for potassium. The chemical nature of the plasticizer has a dominant influence on the slectivity of the electrode towards univalant cations. The selectivity ratio was examined over an extended time interval as a function of membrane thickness and plasticizer content. A simplified procedure for the determination of the selectivity ratio of the electrode in mixed electrolyte solutions is proposed and compared with several of the methods which have been described in the literature. ADSORPTIVE EXTRACTION FOR ANALYSIS OF COPPER IN SEAWATER,
Woods Hole Oceanographic Institution, Mass.
W. B. Kerfoot, and R. F. Vaccaro.
Limnology and Oceanography, Vol 18, No 4, p 689-693, July 1973. 4 fig, 13 ref. NSF Grant GB-33479 and GI-32140.

Descriptors: *Activated carbon, *Copper, *Water analysis, Trace elements, Water chemistry, Chemical analysis, Adsorption.

Activated carbon can remove trace amounts of complexed and ionic copper from water. Just 10 mg of finely divided carbon is sufficient to concentrate copper from seawater to 700 times its natural level. When the copper is eluted with acid and analyzed by atomic absorption, the results compare well with organic extraction methods now in use, although the accuracy is somewhat reduced. (Knapp-USGS)

DISTRIBUTION OF TRACE METALS IN THE PORE WATERS OF SHALLOW WATER MARINE SEDIMENTS,
Edinburgh Univ. (Scotland). Grant Inst. of Geology.
P. Duchart, S. E. Calvert, and N. B. Price.
Limnology and Oceanography, Vol 18, No 4, p 605-610, July 1973. 1 fig, 2 tab, 23 ref.

Descriptors: *Trace elements, *Pore water, *Bottom sediments, *Sea water, Manganese, Iron, Copper, Nickel, Zinc, Cobalt, Lead.
Identifiers: *Scotland (Lock Fyne).

The concentrations of seven trace metals in the pore waters of marine sediments from Loch Fyne, Scotland, were analyzed by atomic absorption spectrophotometry following solvent extraction. The samples were taken from sediments containing variable amounts of sulfide at depth and variable thicknesses of oxides at the surfaces; one core contains abundant manganese nodules and manganese-calcium carbonate concretions. The distribution of dissolved Mn shows a regular downward decrease in all cores; this is interpreted as an indication of recycling of Mn between solid diagenetic mineral phases and pore solutions. Dissolved Fe, in much lower concentrations, either decreases or increases down the core depending on the type of sediment; Cu, Ni, Zn, Co, and Pb also show variable concentration profiles indicating control by different postdepositional reactions in the sediment, which in turn depend on different physiochemical environments generated by variable amounts of contained organic material and different accumulation rates. (Knapp-USGS)

SEASONAL VARIATIONS OF CADMIUM, COPPER, MANGANESE, LEAD, AND ZINC IN WATER AND PHYTOPLANKTON IN MONTEREY BAY, CALIFORNIA,
Stanford Univ., Pacific Grove, Calif. Hopkins Marine Station.
G. A. Knauer, and J. H. Martin.
Limnology and Oceanography, Vol 18, No 4, p 597-604, July 1973. 3 fig, 3 tab, 20 ref.

Descriptors: *Water chemistry, *Cadmium, *Copper, *Manganese, Seasonal, Lead, Zinc, Plankton, *California, Sampling.
Identifiers: *Monterey Bay (Calif).

Surface water and mixed phytoplankton samples, collected over 1 year in Monterey Bay, California, were analyzed for Cd, Cu, Mn, Pb, and Zn. The phytoplankton appeared to have little effect on the concentrations of these elements in water with the exception of Cd, which decreased during peak periods of productivity. Generally, metal levels in nearshore surface waters appeared to be more dependent on hydrographical fluctuations than on biological factors. Surface water collected on a transect between Hawaii and Monterey was analyzed for these same trace metals, for inshore-offshore comparisons. Levels of Cu, Mn, and Zn were usually higher inshore than offshore esecially during periods of strong upwelling. Concentrations of Cd and Pb were almost always an order of magnitude higher inshore. (Knapp-USGS)
W74-00829

CHANGES IN THE CONCENTRATION OF SOLUBLE AND PARTICULATE IRON IN SEA-WATER ENCLOSED IN CONTAINERS,
Washington Univ., Seattle. Dept. of Oceanography.
J. Lewin, and C. Chen.
Limnology and Oceanography, Vol 18, No 4, p 590-596, July 1973. 4 fig, 3 tab, 10 ref. NSF Grant GA-27498.

Descriptors: *Water chemistry, *Sea water, *Iron, *Chelation, Chemical reactions, Chemical precipitation, *Washington.
Identifiers: *Puget Sound (Wash).

Seawater samples collected along the Washington coast (Puget Sound) were used as sources of naturally occurring iron fractions. Once the water was enclosed in a container, approximately half of the iron in the soluble fraction disappeared and could be quantitatively accounted for by an increase in the iron of the particulate fraction; when the particulate fraction was removed at zero time, soluble iron likewise disappeared, but most of it went onto the walls of the container. The changes were independent of temperature and soluble iron disappeared even when the particulate fraction (including organisms) was removed at zero time, ruling out biological activity. These changes were completed in 30-40 hr. Part of the soluble fraction was ferrous iron. Addition of Na2-EDTA stabilized a portion of the soluble iron equivalent to the ferrous content and kept it from disappearing during the experiment. Ferrous iron may be present in a chelated form in the natural seawater. (Knapp-USGS)

WATER QUALITY ASSESSMENT PRACTICE IN AUSTRALIA,
Melbourne Water Science Inst. (Australia).
B. J. Lyons, and C. D. Parker.
Australian Water Resources Council Technical Paper No. 4, 1973. 60 p, 18 tab, 93 ref.

Descriptors: *Water analysis, *Chemical analysis, *Water quality, *Analytical techniques, *Australia, Appraisals, Evaluation, Programs, Projects, Surface waters, Groundwater, Laboratory tests, Research and development, Sampling, Monitoring, Networks, Census, Statistics, Documentation.

Details are presented of the findings of a research project, Detection, Identification and Measurement of Water Quality Characteristics, which was supported by the Water Research Fund of the Australian Water Resources Council. The primary aim of the project was to provide a comprehensive review of current Australian practice for use in the work of the Council's Technical Committee on Water Quality and to identify research needs. The project findings will be of value to a wide range of operational and research bodies concerned with the assessment and management of water resources. The findings are presented in tables and discussed in the text. Documentation of monitoring programs, laboratory procedures for physical, chemical, and biological characteristics is presented. The survey has shown that there exists an extensive field of expertise in this field in Australian laboratories. Apart from the areas indicated, practice in Australian laboratories is based on full appreciation of overseas knowledge. Consideration was also given to research and development both in Australia and overseas on sampling and monitoring procedures and methods used to identify and measure characteristics. (Woodard-USGS)

CHESAPEAKE BAY EXISTING CONDITIONS REPORT, APPENDIX A--THE PEOPLE AND THE ECONOMY.
Corps of Engineers, Baltimore, Md.

1973. 230 P.

Descriptors: *Chesapeake Bay, *Water resources development, *Human population, *Economics, Reviews, Projections, Evaluation, Industries, Agriculture, Urbanization, Construction, Mining, Public utilities.

Appendix A of the Chesapeake Bay Existing Conditions Report contains 6 chapters: (1) Introduction, (2) Economic History, (3) Population Characteristics, (4) Economic Sectors, (5) Economic and Demographic Projections, and (6) Summary. The economic history of the Chesapeake Bay Region contains elements which point toward the future. Height, width, and breadth are combined with time and change to achieve meaning. The chapter on population characteristics is limited to historic and recent demographic trends, and the age and educational levels of the population. The second half of this chapter lists current employment and income figures in the Bay Region. The chapter concerned with economic sectors includes an analysis of the manufacturing, public administration, agriculture, construction, mining, wholesale and retail trade, armed forces, transportation, communications, utilities, services, finance, insurance, and real estate industries. All these sectors are disaggregated, where appropriate, into various components. The chapter on economic and demographic projections includes a program of economic measurement conducted by the Bureau of Economic Analysis and the Economic Research Service. Projection methodology is the main thrust of this section. (See also W74-00888 thru W74-00891 and W74-00924) (Woodard-USGS)
W74-00887

CHESAPEAKE BAY EXISTING CONDITIONS REPORT, APPENDIX B, THE LAND--RESOURCES AND USE, VOLUME I.
Corps of Engineers, Baltimore, Md.

1973, 215 P.

Descriptors: *Chesapeake Bay, *Water resources development, *Land resources, *Land use, Geology, Mineralogy, Soil types, Climatology, Hydrology, Surface waters, Groundwater resources, Aquifer characteristics, Sedimentation, Reviews.

Appendix B, Volume I, of the Chesapeake Bay Existing Conditions Report contains 9 chapters: (1) Introduction, (2) Geology of the Bay Region, (3) Mineral Resources of the Bay Region, (4) Soils of the Basin, (5) Land Use, (6) Climate, (7) Surface Water-Hydrology, (8) Ground Water Resources, and (9) Sedimentation. In developing an effective water-land management program, existing land resources must be carefully defined and understood. Consequently, all of the component elements of Appendix B are, in some way land-oriented. Such things as water quality and supply,

groundwater occurrence, runoff, and infiltration, among others, are affected by the nature of specific geologic elements. Geology has a major influence on the occurrence of mineral resources. Both the Piedmont and Coastal Plain Provinces within the Chesapeake Bay Region contain rich resources of economic importance. These mineral resources and their principal areas of location are analyzed. Soil cover is described as it directly affects such physical conditions as streamflow patterns, erosion, and amount and type of flood protection needed. The study area is broken down into major types of land use in order to analyze the present distribution of each. Data are presented on precipitation, temperature, winds, and evaporation as they influence the use made of both the Bay's land and water resources. The drainage basins and the flows of the major tributary rivers to the Bay include the extremes of flow, both floods and droughts, as well as monthly and yearly averages. Ground water and aquifer systems data show areal distribution, yield, and quality characteristics. Federal State, and local sedimentation controls are reviewed to determine their effectiveness, and to point out the need for continued efforts in this area. (See also W74-00887, W74-00889 thru W74-00891 and W74-00924) (Woodard-USGS)
W74-00888

CHESAPEAKE BAY EXISTING CONDITIONS REPORT, APPENDIX B, THE LAND--RESOURCES AND USE, VOLUME II.
Corps of Engineers, Baltimore, Md.

310 P, 1973.

Descriptors: *Chesapeake Bay, *Water resources development, *Land resources, *Land use, Water supply, Water quality, Recreation facilities, Electric powerplants, Reviews, Projections, Evaluation.

Appendix B, Volume 2, of the Chesapeake Bay Existing Conditions Report contains 5 chapters entitled Water Supply, Water Quality, Recreation, Power, and Summary. Data on the present water supply facilities in the Chesapeake Bay Region should prove valuable in projecting future water supply needs and planning for the future use of the Bay's water resources. Existing water quality conditions in the Bay and its tidal tributaries are delineated. The beneficial water uses are considered with water quality standards established for the support of these uses. Water problems and inventories of industrial and municipal waste water discharges are presented. The present use and design capacities of recreational facilities on a subregional basis are provided. In addition, the type, location, and capacity of four recreation activities which include swimming, boating, camping, and picniking are tabulated. Electric power plants on the Bay and its tidal tributaries which are currently in operation or near completion are inventoried. A discussion of the social, economic, biological, chemical, and physical conditions which should be considered in the selection of plant sites also is included, along with an analysis of the effects of thermal additions on the water and land resources. (See also W74-00887, W74-00888, W74-00890, W74-00891 and W74-00924) (Woodard-USGS)
W74-00889

CHESAPEAKE BAY EXISTING CONDITIONS REPORT, APPENDIX C, THE BAY--PROCESSES AND RESOURCES, VOLUME I.
Corps of Engineers, Baltimore, Md.

1973, 331 P.

Descriptors: *Chesapeake Bay, *Water resources development, *Environmental effects, Beach erosion, Floods, Hurricanes, Navigation, Eutrophication, Aquatic plants, Dredging, Fish, Wildlife, Ecology, Erosion control.

Appendix C, Volume 1, of the Chesapeake Bay Existing Conditions Report contains 6 chapters: (1) Introduction, (2) Shoreline Erosion, (3) Hurricane Flooding, (4) Navigation, (5) Noxious Weeds, and (6) Fish and Wildlife Resources. All of the components of this appendix are, in some way, oriented toward the Bay and its resources. Delineation of areas where significant beach erosion has occurred as well as the rates of erosion are provided. Also discussed are the existing Federal and non-Federal erosion control projects along with the types of action which have been used to retard beach erosion. Important floods of the past, existing flood control measures, and present and potential flooding problems are described. The Bay's foreign and domestic commerce is itemized and quantified, and all Federal and State programs and projects which are supportive of the extensive waterborne traffic are outlined. The types and extent of noxious weeds, problems resulting from plants, current methods of control, and Federal and State control programs are examined as they affect navigation, flood control, agriculture, recreation, fish and wildlife preservation, and property value. (See also W74-00887 thru W74-00889, W74-00891 and W74-00924) (Woodard-USGS)
W74-00890

CHESAPEAKE BAY EXISTING CONDITIONS REPORT, APPENDIX C, THE BAY--PROCESSES AND RESOURCES, VOLUME II.
Corps of Engineers, Baltimore, Md.

1973. 387 P.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Classification, Environmental effects, Biological communities, Estuaries, Biology, Aquatic life, Ecosystems, Ecotypes, Sediments, Sedimentation, Salinity, Eutrophication, Benthos, Dominant organisms, Bioassay, Water quality, Pesticides, Water pollution sources, Water pollution effects.
Identifiers: *Biota taxonomy.

Appendix C, Volume 2, of the Chesapeake Bay Existing Conditions Report contains 2 chapters: Biota of Chesapeake Bay, and Summary. The existing condition of the biota of the Chesapeake Bay was prepared by the Chesapeake Research Consortium. The Consortium is composed of the Virginia Institute of Marine Science, the University of Maryland, the Johns Hopkins University, and the Smithsonian Institution. Research includes an analysis of biological criteria for environmental change plus two inventories. One is an inventory of biological organisms occurring within the Bay, the other includes research projects, institutions, and scientists involved in biota studies. The intent is to provide data on the existing processes and resources on the Bay so that ultimately a waterland management program can be established. (See also W74-00887 thru W74-00890 and W74-00892 thru W74-00924) (Woodard-USGS)
W74-00891

BACTERIA, YEASTS, VIRUSES AND RELATED MICROORGANISMS OF THE CHESAPEAKE BAY,
Georgetown Univ., Washington, D.C. Dept. of Biology.
R. R. Colwell.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-30--C-33, 1973. 15 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Bacteria, *Classification, Water pollution effects, Microorganisms, Sewage effluents, Water pollution sources, Yeasts, Viruses, Water quality, Water analysis, Coliforms, Reviews, Bibliographies.
Identifiers: *Protists taxonomy.

The taxonomy of the yeasts, bacteria, viruses, and other protists, viz., Rickettsia, Chamydia, and Mycoplasma, is presently under review. Because the taxonomy of the protists is presently in a state of flux, it is best to present taxonomic data as lists of genera within the major orders: Eubacteriales; Pseudomonadales; Hyphomicrobiales; Mycoplasmatales; Rickettsiales; Chlamydobacteriales; Caryophanales; Spirochaetales; Myxobacterales; and Actinomycetales. Because so little is known about the distribution of protists, other than the bacteria, in Chesapeake Bay, the taxonomical knowledge of groups other than the bacteria cannot be discussed profitably. Bacteria are widely distributed in Chesapeake Bay water and sediment and are found in association with the aquatic flora and fauna of the Bay. Total viable aerobic heterotrophic bacterial populations range from 100-1,000 per ml in water and 10,000-100,000 per gm in sediments. The species distribution of bacteria is related to the available substrate (s). Mercury-tolerant bacteria are found in the industrial spoil dumping areas, and variations in the bacterial flora have been found to occur with respect to geographical location within the Chesapeake Bay. Clearly, pollution of the Bay with new or incomplete sewage treatment raises the total bacterial load and introduces coliform bacteria. (See also W74-00891) (Woodard-USGS)
W74-00893

FUNGI OF THE CHESAPEAKE BAY,
Maryland Univ., College Park. Dept. of Botany.
C. A. Shearer.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-34--C-36, 1973. 18 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Aquatic fungi, *Classification, Estuaries, Environmental effects, Soils, Ecosystems, Ecology, Salinity, Water temperature, Biology, Water pollution effects, Reviews, Bibliographies.
Identifiers: *Fungi taxonomy.

Representatives of all major groups of fungi are known to occur in estuaries, and although a large number of species of fungi have been reported from estuaries, there have been few taxonomic studies of fungi in the Chesapeake Bay. Aquatic Phycomycetes in soils bordering the Patuxent River and the wood-inhabiting Ascomycetes and Fungi Imperfecti of the Patuxent River have been studied. The distribution of wood-inhabiting Ascomycetes and Fungi Imperfecti in the Patuxent River is affected by changes in salinity while the distribution of aquatic Phycomycetes in soils surrounding the upper Patuxent estuary is not affected by changes in salinity. Comprehensive and regular sampling for fungi is necessary before any generalizations about the distribution and abundance of fungi in the Bay can be made. Little is known about the sensitivity of estuarine fungi to man-induced environmental changes. In the Patuxent River, the addition of heated water during the summer months caused a decrease in the number of species and a replacement of the dominant species by another species common only at warm temperatures. (See also W74-00891) (Woodard-USGS)
W74-00894

NANNOPLANKTON OF THE CHESAPEAKE BAY,
Maryland Univ., College Park. Dept. of Botany; and Maryland Univ., Solomons. Natural Resources Inst.
S. D. Van Valkenburg.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-37--C-39, 1973. 4 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Nannoplankton, *Classifi-

cation, Estuaries, Water pollution sources, Pollutant identification, Aquatic life, Phytoplankton, Microorganisms, Reviews.
Identifiers: *Nannoplankton taxonomy.

The large majority of extant phytoplankton organisms is poorly known taxonomically, principally because only a relatively small number of species has been cultured. A number of diatoms and dinoflagellates and blue-green algae have been listed for Chesapeake Bay. However, very few nannoplankton or microplankton (herein designated as flagellated or coccoid photosynthetic, planktonic organisms of under 10 micro meters in diameter) have been reported for Chesapeake Bay. These omitted groups cover a large taxonomic area, including the Chrysophyceae, Haptophyceae, Xanthophyceae (or Xanthophyta), many of the Chlorophyceae, and all of the Crytophyta. Studies of primary production using C-14 and chlorophyll measurements have been made in Chesapeake Bay. Work is in progress to measure size fractionization of phytoplankton at specific locations in the Bay with reference to C-14 uptake, chlorophyll a, and species composition. Preliminary data indicate the contribution of the smaller organisms may approximate 50 percent of total production in the late winter months. Although the number of species of nannoplankton that have been adequately studied is relatively small, it is probable that these forms may have utility as indicator species for pollutional levels in the Chesapeake Bay. (See also W74-00891) (Woodard-USGS)
W74-00895

PHYTOPLANKTON OF THE CHESAPEAKE BAY,
Academy of Natural Sciences of Philadelphia, Benedict, Md. Benedict Estuarine Lab.
R. A. Mulford.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-40--C-56, 1973. 22 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Phytoplankton, *Classification, Estuaries, Nannoplankton, Aquatic life, Microorganisms, Environmental effects, Water temperature, Salinity, Diatoms, Biology, Ecosystems, Ecology, Reviews, Bibliographies.
Identifiers: *Phytoplankton taxonomy.

Organisms included in this Chesapeake Bay phytoplankton summary belong to four plant divisions and 10 classes. They are primarily the diatoms, dinoflagellates, silicoflagellates, planktonic green and blue-green algae and the micro flagellates, often referred to as the ultraplankton or nannoplankton. Thirty-six species have been selected from an initial listing of 613. Six percent of the total Bay phytoplankton species probably account for the majority of planktonic biomass exclusive of ultraplankton. Generally, diatoms are most abundant in the fall, winter, and spring period when water temperatures are below 20 deg C. However, temperature does not necessarily seem to be an important indicator of population density. Other parameters such as nutrients, day length, and turbidity are probably more significant. Planktonic diatom populations in the lower Bay are generally more diverse with a mixing of estuarine and marine or oceanic species. With the reduced salinity gradient near mid-Bay, many of the lower Bay forms disappear from the community and their place is taken by other species of green algae. Consequently, the Bay populations from the mouth to head mimic the river communities with their subsequent salinity gradients. (See also W74-00891) (Woodard-USGS)
W74-00896

BENTHIC MACROALGAE OF THE MARYLAND PORTION OF THE CHESAPEAKE BAY,
Maryland Univ., College Park. Dept. of Botany.
R. W. Krauss, and P. Orris.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-57--C-59, 1973. 2 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Benthos, *Aquatic algae, Estuaries, Classification, Environmental effects, Ecosystems, Ecology, Water pollution effects, Phosphates, Nutrients, Water temperature, Heavy metals, Reviews.
Identifiers: *Benthic Macroalgae taxonomy.

Records of benthic macroalgae (Xanthophyta, Chlorophyta, Phaeophyta, Rhodophyta) found in upper Chesapeake Bay are primarily from specimens housed in the University of Maryland Algal Herbarium (Department of Botany). A preliminary checklist was prepared from this collection, and further verification of these specimens is presently underway. No data is published on the distribution and abundance of macroalgae in the upper Bay. A better understanding of the largely unknown basic biology of benthic macroalgae would greatly aid in predicting the effect of man-induced environmental changes. Specifically, one needs to understand the metabolism of nutrients, such as phosphorus and nitrogen, in algae in order to predict the effect of phosphorus- and nitrogen-rich waste additions. The effect of temperature on photosynthesis, respiration, and growth rates, as well as life cycles and reproduction, must be understood to predict the effect of thermal additions or changes by man. The concentration of heavy metals at the base of the food web, the destruction of certain algae, or the enhancement of others to nuisance proportions has the potential of being detrimental to the entire biota of an area. (See also W74-00891) (Woodard-USGS)
W74-00897

MACROALGAE OF THE CHESAPEAKE BAY,
Virginia Inst. of Marine Science, Gloucester Point.
F. D. Ott.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-60--C-62, 1973.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Aquatic algae, *Estuaries, Ecosystems, Ecology, Classification, Water pollution sources, Water pollution effects, Environmental effects, Sewage effluents, Industrial wastes, Reviews.
Identifiers: *Macroalgae taxonomy.

There are approximately 213 taxa known for macroalgae flora along the Atlantic coasts of Maryland and Virginia including the Chesapeake Bay area. These are distributed into four algal divisions: Chlorophyta, taxa 55, percent 25.8; Phaeophyta, taxa 29, percent 13.6; Rhodophyta, taxa 54, percent 25.4; and Cyanophyta, taxa 75, percent 35.2. Much work remains to be done. The initial statement does not imply that all taxa for the area have been determined. Little information is available concerning the macroalgal flora of the salt marshes and of the deeper waters of the Chesapeake Bay and off the Virginia and Maryland coasts. The greatest population densities among the macroalgae are found on manmade structures (jetties, etc.). At dilute levels, sewage may cause luxuriant development of algae with the Ulvales, i.e., Ulva, Enteromorpha, being the last group of macroalgae to be adversely affected as the level of pollution increases. At very high levels of sewage pollution only blue-green algae are found. The effect on macroalgae of toxic inorganic and organic substances which may be released into the water by various industries is unknown. (See also W74-00891) (Woodard-USGS)
W74-00898

BRYOPHYTES AND LICHENS OF THE CHESAPEAKE BAY,
Maryland Univ., College Park. Dept. of Botany.
A. B. Owens.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-63--C-64, 1973. 8 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Lichens, *Estuaries, Ecosystems, Ecology, Classification, Environmental effects, Water pollution sources, Water pollution effects, Air pollution, Air pollution effects, Reviews, Bibliographies.
Identifiers: *Bryophytes, *Lichens taxonomy.

An extensive survey of the bryophytes which occur throughout the States of Maryland and Virginia has been made, although many areas need to be studied intensely. One such area is the Chesapeake Bay at its high tide line. A taxonomic survey of the lichens has not been made. There are no known aquatic lichens in this latitude. However, lichens do contribute to the biomass in the wetlands. There are no known bryophytes in salt or brackish water. However, some occur at the base of the Bay banks where they are in contact with lapping waves during extreme high tides. Several species are of frequent occurrence along the margins of the tributaries in the upper region of the Chesapeake Bay and its tributaries. Little data are available on the distribution of these plants in the lower region of the Bay. One lichen species, Caloplaca citrina (Hoffm.) Th.Fr., occurs abundantly on concrete within the spray zone along the Bay. The possible effects on the bryophytes of man-induced changes are not known. It is likely that changes in temperature would be detrimental to those few bryophytes which are truly aquatic. Lichens are natural indicators of air pollutants. Industrial and auto waste materials in the air are absorbed and accumulated within the lichen thallus. When a toxic level is reached the lichen dies. (See also W74-00891) (Woodard-USGS)
W74-00899

VIRUSES OF AQUATIC PLANTS OF THE CHESAPEAKE BAY,
Maryland Univ., College Park. Dept. of Botany.
M. K. Corbett.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-65--C-67, 1973. 12 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Viruses, *Biota, *Aquatic plants, Plant viruses, Classification, Estuaries, Ecosystems, Ecology, Water pollution sources, Water pollution effects, Biology, Aquatic microorganisms, Reviews, Bibliographies.
Identifiers: *Viruses taxonomy.

Little is known about the distribution of viruses of aquatic plants in the Chesapeake Bay. However, most plants, especially those of agronomic and horticultural importance, have been reported to suffer the adverse effects of viruses. Viral-like particles have been reported from a variety of cryptogamic hosts including the aquatic Phycomycete Aphelidium sp.; Agaricus bisporus; Peziza ostracoderma; Penicillium spp.; the green alga Chlorella pyrenoidosa; the freshwater red alga Serodotia tenuissima; the green alga Oedogonium sp.; and the marine brown alga Chorda tomentosa. Viruses have also been studied in the procaryotic blue-green algae and bacteria. A disease of Eurasian milfoil (Myriophyllum spicatum) was studied in the Chesapeake Bay by Bayley, et al, and was reported to be viral in nature. (See also W74-00891) (Woodard-USGS)
W74-00900

SUBMERGED VASCULAR PLANTS OF THE CHESAPEAKE BAY AND TRIBUTARIES,
American Univ., Washington, D.C. Dept. of Biology.
R. R. Anderson.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-68--C-71, 1973. 13 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Submerged plants, *Vascular tissues, Classification, Estuaries, Aquatic populations, Ecosystems, Ecology, Fish, Wildlife, Water pollution effects, Water pollution sources, Nutrients, Salinity, Reviews, Bibliographies.
Identifiers: *Submerged vascular plant taxonomy.

Submerged vascular plants are widely distributed in the Chesapeake Bay and tributaries wherever shallow, quiet, and relatively clean waters are present. Little is known of population fluxes, interspecies relationships, or rates at which new areas may be colonized. Extensive rhizone systems shallowly buried in the bottom muds provide the bulk of reproductive potential. Water salinity and bottom type appear to be the major environmental factors controlling species distribution. The general roles that submerged plants play in aquatic ecosystems is well known. These include bottom stabilization, water oxygenation, shelter and food for young fish, and flood for wildfowl. There is some documentation on wildfowl use of aquatic vegetation in the Bay. R. maritima, V. americana, C. demersum, Z. marina are considered to be very important food sources for resident and migrating waterfowl. There have been population explosions of some species which appear to be related to nutrient pollution. Elodea canadensis and Myriophyllum spicatum have at times been plant pests, the latter being most serious during the last 10 years. Ruppia maritima has been very sensitive to increases in water turbidity. (See also W74-00891) (Woodard-USGS)
W74-00901

EMERGENT VASCULAR PLANTS OF CHESAPEAKE BAY WETLANDS,
Smithsonian Institution, Edgewater, Md. Chesapeake Bay Center for Environmental Studies.
D. Higman.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-72--C-80, 1973. 3 tab, 17 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Vascular tissues, *Wetlands, Classification, Ecosystems, Ecology, Water pollution sources, Water pollution effects, Dredging, Engineering structures, Sewage effluents, Environmental effects, Salinity, Biology, Reviews, Bibliographies.
Identifiers: *Emergent vascular plant taxonomy.

Two annotated checklists have recently been compiled for vascular plants of the Chesapeake Bay and areas potentially subject to flooding by it (Krauss et al, 1971; Wass, 1972). The Maryland list of 421 species covers all land areas within the high tide limits of the Bay and its tributaries, both in Maryland and Virginia. The Virginia Institute of Marine Sciences (VIMS) list of 435 species is restricted to Virginia (including the barrier islands of the Atlantic seashore) and the Patuxent River estuary in Maryland. Both lists include the flora of salt and brackish marshes, beaches, and freshwater swamps. The VIMS also covers ponds and floodplains on tidal creeks and shores subject to storm wave inundation. Each list contains many species not found in the other, so together they probably comprise a fairly complete flora of Chesapeake Bay wetlands. Since the distribution of many salt marsh species depends to some degree upon salinity, engineering projects which alter the salinity of portions of the Bay likewise alter the floristic composition of salt marshes in the affected areas. Pollution by sewage raises the level of nutrients in salt marshes. Wass and Wright (1969) noted that Spartina spp. grows taller and has a darker green color than normal when sewage is present. During the growing season, salt marshes are able to absorb some of the excess nutrients which otherwise would create algal blooms in the estuaries. (See also W74-00891) (Woodard-USGS)
W74-00902

VASCULAR PLANTS OF THE CHESAPEAKE BAY,
Maryland Univ., College Park. Dept. of Botany.
R. G. Brown, and J. L. Reveal.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-81--C-86, 1973. 40 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Vascular plants, *Aquatic life, Estuaries, Classification, Ecosystems, Ecology, Water pollution sources, Water pollution effects, Dredging, Environmental effects, Biology, Salinity, Reviews, Bibliographies.
Identifiers: *Vascular plant taxonomy.

Most of the vascular plants found in and around Chesapeake Bay are taxonomically well known and understood. The food produced by photosynthesis in vascular plants is of utmost importance. Much of this is consumed directly as fruits, seeds, or vegetative tissue by various mammalian and avian species of the marshes and open water. Vascular plants provide stability to aquatic and sandy habitats. Both of these habitats are currently being subjected to increasing stress from urbanization and from dredge and fill operations. It is lamentable that the technology that might permit artificial propagation of selected species (such as Zostera, Juncus, etc.) does not currently exist. Such technology could provide for reclamation of dredged areas, reduce erosion losses, and allow for a greater number of management options. Vascular plants are extremely sensitive indicators of environmental change. They have been suggested or used as indicators for air pollution levels, ambient radioactivity levels, chemical and nutrient levels of the substrate, and as microclimatological indicators. (See also W74-00891) (Woodard-USGS)
W74-00903

FREE-LIVING PROTOZOA OF THE CHESAPEAKE BAY EXCLUSIVE OF FORAMINIFERA AND THE FLAGELLATES,
Maryland Univ., College Park. Dept. of Zoology.
E. B. Small.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-87--C-89, 1973. 8 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Protozoa, Classification, Biology, Estuaries, Ecosystems, Ecology, Water pollution sources, Water pollution effects, Sewage effluents, Salinity, Environmental effects, Reviews, Bibliographies.
Identifiers: *Protozoa taxonomy.

The free-living protozoa discussed include the ciliaphora and amoeboid sarcodinids. The biology of the free-living protozoa within the Chesapeake Bay is understood only by analogy to those protozoan organisms studied in other estuarine communities. Protozoa generally feed on a wide variety of foodstuffs at the very base of the food pyramid (e.g. bacteria, fungi, unicellular algae, blue-green algae, other protozoa, tissues of metaphytan and metazoan organisms) and excrete nitrogen and phosphorus into their aquatic environments. Since bacteria are known to be a major component of waste water derived from sewage disposal plants, the bactivorous ciliates probably play a major role in and form a prominent part of the biomass living in highly polluted estuarine waters. (See also W74-00891) (Woodard-USGS)
W74-00904

FORAMINIFERA OF THE CHESAPEAKE BAY,
Smithsonian Institution, Washington, D.C. Dept. of Paleobiology.
M. A. Buzas.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-90--C-91, 1973.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Protozoa, Classification, Estuaries, Ecosystems, Ecology, Water pollution sources, Water pollution effects, Sewage effluents, Environmental effects, Salinity, Water temperature, Oxygen, Reviews.
Identifiers: *Foraminifera taxonomy.

Chesapeake Bay Foraminifera have been inadequately studied. The Virginia Institute of Marine Sciences (VIMS) 1972 checklist cites 21 species belonging to seven families. New observations here have enlarged this to 28 species and 14 families. Two biofacies in the Rappahannock and Choptank estuaries contain as principals the genera Ammobaculites and Elphidium. In marshes the two principal biofacies are dominated by Miliammina and Ammoastuta. Monthly sampling with replicates at three stations over the period of a year in the Choptank River indicate that the genera Ammobaculites, Elphidium, and Ammonia vary in their periodicity among themselves as well as between stations. This periodicity can be accounted for in part by temperature, salinity, oxygen, chlorophyll a, b, and c. No single environmental variable can account for the observed periodicities. General linear models containing 15 parameters successfully accounted for the variability of each species. The distribution of the Foraminifera in the other rivers of the bay system are documented. The Foraminifera are mainly herbivores. In those species studied the principal food has been diatoms. Bacteria, however, have also been demonstrated as a requirement to successfully maintain some cultures. (See also W74-00891) (Woodard-USGS)
W74-00905

CTENOPHORES OF THE CHESAPEAKE BAY,
Richmond Univ., Va.
J. W. Bishop.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-92--C-95, 1973. 20 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Jelly fish, Classification, Estuaries, Aquatic life, Ecosystems, Ecology, Environmental effects, Water pollution effects, Nutrients, Food chains, Reviews, Bibliographies.
Identifiers: *Ctenophore taxonomy.

Ctenophores commonly are called water gulls, comb jellies, sea walnuts, and jellyfish. B. ovata ranges from the tropical Atlantic to the Chesapeake Bay. In the Chesapeake Bay, it is found at salinities above 15 ppt and is most abundant during late summer and early fall. Its abundance in the Bay may be controlled largely by hydrological factors. Field observations of the vertical distributions of ctenophores indicate that M. leidyi is found at a variety of depths, but is attracted to light and tends toward greater depths in rough weather and in low salinities. Smaller individuals concentrate within currents near the bottom and therefore may be carried upstream in an estuary. M. leidyi eats a wide variety of zooplankton up to about 6 mm in length. When it is abundant, crustacean zooplankton and oyster sets often are reduced. Its predatory activities can account for 73% of the total predation on small zooplankton in the York River and 52% of the daily mortality of the predominant copepod Acartia tonsa in the Patuxent River. Ctenophores eliminate about 90% of assimilated nitrogen and therefore may play an important role in recycling nutrients. (See also W74-00891) (Woodard-USGS)
W74-00906

CNIDARIA OF THE CHESAPEAKE BAY,
Virginia Inst. of Marine Science, Gloucester Point.
D. R. Calder.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-96--C-99, 1973. 33 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Invertebrates, Jelly fish, Aquatic life, Classification, Ecosystems, Ecology, Estuaries, Water pollution effects, Environmental effects, Water temperature, Salinity, Oxygen demand, Reviews, Bibliographies.
Identifiers: *Cnidaria taxonomy.

The hydrozoans and scyphozoans of Chesapeake Bay are well known taxonomically. The four species of scyphomedusae occurring in the Bay are easily distinguished, and problems in the identification of their scyphistomae and ephyrae have been resolved. Ten species of anthozoans are known from the area, but the class has not been adequately studied. Well established common names exist for the scyphomedusae, including the sea nettle (Chrysaora quinquecirrha), the moon jelly (Aurelia aurita) and the lion's mane (Cyanea capillata). Only one hydroid, the abundant and conspicuous Sertularia argentea, has a common name. It is referred to as grass by fishermen and the silvery hydroid or thuiaria by marine scientists. Among anthozoans, Astrangia danae is called the star coral. Within the Hydrozoa, salinity and temperature optima vary widely from one species to another. Some (Cordylophora caspia, Moerisia lyonsi) are restricted to low salinities, while others (Tubularia crocea, Hydractinia echinata) occur only in higher salinities. Species composition changes markedly from summer to winter. With the possible exception of Nemopsis bachei, no species is known to remain active throughout the year. Scyphistomae are tolerant of low oxygen levels, although well oxygenated water may be necessary for strobilation. (See also W74-00891) (Woodard-USGS)
W74-00907

PRIAPULIDA OF THE CHESAPEAKE BAY,
Smithsonian Institution, Washington, D.C. Office of Environmental Sciences.
R. P. Higgins.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-100--C-101, 1973. 1 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Aquatic life, *Invertebrates, Classification, Estuaries, Ecosystems, Ecology, Environmental effects, Water temperature, Salinity, Oxygen demand, Water pollution effects, Reviews.
Identifiers: *Priapulida taxonomy.

No priapulida have been reported for the Chesapeake Bay. This presentation is submitted on the basis that it is possible that one or more species could be present in the Bay. Two species have been reported from the eastern coastal waters of the U.S. (New England): Priapulus caudatus and Priapulopsis bicaudatus. Priapulids are widely distributed but usually prefer cold water habitats. One exception is Tubiluchus corallicola, found in shallow, tropical waters. If present in the Bay, they will fill a minor benthic predator niche and offer a negligible food source to vertebrates and invertebrates. Priapulids are capable of withstanding wide variations in salinity (4 ppt to 65 ppt) and moderately low oxygen concentrations (2 ml per liter). (See also W74-00891) (Woodard-USGS)
W74-00908

TARDIGRADA OF THE CHESAPEAKE BAY,
Smithsonian Institution, Washington, D.C. Office of Environmental Sciences.
R. P. Higgins.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-102--C-104, 1973. 6 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Aquatic life, *Invertebrates, Classification, Estuaries, Ecosystems, Ecology, Environmental effects, Salinity, Sediments, Water pollution effects, Oxygen demand, Reviews, Bibliographies.
Identifiers: *Tardigrada taxonomy.

Tardigrades, occasionally called water bears, constitute a well defined taxonomic group of aquatic invertebrates rarely exceeding 1 mm in length. The greater number of described species are found in freshwater. Many species are ubiquitous, however very little is known about their distribution. Many species, several of which are marine, are capable of cryptobiosis (drying) and may be distributed by wind. Nine species have been reported from marine or estuarine environments on the eastern U.S. coast. Four of these are reported from Chesapeake Bay: Batillipes mirus, B. bullacaudatus, Stygarctus bradypus and Halechiniscus remanei. Considering the habitats of Chesapeake Bay, many marine and freshwater species should be expected in collections of meiobenthic invertebrates. Although the average sediment sample contains very few tardigrades, many thousands per cubic liter may occur in some habitats, especially in moist beach sand. Tardigrades feed on algae and other plants and small invertebrates, including other tardigrades. Post-embryonic development is direct. Some tardigrades are moderately tolerant of low oxygen tension and variation in temperature and salinities. (See also W74-00891) (Woodard-USGS)
W74-00909

KINORHYNCHA OF THE CHESAPEAKE BAY,
Smithsonian Institution, Washington, D.C. Office of Environmental Sciences.
R. P. Higgins.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-105--C-107, 1973. 11 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Aquatic life, *Invertebrates, Classification, Estuaries, Ecosystems, Environmental effects, Salinity, Sediments, Water temperature, Reviews, Bibliographies.
Identifiers: *Kinorhyncha taxonomy.

To date no kinorhyncha has been reported from the Chesapeake Bay. Representatives of at least four genera--Pycnophyes, Trachydmus, Echinoderes, and Centroderes--are found. Kinorhynchs are widely distributed in marine and estuarine sediments from intertidal to abyssal depths, at salinities from 7 ppt to 60 ppt but more normally within a range of 18 ppt to 40 ppt and at all latitudes from the Arctic to Antarctic. Kinorhynchs are small (less than 1 mm), bilaterally symmetrical, appendageless pseudococlomate worms which have the distinction of being the only ascheleth with distinct external, (integument) and to some extent internal (muscles and nervous system) segmentation. They are an important and ubiquitous constituent of the meiobenthos in marine and estuarine sediments. They remain cryptic primarily because of difficulties in processing and identifying them. However, they generally constitute a moderately important part of the meiobenthos, serving as a source of food for sediment feeders, and themselves feeding on diatoms, other microalgae, and detritus. W74-00910

DIGENETIC TREMATODES OF THE CHESAPEAKE BAY,
Gulf Coast Research Lab., Ocean Springs, Miss.
R. M. Overstreet.
Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-108--C-110, 1973. 7 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Aquatic life, *Invertebrates, Classification, Ecosystems, Estuaries, Worms, Parasitism, Ecology, Environmental effects, Biology, Fish diseases, Reproduction, Reviews, Bibliographies.
Identifiers: *Trematode taxonomy, Flatworm, Parasites.

The taxonomy of Digenea from fishes and invertebrates from Chesapeake Bay is in need of considerable attention. The viscera from several preserved fishes from the Bay were examined for parasites for a list of parasites. Most of the fish were infected with Digenea and most were new records for the parasite to be found in the particular host/and in the Bay area. These findings suggest that Digenea are abundant and their distribution poorly known. The biology of several trematodes from near Woods Hole and from other areas along the Atlantic coast have been studied. Some of the studied worms probably occur in the Bay. In general, however, the life histories and other aspects of the biology of marine and estuarine trematodes are poorly understood. Digenea are especially valuable as indicators of environmental conditions. Molluscs are the first intermediate host for all known Digenea but two. In order for a trematode larva to infect a mollusc and asexually produce larvae capable of infecting a second intermediate host, the trematode must depend on both a receptive host and satisfactory environmental conditions. Proper conditions are also necessary for development in the second or addition intermediate hosts and in the definitive host. (See also W74-00891) (Woodard-USGS)
W74-00911

MOLLUSCS OF THE CHESAPEAKE BAY,
Maryland Univ., Solomons. Natural Resources Inst.
H. T. Pfitzenmeyer.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-111--C-127, 1973. 154 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Aquatic life, *Mollusks, Classification, Esturaries, Invertebrates, Shellfish, Ecosystems, Ecology, Environmental effects, Water temperature, Salinity, Sediments, Water pollution effects, Biology, Reviews, Bibliographies.
Identifiers: Molluscs taxonomy.

Molluscs in Chesapeake Bay are generally well defined on the generic and specific level. The most comprehensive list for all molluscs of the Bay contains 121 species. It is most complete for the lower Bay area but also contains most of those species found in the Maryland or upper portion of the Bay. Most Bay research has centered on three commercial species, the oyster, Crassostrea virginica; the soft-shell clam, Mya arenaria; and the hard-shell clam, Mercenaria mercenaria. The oyster, the most economically important species, has been well studied with respect to its distribution and variable abundance in the Bay. Perhaps the greatest contribution any single mollusc makes towards the ecology of the Bay would be the formation of shell bars and reefs by oysters. The shell surfaces of live and dead oysters provide the necessary hard substrate and crevices for the attachment of a great number of animals and plants which cannot exist on mud or sand bottoms. Alteration of the Chesapeake Bay by chemical and physical means reduces populations of desirable food species for man or for other species lower in the food chain or creates an unhealthy environment. (See also W74-00891) (Woodard-USGS)
W74-00912

POLYCHAETES OF THE CHESAPEAKE BAY,
Maryland Univ., Solomons. Natural Resources Inst.
D. H. Hamilton, Jr.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-128--C-131, 1973. 8 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Aquatic life, *Worms, Classification, Invertebrates, Estuaries, Ecosystems, Biology, Environmental effects, Sediments, Salinity, Water temperature, Water pollution effects, Reviews, Bibliographies.
Identifiers: *Polychaete taxonomy.

With the exception of larval stages, the taxonomy of the Chesapeake Bay polychaetes is well worked out, partially as a consequence of the restricted diversity of the fauna, which totals only about 110 species in all. Polychaetes are ubiquitously distributed in the Bay, colonizing not only sediments but also Aufwuchs (periphyton) communities, oyster bars, and virtually every other subsurface substratum. Members of the class occur throughout the range of salinities and temperatures encountered in the Bay. In sandy habitats they are second in importance among the macroscopic infauna only to the bivalves. In silt-clay habitats they are normally the most abundant macrofauna (greater than 1 mm. in shortest dimension) and constitute a major component of the biomass in all sediments. Polychaetes seem to be much more resistant to man-induced environmental changes than crustaceans or molluscs, and may be of particular value in the study of such problems. Recent work at Chesapeake Biological Laboratory has shown that even in grossly polluted areas of Baltimore Harbor, large populations of polychaetes may be found. Nereis succinea seems to occur preferentially and at considerable densities (400/sq.meter) in a partially anaerobic ooze with high organic content near Cove Point. (See also W74-00891) (Woodard-USGS)
W74-00913

FREE-LIVING COPEPODA OF THE CHESAPEAKE BAY,
Maryland Univ., Solomons. Natural Resources Inst.
D. R. Heinle.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-132--C-135, 1973. 18 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Aquatic life, *Copepods, Classification, Esturaries, Invertebrates, Ecosystems, Biology, Ecology, Water pollution effects, Environmental effects, Salinity, Water temperature, Reviews, Bibliographies.
Identifiers: *Copepoda toxonomy.

Of the 73 species of copepods listed from Chesapeake Bay about five are abundant. The calanoid Acartia tonsa (Dana) is found throughout the year at all salinities but is most abundant from April to October. Population densities are commonly 100,000 to 200,000 individuals per cubic meter and sometimes exceed 1,000,000 during that period. During winter and early spring A. tonsais exceeded by the calanoids A. clausi at higher salinities and Eurytemora affinis (Poppe) at lower salinities. Acartia clausi occurs to salinities as low as 5 ppt (Baltimore Harbor) and E. affinis to salinities as high as 12 ppt (mid-Bay). Densities of both of these species are commonly in excess of 200,000 per cubic meter, and E. affinis at times exceeds 3,000,000. The relatively small Oithona brevicornis (Biesbracht) is found at higher salinities greater than 10 ppt all year but appears to breed during the summer months when it acheives greatest densities. This species is epibenthic in habit. Adults and immature copepodites of this species at times exceed 100,000 per cubic meter. The harpacticoid S. canadensis has pelagic nauplii which at times exceed 1,500,000 per cubic meter. The adults of this species are epibenthic. (See also W74-00891) (Woodard-USGS)
W74-00914

DECAPOD CRUSTACEANS OF THE CHESAPEAKE BAY,
National Marine Fisheries Service, Washington, D.C.
A. B. Williams.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-136--C139, 1973. 25 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Aquatic life, *Crustaceans, Classification, Esturaries, Biology, Ecosystems, Environmental effects, Salinity, Water temperature, Water pollution effects, Pesticides, Ecology, Reviews, Bibliographies.
Identifiers: *Decapod toxonomy.

Most of the decapod species found in the Chesapeake Bay are taxonomically stable. Manuals for identification and an annotated check list for Bay species are available which provide both systematic and distributional information. Salinity and temperature are the dominant factors governing distribution of estuarine animals. Some species are better adapted to life in Chesapeake Bay than others, and the abundant Callinectes, Palaemonetes and xanthid species, as well as some Uca, are dominant decapod crustaceans there. The remaining species listed range from accidental oceanic intruders, through seasonal residents, to moderately tolerant forms confined largely to the lower Bay. Upogebia and Polyonyx are tube dwellers, the latter a commensal with annelids as are some of the pinnotherid crabs, while two of the pinnotherids are essentially parasites in mollusks. Probably the most imperfect state of knowledge is that regarding reactions of these animals to induced environmental changes. Penaeus and Callinectes are differentially affected by pesticides and herbicides (DDT, Dibron, Antimycin A, Strobane, BHC, Dieldrin, Dursban, Parathion, 2-4-D acetamide, among those tested) depending on pollutant, concentration, and length of exposure. (See also W74-00891) (Woodard-USGS)
W74-00915

FISHES OF THE CHESAPEAKE BAY,
Virginia Inst. of Marine Science, Goucester Point.
J. Musick, and M. L. Wiley.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-141--C-142, 1973.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Aquatic life, *Fish, Classification, Esturaies, Biology, Ecosystems, Environment effects, Water pollution effects, Dredging, Industrial wastes, Ecology.
Identifiers: *Fish taxonomy.

The fishes are a very conspicuous and important component of the fauna of Chesapeake Bay. The taxonomic status of the group is probably understood as well for the Bay as any other comparable geographic area but much work remains to be done at the subspecific and racial levels. Least known is the seasonal occurrence of large adult marine species, particularly sharks. Commercial fisheries catch statistics provide crude estimates of the relative abundance of commercially important species from year to year. Some species of fish inhabits nearly every available habitat within the Bay, and collectively they consume at all zooplankton (anchovies, silversides) and bottom invertebrates (hogchoker, white perch). Some are generalized predators (Striped bass) while others live mainly on molluscs (drums, cownosed rays), fishes (bluefish), or crustaceans (oyster toadfish). The effects of individual environmental changes (dredging, thermal or chemical pollution, etc.) have been determined for certain species. The possible effects of each one of all the major changes which have or are likely to occur in the Bay system have not been determined for a single species. (See also W74-00891) (Woodard-USGS)
W74-00916

AMPHIBIANS OF THE CHESAPEAKE BAY REGION,
Maryland Univ., Solomons. Natural Resources Inst.
J. D. Hardy, Jr.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report Append C, Vol 2, p C-143--C 153, 1973. 48 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Amphibians, Classification, Estuaries, Biology, Frogs, Salamanders, Toads, Ecosystems, Environmental effects, Water pollution effects, Pesticides, Ecology, Reviews, Bibliographies.
Identifiers: *Amphibian taxonomy.

A list of 43 species and subspecies of amphibians known to occur on the Atlantic Coastal Plain in the latitudes of Chesapeake Bay is presented. The range of Eurycea longicauda guttolineata ends abruptly at the Potomac River where it is replaced (but only west of the Fall Line) by Eurycea l. longicauda. Two disjunct populations of frogs occur in the Maryland portion of the Chesapeake Bay region: Gastrophryne carolinensis is known only from St. Marys, Calvert, and Dorchester Counties, while Rana virgatipes is limited to the southern portion of the eastern shore. Tadpoles are usually regarded as vegetarians, but are occasionally carnivourous, and sometimes cannibalistic. Salamander larvae and adult toads, frogs, and salamanders are entirely carnivourous, and primarily insectivorous. Studies of DDT accumulations in Acris crepitans, Rana pipiens, Rana clamitans, and Rana catesbeiana are reviewed. Adult frogs usually contain lower amounts of residues than fish, snakes, and birds. Even sublethal doses of DDT cause radically abnormal behavior in tadpoles. (See also W74-00891 (Woodard-USGS)
W74-00917

REPTILES OF THE CHESAPEAKE BAY REGION,
Maryland Univ., Solomons. Natural Resources Inst.
J. D. Hardy, Jr.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-154--C-164, 1973. 36 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Reptiles, Classification, Estuaries, Snakes, Turtles, Biology, Ecosystems, Environmental effects, Water pollution effects, Pesticides, Ecology, Reviews, Bibliographies.
Identifiers: *Reptile taxonomy.

Fifty-eight species and subspecies of reptiles are listed that occur in the Chesapeake Bay region. Three turtles (Clemmys insculpta, Clemmys muhlenbergi, and Malaclemys geographica) are predominately upland or northern species which reach the Atlantic Coastal Plain only at the head of the Chesapeake Bay. One snake, Regina septemvittata, is predominately a piedmont species, but encroaches on the coastal plain in both Maryland and Virginia. Most of the regional reptiles show a definite habitat preference, but are not wholly restricted to the preferred habitat. Regional lizards are predominately insectivorous, although all of them consume a variety of other invertebrates including snails, spiders, and millipedes, and large specimens of Eumeces occasionally eat young lizards and mice. Bay area snakes are all carnivorous, and the food varies greatly from species to species. Certain water snakes subsist almost exclusively on frogs and fish while the king snake, Lampropeltis getulus, frequently feeds on other reptiles including the copperhead, Agkistrodon contortrix. DDT is known to be especially dangerous to reptiles, especially those which feed on insects. (See also W74-00891) (Woodard-USGS)
W74-00918

WATERFOWL OF THE CHESAPEAKE BAY,
Bureau of Sport Fisheries and Wildlife, Jamestown, N. Dak. Northern Prairie Wildlife Research Center.
R. E. Stewart.

In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report Append C, Vol 2, p C-165--C-170, 1973. 22 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Waterfowl, Classification, Estuaries, Birds, Ducks (Wild), Geese (Wild), Aquatic life, Biology, Ecosystems, Ecology, Environmental effects, Water pollution effects, Reviews, Bibliographies.
Identifiers: *Waterfowl taxonomy.

Many species of bird, other than waterfowl, are characteristic inhabitants of regular occurrence on one or more habitats of Chesapeake Bay during appropriate seasons of the year. These total 75 species and represent 22 families: Gaviidae (loons), 2 sp.; Podicipedidae (Grebes), 3 sp.; Sulidae (Gannets), 1 sp.; Phalacrocaracidae (cormorants), 1 sp.;Ardeidae (herons), 9 sp.; Accipitridae (hawks and eagles), 3 sp.; Pandionidae (ospreys), 1 sp.; Falconidae (falcons), 2 sp.; Rallidae (Rails and coots), 7 sp.; Charadriidae (plovers and turnstones), 4 sp.; Scolopacidae (snipe, sandpipers, etc), 13 sp.; Laridae (gulls and terns), 11 sp.; Tytonidae (barn owls), 1 sp.; Strigidae (typical owls), 1 sp.; Alcedinidae (Kingfishers), 1 sp.; Hirundinidae (swallows), 2 sp.; Corvidae (crows), 2 sp.; Troglodytidae (wrens), 2 sp.; Motacillidae (pipits), 1 sp.; Parulidae (wood warblers), 1 sp.; Icteridae (Blackbirds, etc), 3 sp.; and Fringillidae (sparrows), 4 sp. For the majority of waterfowl, widgeongrass (Ruppia maritima) probably is the most important single food item. In many areas of Chesapeake Bay that were formerly important to waterfowl, the quality of habitat has deteriorated greatly during recent years mainly because of pollution and increasing turbidity. (See also W74-00891) (Woodard-USGS)
W74-00919

CURRENT STATUS OF THE KNOWLEDGE OF THE BIOLOGICAL EFFECTS OF SUSPENDED AND DEPOSITED SEDIMENTS IN CHESAPEAKE BAY,
Maryland Univ., Prince Frederick. Hallowing Point Field Station.
J. A. Sherk, Jr.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-172--C-183, 1973. 47 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Sediment transport, *Sediments, Inflow, Streamflow, Erosion, Sedimentology, Ecosystem, Biology, Environmental effects, Turbidity, Bottom sediments, Suspension, Aquatic life, Reviews, Bibliographies.

Particulate material in the Chesapeake Bay can originate from organic/and inorganic particles carried in by rivers, atmospheric fallout, biological activity, chemical reactions, resuspension from the bottom, disposal of wastes, and shore erosion. The particles carried in by rivers can be rock and mineral fragments such as quartz, feldspar, and mica (including clay) which serve as a substrate for microorganisms and affect light transmission in the water column. In addition, organic matter fragments can make up about 26% (160,000 tons) of the total seston entering the Upper Bay from the Susquehanna River. The two major sources of suspended material to the Upper Bay the Susquehanna River. The two major sources of suspended material to the Upper Bay are the Susquehanna River (670,000 tons/year) and shore erosion 100,000 tons/year). Most of the Susquehanna contribution for 1966 occurred during Spring runoff with about 90% of this material remaining in the northern Bay area. Particles suspended in the water column can impair light penetration and thus limit primary productivity by limiting the column of water in which light intensity is sufficient (about one percent of incident light) for the rate of photosynthesis to exceed respiration. Resuspended sediments exert an oxygen demand on the order of eight times that of the same material in bottom deposits. (See also W74-00891) (Woodard-USGS)
W74-00920

CURRENT STATUS OF KNOWLEDGE CONCERNING THE CAUSE AND BIOLOGICAL EFFECTS OF EUTROPHICATION IN CHESAPEAKE BAY,
Maryland Univ., Solomons. Natural Resources Inst.
D. A. Flemer.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report Append C, Vol 2, p C-184--C-192, 1973. 28 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Eutrophication, *Water pollution effects, Nutrients, Nusance algae, Biochemical oxygen demand, Estuaries, Reviews, Bibliographies.

The Chesapeake Bay is in serious future danger from nutruent enrichment. It could be the most intractable problem that management will face during the next few years. There are obviously limits to the solution of nutrient pollution by dilution, even for a large estuary. Major areas of phytoplanktonic standing crop and nutrient loading in Chesapeake Bay, especially N and P, have been identified. In addition, the tributaries of the upper Bay are rapidly showing signs of deterioration. The blue-green alga, Anacystis sp. has appeared as objectionable blooms since the summer of 1968 in the Elk River. There is a tendency for the blue-green pulses to appear earlier, last longer, and cover more area. Observations on the upper Patuxent estuary are interesting since winter concentrations of inorganic N and P often approach those reported for the upper Potomac and James subestuaries. Yet, nuisance blue-green algae have not overtaken the Patuxent to date. There is the possibility that the well developed marsh system in the upper Patuxent estuary serves as a natural tertiary treatment system. (See also W74-00891) (Woodard-USGS)
W74-00921

CURRENT STATUS OF KNOWLEDGE OF THE BIOLOGICAL EFFECTS OF HEAVY METALS IN THE CHESAPEAKE BAY,
Johns Hopkins Univ., Baltimore, Md. Dept. of Environmental Medicine.
J. M. Frazier.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report Append C, Vol 2, p C-193--C-201, 1973. 35 ref.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Heavy metals, Water pollution effects, Trace elements, Chemical wastes, Toxicity, Ecosystems, Bottom sediments, Aquatic life, Fish, Shellfish, Ecology, Mercury, Cadmium, Copper, Zinc, Reviews, Bibliographies.

Man's activities introduce heavy metals into the Chesapeake Bay system by many pathways, some of which are documented and others for which little information is available. The distribution, magnitude and characteristics of point sources such as industrial and domestic outfalls, dumping sites, and dredging projects have been investigated by the Environmental Protection Agency through the Annapolis Technical Laboratory, the Maryland Environmental Service, and the Virginia Institute of Marine Science (VIMS), but the heavy contributions of the more diffuse sources such as agricultural runoff, the flushing of urban areas during heavy rains, and the scrubbing out of air pollutants by precipitation and dry fallout are inadequately determined. The physical cycling of heavy metals in the system by means of dilution, current dispersion, turbulent diffussion, and sedimentation are fairly well understood; however, the chemical cycling through such processes as absorption, ion exchange, complex formation, chelation, flocculation, and coprecipitation have been poorly studied. There exist some data on the levels of heavy metals in marine organisms of the Chesapeake Bay. The Hg in blue crab, Callinectes sapidus, oysters, Crasostrea virginica, eels, Anguilla rostrata, white perch, Morone americana, catfish, Ictalurus spp. and striped bass, Morone saxatilis, has been measured, levels of which never exceeded the FDA standards of 0.5 ppm. (See also W74-00891) (Woodard-USGS)
W74-00922

CURRENT STATUS OF RESEARCH ON THE BIOLOGICAL EFFECTS OF PESTICIDES IN CHESAPEAKE BAY,
Westinghouse Ocean Research Lab., Annapolis, Md.
T. O. Munson, and R. J. Huggett.
In: Army Corps of Engineers Chesapeake Bay Existing Conditions Report, Append C, Vol 2, p C-202--C-205, 1973.

Descriptors: *Chesapeake Bay, *Water resources development, *Biota, *Pesticides, *Water pollution effects, Water pollution sources, DDT, Toxicity, Fish, Biology, Ecosystems, Ecology, Sediments, Shellfish, Anadromous fish, Estuaries, Reviews.

Very little is known about the biological effects of pesticides in the Chesapeake Bay. Although some information is available from laboratory studies about the short and long-term toxicities of certain persistent pesticides relative to some of the species found in the Bay, only in a few isolated cases have mortalities observed in the field been known to be directly attributable to pesticides. During a program to examine the role of an anadromous fish, the alewife, in pesticide transport, samples from the Potomac, James, and Rappahannock Rivers were analyzed. Apparently the alewives picked up Pesticides on their journey up the Bay, because the ones taken in the rivers had much higher pesticide levels than the ones taken from the ocean at the mouth of the Bay. During the period 1965-1970, 88 oyster samples collected by the Maryland State Department of Natural Resources were analyzed by the State Department of Mental Health and Hygiene. Of the 81% of the samples which contained DDT residues, most fell in the 0.011 to 0.011 ppm range, with the highest value being 0.070 ppm. (See also W74-00891) (Woodard-USGS)
W74-00923

CHESAPEAKE BAY EXISTING CONDITIONS REPORT, APPENDIX D--MAP FOLIO.
Corps of Engineers, Baltimore, Md.

1973, 53 P.

Descriptors: *Chesapeake Bay, *Water resources development, *Land resources, *Land use, *Maps, Shores, Geology, Geomorphology, Contours, Altitude, Sediments, Topography, Water resources, Water supply, Recreation facilities, Electric powerplants, Beach erosion, Navigation, Projects, Aquatic plants, Eutrophication, Sport fishing, Commercial fishing, Wetlands, Wildlife, Water pollution.

Appendix D, a map folio of the Chesapeake Bay Existing Conditions Report, has been structured to provide the reader with a visual information supplement to Appendices B and C. Composed of plates which are too large to appear in the appendices themselves, Appendix D presents a visible recognition of project locations and problem areas associated with data presented in the other appendices. The plates refer to such data as land use, groundwater, water supply, recreation, power, beach erosion, navigation, noxious weeds, and fish and wildlife. It is also intended that through comparison of these plates some of the conflicts in water resource development around the Bay area

will be delineated. A list of the specific plates is indexed for easy reader orientation. Plates are numbered in relationship to the individual appendix and specific chapter with which they are associated. (See also W74-00887 thru W74-00891) (Woodard-USGS)

SILICATE IN THE WATER OF THE BAY OF VIGO (IN SPANISH),
Instituto de Investigaciones Pesqueras, Vigo (Spain). Laboratorio de Investigaciones Pesqueras.
M. Lopez-Benito.
Invest Pesq, Vol 36, No 2, p 273-282, 1972, Illus, English summary.
Identifiers: Bays, Seasonal, *Silicates, *Spain (Vigo Bay).

A study was made of the silicate distribution during 1970, in a station of the Ria Vigo, Spain. A higher silicate concentration was observed in the area of Rande and the inlet of San Simon. In station 3, low values of silicate occurred from Feb. to April (2.5-4 micro M SiO2/1). From May to Aug. the values remained between 5 and 8 micro M SiO2/1. In Sept. and Oct. the values decreased again to 1.66 micro M SiO2/1. Finally, a sudden increase was observed (14-14.26 micro M SiO2/1) in Nov. and Dec.--Copyright 1973, Biological Abstracts, Inc.

CHANGES OF PLANT COMMUNITIES IN OVERGROWN BODIES OF WATER OF THE AMU-DARYA DELTA, (IN RUSSIAN),
M. T. Tadzhitdinov, and K. N. Butov.
Ekologiya. Vol 3, No 2, p: 64-68. 1972.
Identifiers: *Deltas, *Phragmites-Communis, Plant communities, *USSR (Amu-Darya delta), Willow.

The effect of change in the water regime on overgrowth of the Aralsk (USSR) basin is reported. The dominating factor or factors which contribute to this ecological problem is the formation of superficial young cane or reed (Phragmites communis Trin.) which can withstand temporary drowning and debris from the river. The willow also plays an important role; they can be found all over the delta, and with the cane and a number of other plants, they contribute to the overgrowth of the water-ways. The movement of the sea and its shore also contribute to the problem. A stepwise discussion of the various contributing factors such as depth of water and the name of the various plants is presented.--Copyright 1973, Biological Abstracts, Inc.

WETLANDS '73: TOWARD COASTAL ZONE MANAGEMENT IN LOUISIANA.
Louisiana Advisory Commission on Coastal and Marine Resources, Baton Rouge.

Annual report. March, 1973. 7 p, 4 append.

Descriptors: *Planning, *Coastal marshes, *Environmental effects, Wetlands, Ecosystems, Land use, Financing, Salinity, Erosion, Administration, Institutions, *Louisiana.
Identifiers: *Coastal zone management, Coastal Zone Management Act, Public participation, Federal assistance.

The Louisiana Advisory Commission on Coastal and Marine Resources is charged with developing a long term plan for the orderly development and management of the coastal zone. This task is becoming increasingly important because of the recent passage of the federal Coastal Zone Management Act which provides assistance for state management efforts and because Louisiana citizens are now showing great concern over several proposed projects in coastal zone areas. The report recommends that the state take full advantage of the federal act by providing funds to continue state planning efforts and that the state become a leader in coastal zone management programs. Discussed briefly are four elements of a coastal zone management program: (1) representation of diverse interest groups; (2) citizen involvement; (3) utilization of the best available scientific and technical assistance; and (4) intensive study and analysis of the coastal zone problems and opportunities. Some of the planning and management concepts and principles to be included in the programs are the delineation of environmental management units, the use of ecosystem approaches to analyze the natural processes involved, the restriction of certain land uses, the use of various control structures to prevent erosion and salt water intrusion, and the possible diversion of fresh water into the coastal areas to control salinity. FIVE YEAR EXTENSION FOR RESEARCH AND DEVELOPMENT, PUBLIC LAW 92-60 (FINAL ENVIRONMENTAL STATEMENT).
Office of Saline Water, Washington, D.C.
Available from the National Technical Information Service as EIS-AA-73-02 66-F $7.00 in paper copy, $1.45 in microfiche. February 12, 1973. 84 p, 1 append.

Descriptors: *Environmental effects, *Desalination, *Saline water, *Water resources development, Desalination, Water pollution sources, Water quality control, Economics, Water properties, Irrigation water, Water quality, Legislation, Use of water, Alternative water use, Competing use, Quality control, Federal government.
Identifiers: *Environmental Impact Statements.

This environmental impact statement concerns the five-year extension of research and development projects and programs to improve desalting technology in accordance with Public Law 92-60 (PL 92-60). The research and development projects and programs that will be carried out under PL 92-60 are not expected to affect the environment significantly. Operations at the test facilities have been reassessed and found to have no significant environmental effects. Facilities are monitored on a continuing basis to assess and to minimize environmental impact. Alternatives considered include surface water development, groundwater development, improved water management practices, weather modification to increase precipitation, and recycling of sewage treatment and industrial plant effluents to industrial, agricultural, and municipal uses. This five-year extension of the Saline Water Conversion Program will provide for the development and demonstration of practical means to convert saline water and other chemically contaminated water to a quality suitable for municipal, industrial, agricultural, and other beneficial uses. 3B. Water Yield Improvement

SAMPLING REQUIREMENTS FOR AREAL WATER EQUIVALENT ESTIMATES IN FORESTED SUBALPINE WATERSHEDS,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
C. F. Leaf, and J. L. Kovner.
Water Resources Research, Vol 8, No 3, p 713-716, 1972. 2 fig, 1 tab, 11 ref.

Descriptors: Coniferous forests, Mountain forests, Snow cover, Snow management, Snow surveys, Snowfall, Snowmelt, Snowpacks, *Water equivalent, Water yield, *Watershed management, *Colorado, *Forest watersheds.
Identifiers: *Snowpack sampling, Snow storage, *Subalpine watersheds.

Statistical analyses were made of the snow course measurements on a 714-acre forested subalpine watershed in central Colorado where melt rarely occurs during the winter snow accumulation season. The following guidelines were developed for sampling mountain snowpacks on an areal basis: (1) sampling zones should be stratified by elevation, the sampling in each zone being proportional, and (2) sampling points should be widely spaced over each zone, two duplicate measurements at most being made at a location. (Forest Service)
W74-00675

ANNUAL STREAMFLOW SUMMARIES FROM FOUR SUBALPINE WATERSHEDS IN COLORADO,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
C. F. Leaf, and G. E. Brink.
USDA Forest Service General Technical Report RM-1, 1972. 24 p.

Descriptors: *Colorado River Basin, Coniferous forests, *Demonstration watersheds, *Runoff, Snowmelt, Stream gages, *Streamflow, Surface waters, Hydrologic data.
Identifiers: Fraser Experimental Forest, *Subalpine watersheds.

Streamflow runoff summaries are presented for four experimental watersheds near Fraser and Steamboat Springs, Colorado. Interval of published record varies from 1943-71 at Fraser to 1967-71 at Steamboat Springs. (Forest Service)
W74-00676

WATER YIELD CHARACTERISTICS OF THREE SMALL WATERSHEDS IN THE NORTHEASTERN BLACK HILLS,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
H. K. Orr, and T. VanderHeide.
USDA, Forest Service Research Paper RM-100, February 1973. 8 p, 6 fig, 3 tab, 3 ref.

Descriptors: *Precipitation, *Water yield, Hydrology, *Watershed management, Evapotranspiration, Water yield improvement, Hydrogeology, Coniferous forests, Mountain forests, National Forests.
Identifiers: *Ponderosa pine forest, *Black Hills, Mountain watersheds.

Three small forested watersheds (217, 89, and 190 acres) on a laccolith in the northeastern Black Hills have yielded surface runoff equivalent to 7.12, 7.57, and 6.51 inches or 25, 27, and 23 percent of average annual precipitation, water years 1964-69 inclusive. Losses, assumed near the equivalent of evapotranspiration (stream gages are tightly sealed on bedrock) have averaged 21.1, 20.3, and 21.6 inches respectively. The greatest loss has occurred from the watershed having the greatest volume of timber per acre, the deepest soil, and the gentlest gradient. Timber is presently being harvested on one watershed for evaluation of the effects of such treatment on water yield and quality. (Forest Service)

THE EFFECT OF OVERSTORY REMOVAL UPON SURFACE WIND IN A BLACK SPRUCE BOG,
Forest Service (USDA), St. Paul, Minn. North Central Forest Experiment Station.
J. M. Brown.
USDA Forest Service Research Note NC-137, 1972. 2 p, 1 fig, 1 tab, 4 ref.

Descriptors: *Winds, *Meteorology, Microenvironment, *Watershed management, *Wetlands, Clear-cutting, Coniferous forests, Energy transfer, Evapotranspiration, Advection, *Minnesota, Bogs, Demonstration watersheds.
Identifiers: *Black Spruce canopy, Strip-cutting.

Wind passage was measured over a black spruce canopy, at the surface under the canopy, and in a clearcut strip in a northern Minnesota bog. During a 40-day period wind below the canopy was 10 percent of that above the canopy while the wind in the clearcut strip was 45 percent of the total above the canopy. Wind at the surface of the clearcut strip was of longer duration and greater velocity than under the black spruce canopy. (Forest Service)
W74-00688

EFFECT OF SNOW FENCE HEIGHT ON WIND SPEED,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
R. D. Tabler, and D. L. Veal.
Bulletin of the International Association of Scientific Hydrology, Vol XVI, No 4, p 49-56, December 1971. 5 fig, 1 tab, 7 ref.

Descriptors: Winds, *Windbreaks, *Wind velocity, *Shelterbelts, Snow cover, Blizzards, Snow management, Snowpacks, Watershed management.
Identifiers: *Snow fences, Snow drifting, Snow transport, Snow deposition, Blowing snow, Induced snow accumulation, *Snowdrifts.

Wind speeds were measured to windward and to leeward of vertical-slat snow fences 6, 8, 10, 12, and 16 ft tall. The down-wind measurements were made at distances of 2.5H, 5H, and 10H from the fence, where H is fence height. Speed measurements at various heights were integrated up to the height of the fence, and the percentage reduction in wind speed was calculated. Results indicated that total wind speed reduction was proportional to the 1.5 power of fence height. (Forest Service)
W74-00691

SOIL WATER DEPLETION BY A HARDWOOD FOREST IN SOUTHWESTERN WISCONSIN,
Forest Service (USDA), St. Paul, Minn. North Central Forest Experiment Station.
R. S. Sartz.
Soil Science Society of American Proceedings, Vol 36, No 6, p 961-964, 1972. 4 fig, 2 tab, 11 ref.

Descriptors: *Water yield improvement, *Vegetation effects, *Watershed management, Water balance, Clearcutting, Forest soils, Soil water, Field capacity, Soil water movement, *Wisconsin.
Identifiers: *Soil water depletion, *Hardwood forests.

Soil water depletion by cut and uncut forest on a north slope was measured for 3 years with a neutron meter. Depletion by the uncut forest began early in the growing season at all depths measured and continued at a nearly constant rate until leaf fall. Seasonal depletion in a 1.5 m soil mantle averaged 188 mm on uncut plots, 87 mm on clearcut plots, and 57 mm on plots without vegetation. The amount of depletion increased with mantle depth; thus cutting had a greater water-saving effect on deeper soils. Estimates of evapotranspiration by uncut forest agreed closely with empirical estimates of potential evapotranspiration. (Forest Service)
W74-00693

DESIGN OF A WATERSHED SNOW FENCE SYSTEM, AND FIRST-YEAR SNOW ACCUMULATIONS,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
R. D. Tabler.
In: Western Snow Conference, Billings, Montana, April 1971 Proceedings. Vol 39, p 50-55. 7 fig, 2 ref.

Descriptors: *Snow management, *Snowpacks, *Water yield improvement, *Windbreaks, Snow cover, Water yield, Watershed management, Streamflow, Snowmelt, Water conservation, Shelterbelts, Blizzards, Winds, Water sources, Water equivalent, Water balance, Snowfall, Water storage, *Wyoming.
Identifiers: *Snow fences, Induced snow accumulation, Blowing snow, Snow transport, *Snowdrifts.

Inducing snow accumulation with fences in areas with insufficient natural barriers can materially increase total snow storage by reducing sublimative losses of wind-blown snow. A method has been developed to estimate the amount of blowing snow available at a snow fence site, whereby sublimation loss is considered to be a linear function of transport distance. Using this approach to determine the optimum capacity of the fence system, a 12 1/2-ft-tall fence, 1300 ft long, was built on a 111-acre watershed in 1969. The first winter after building the fence, peak snowpack water-equivalent was increased about 70%. Predicted snowpack water-equivalent was 1.0 area-inch, while the actual was 1.7 area-inches--an increase of about 6.5 ac-ft. If the snow fence continues to maintain total snow storage about 7 ac-ft per year above 'normal' over the anticipated 25-year project life, the value of the additional stored water-equivalent would have to be about $37 per ac-ft to amortize the initial $6500 construction cost. (Forest Service)
W74-00695

PHOTOGRAMMETRIC DETERMINATIONS OF SNOW COVER EXTENT FROM UNCONTROLLED AERIAL PHOTOGRAPHS,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
A. D. Haeffner, and A. H. Barnes.
American Society of Photogrammetry Tech. Sess. Proc., p 319-340. 1972. 7 fig, 4 tab, 13 ref.

Descriptors: *Photogrammetry, *Remote sensing, *Aerial photography, *Snow cover, Rocky Mountain Region, *Colorado, Snow surveys, Streamflow forecasting, Hydrology, Small Watersheds.
Identifiers: *Rocky Mountains, Fraser Experimental Forest.

Efficient operation of water projects depends on the accuracy of streamflow forecasts. The accuracy of forecasts of snowmelt contribution to streamflow is improved if precise estimates of the areal extent of snow cover are available. A simple photogrammetric technique for determining the areal extent of snow cover from uncontrolled aerial photographs in mountainous terrain is described. A Wild STK-1 Stereocomparator with an attached digital card punch was used to delineate the snow areas and record the data. Since ground control was not available, only relative ground coordinates of the delineated areas could be computed from the parallax equation for overlapping vertical photographs. From these relative coordinates, a true snow cover percentage for the selected area was computed. Analysis of the technique revealed some operator judgment was required in deciding which snow patches to include and/or how detailed to delineate them. A maximum deviation of less than 4 percent of the mean resulted from the operator making repeated measurements on each of several stereo models containing snow cover ranging from 93 to 27 percent. FACTORS OF CHEMICAL FERTILIZATION IN SALINE WATER IRRIGATION: A REVIEW,
Negev Inst. for Arid Zone Research, Beersheba (Israel). Dept. of Plant Introduction and Ecology.
M. Twersky.
Dec. 1971. 35 p, 151 ref.

Descriptors: *Saline water, *Irrigation water, *Crop response, *Agricultural chemicals, Ions, *Bibliographies, Fertilizers, Brackish water, Salt tolerance, Nutrients, Soil profiles.

The object is to focus significant points in current literature on problems of increasing plant production in arid and semi-arid areas with fertilizer practices and the increasing use of brackish water sources in combination with other marginal inputs. Development of irrigation agriculture in such regions and the shortage of good quality water for irrigation has turned many planners to consider the use of saline water in irrigation technology. The response of crop production to brackish water irrigation cannot be separated from that of nutrient fertilization. Improved response of plants to fertilization depends greatly upon water management systems. The following points are discussed: Characteristics and management of water quality, Effect of saline water and fertilizers on physiochemical reactions in the soil profile, Crop reaction to fertilizer nutrients and salt tolerance, and the Application of predictive models. The advantage of analytical models for calculating these interactions is emphasized. (Paylore-Arizona)

ECONOMIC FEASIBILITY OF AN INTEGRATED COTTONWOOD PLANTATION UTILIZING A NUCLEAR POWER REACTOR,
Battelle-Pacific Northwest Labs., Teheran (Iran).
B. W. Cone.
Journal of Forestry, Vol 70, No 10, p 620-623, Oct 1972. 1 illus, 2 tab, 4 ref.

Descriptors: *Irrigation, *Water utilization, *Forest management, *Crop production, *Cooling water, *Nuclear reactors, Nuclear power plants, Hardwoods, Economic feasibility, Water types, Irrigated land, Water reuse.
Identifiers: *Cottonwood (or Populus deltoides), Wood, Chips.

The irrigation of cottonwood (Populus deltoides) plantations with cooling water from a nuclear power generator was evaluated financially. It was found to offer sufficient profit incentives for the establishment of experimental test plots designed to estimate crop yields resulting under different spray regimes and applied water volumes. A cottonwood plantation could become a self-paying complementary enterprise for a nuclear power station if it were to yield 1300 cu ft per acre of marketable wood chips. (Witt-IPC)

EFFECT OF DETERGENT APPLICATION ON THE GROWTH OF CORN,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agronomy.
J. N. Judy, D. C. Martens, and W. Kroontje.
Journal of Environmental Quality, Vol 2, No 2, p 310-314, April-June 1973. 7 tab, 1 fig, 18 ref. OWRR-A-041-VA (2).

Descriptors: *Detergents, Waste disposal, *Phosphorus, Boron, Sodium chloride, *Clay loam, Statistical methods, Sands, *Virginia, *Corn (Field), Enzymes, Soils, Water reuse.
Identifiers: *Sandy loam, Soil pH, Statistical analysis, Norfolk soil, Davidson soil.

A greehouse experiment was conducted to determine the effects of two detergents on the growth of corn (Zea mays L.) on Davidson clay loam and Norfolk fine sandy loam. A heavy-duty non-enzyme detergent (Bz) and a heavy-duty enzyme detergent (Tx) wereapplied to the soils in watering solutions at concentrations of 0, 20, 800, 1600, 4800, 8000, 10,000, 12,000, and 14,000 ppm. Stimulations in growth occurred on the Davidson soil that received the 1600 ppm Bz or the 800, 1600, 4800, and 8000 ppm Tx solutions and on the Norfolk soil that received the 800 ppm Tx solution. These stimulations were attributed to responses to P contained in the detergents. Yield decreases occurred on the Dat received solutions containing 8000 through 14,000 ppm Bz or 14,000 ppm Tx, and on the Norfolk soil that received solutions containing 1600 through 14,000 ppm Bz or 4800 through 14,000 ppm Tx. These yield decreases were attributed to soluble salt damage from the Na salts contained in the detergents on all treatments, except where Tx was applied to the Norfolk soil. In the latter case, specific Na salt effects could not be separated from general salinity effects. Plants grown on the Davidson soil were more tolerant to detergent applications than those grown on the Norfolk soil, probably because of the greater salt retention of the former soil. It was concluded that the changes in soil pH and B availability due to detergent applications were not responsible for the yield decreases in this study.

POLICY PLAN FOR DEVELOPMENT OF LANSING'S WATERFRONT.
Waterfront Development Board, Lansing, Mich.

April, 1973. 15 p.

Descriptors: *Planning, *Environmental effects, *Michigan, Water resources development, Urbanization, Natural resources, Land use, Social aspects, Administration, Economic impact.
Identifiers: Waterfronts, *Waterfront development, *Policy plan, *Lansing (Mich).

This report is Part III of the 'Plan for Development of Lansing's Waterfront'. Part I covers background including past and present waterfront proposals; Part II presents the analysis of trends, problems, and potentials for waterfront development. Recommendations based on the first two reports are presented in the form of goals, policies, and actions related to seven specific components of development: natural features, land use, transportation, economy, social issues, health issues, and governing bodies. The basic goals of the policy plan are to make the city a better place to live, to improve the image of the waterfront, to promote people oriented land uses on the waterfront and to encourage cooperation among adjacent units of government. Some of the policies include the encouragement of public access to the waterfront, the provision of waterfront areas for use by diverse groups of people, the provision of recreation and amenity potentials, the cooperation with businessmen and landowners to promote sound development, and the education of the public on the nature of waterfront areas. A REPORT UPON WEST CENTRAL MARICOPA COUNTY, ARIZONA: VOLUME I, A STUDY OF PHYSICAL ENVIRONMENTAL FACTORS AS A BASIS FOR LAND USE PLANNING.
Maricopa County Planning and Zoning Dept., Phoenix, Ariz.

October, 1971. 53 p, 11 fig, 4 tab, 46 ref, 3 append.

Descriptors: *Planning, Water resources development, Geology, Physiographic provinces, Topography, Soils, Drainage, Floodplains, Irrigation, Groundwater, *Arizona, Subsidence, Hydrogeology, Urbanization.
Identifiers: *Environmental inventory, Salt River (Ariz), *Maricopa County (Ariz).

Environmental conditions in the study area, a 342 square mile area immediately west of Phoenix, are not unique insofar as the whole Salt River Valley is concerned. Factors evaluated include geology, physiographic processes, topography, soils, drainage, floodplains, geohydrology, subsidence due to groundwater withdrawal, irrigation, groundwater recharge, potential water sources, and water quality. Limitations to development result from drainage, water supply, and wastewater disposal. Waste usage is estimated at 556,200 acre-feet annually. The area's 50,000 people use only 11,200 acre-feet, while the remainder is consumed by irrigation. Average annual water input is only 326,900 acre-feet. The deficiency of water is obtained by depleting groundwater reserves. At present depletion rates groundwater will be exhausted by 2010. Two possible potential sources of water are the Central Arizona Project, which could provide 35,000-100,000 acre-feet annually and intensive use of wastewater effluents, which could provide 80,000-150,000 acre-feet. Water from any new sources will need more treatment than water now used, but treatment is said to be within reasonable economic limits. Maps, tables, and charts supplement the text. Land use planning based on this evaluation is discussed in Volume II. (Stein-North Carolina)

PRESENT AND FUTURE WATER USE AND ITS EFFECT ON PLANNING IN MARICOPA COUNTY, ARIZONA,
H. J. Thiele.
Prepared in cooperation with Maricopa County Planning and Zoning Department, Phoenix, Arizona. September, 1965. 59 p, 20 fig, 28 tab, 41 ref.

Descriptors: *Planning, *Water demand, *Water supply, *Forecasting, *Arizona, Groundwater mining, Water resources, Irrigation, Hydrogeology.
Identifiers: *Maricopa County (Ariz), Salinization, Phoenix (Ariz), Salt River (Ariz).

Because land use plans should consider water resources and their ability to serve a basin area, water supply and need in the metropolitan Phoenix portion of Maricopa County are analyzed. Three basic components of the study were a wateruse study, a water-resources study, and a water-utilization-potential study. Horizons for projections were 1980 and beyond. In 1963 almost 3 million acre feet of water were used annually in the metropolitan area, 88% being used for irrigation at an average rate of 4.84 acre-feet per acre of land annually. Over 100,000,000 acre-feet of groundwater lay beneath Phoenix but 1.3% was depleted that year. Consumptive use of 2.2 million acre-feet added 1.8 million tons of salt to underground reserves. Continued population increases in Phoenix are accompanied by declining potential for irrigating land. Water need decreases as irrigated land leaves productivity. Groundwater reserves decrease, however, until 2020 when use of the remaining 39 million acre-feet should be frozen until emergency needs dictate. The report forecasts 1.8 million people in the Phoenix area in 1980 and 3.2 million ultimately. Water demand at delivery points in 1980 will be 2.2 million acre-feet, less than in 1963, while ultimate demand at delivery points will be 1.8 million acre-feet, assuming no irrigation. It is estimated that the Salt River Project, Central Arizona Project, and reuse of treated effluent will be able to meet water demands indefinitely. Maps, charts and tables supplement the text. IMPROVING WATER ECONOMY OF A NORTHERN KRAFT BLEACH PLANT,
B. E. Werenskiold.
Paper Trade Journal, Vol 156, No 42, p 43-45, Oct 9, 1972. 4 fig.

Descriptors: *Water consumption, *Industrial water, *Pulp and paper industry, Temperature, Freshwater, Water types, Systems analysis, United States, Steam.
Identifiers: Kraft mills.

A systems engineering study of an integrated bleached kraft pulp, paper, and board mill in a northern U.S. location is reported. Its aim was to reduce water consumption under widely varying fluctuations in freshwater temperature. The mill's water input between the high-density brown-stock storage and the bleach plant thickener varied originally between 44,000 and 63,000 gal/ton of bleached pulp. The process changes adopted as a result of this study reduced this to less than 15,200 gal/ton. Further recommendations are made, aiming at a target input of 10,000 gal, with corresponding savings in direct steam demand of about 2,100,000 Btu/ton. (Witt-IPC)

WHEAT RESPONSE TO SOIL MOISTURE AND THE OPTIMAL IRRIGATION POLICY UNDER CONDITIONS OF UNSTABLE RAINFALL,
Hebrew Univ., Jerusalem (Israel).
D. Yaron, G. Strateener, D. Shimshi, and M. Weisbrod.
Water Resources Research, Vol 9, No 5, p 1145-1154, October 1973. 2 fig, 6 tab, 17 ref.

Descriptors: *Irrigation efficiency, *Soil moisture, *Rainfall, *Stochastic processes, *Simulation analysis, *Decision making, *Optimum development plans, Computer models, Estimating, Irrigation practices, Crops, Water management (Applied), Systems analysis, Risks.
Identifiers: *Wheat yield, Irrigation policy.

Presented is a method for estimating a response fuction of wheat yield to soil moisture and for determining the optimal irrigation policy nunder conditions of stochastic rainfall. To determine such policy, information on the variation of the soil moisture over time as a function of depth is needed: A low-cost, computer simulation, soil moisture estimation model designed to reconstruct the soil moisture fluctuations (during the growing season of wheat) on the basis of incomplete data is described. Then, empirical estimates of the response function of wheat yield derived on the basis of a four-year irrigation experiment are presented; use is made of the Mitscherlich function. For the problem of deriving the optimal irrigation policy under conditions similar to those in the experiment (unstable rainfall), the soil moisture estimation model and the estimate of the Mitscherlich response functinons have been applied in an analysis in which the rainfall record representing the random rainfall distribution at the experiment site for a period of 16 years is taken into account. Two approaches to irrigation decision are considered, and several irrigating policies derived from the approaches are compared by simulating their consequences in relation to the 16-year rainfall record. JOJOBA AND ITS USES, AN INTERNATIONAL CONFERENCE, JUNE 1972.

University of Arizona, Office of Arid Lands Studies, Tucson, Arizona, June 1972. 81 p, 32 fig, 5 tab, 45 ref.

Descriptors: *Desert plants, *Xerophytes, Seeds, Seed treatment, *Planting management, Runoff, Plant populations, Crop production, Economic feasibility, Plant morphology.
Identifiers: *Jojoba, Liquid wax, Plant uses, Simmondsia chinensis.

Papers delivered at this first international conference on jojoba Simmondsia chinensis and its uses covered its distribution, chemistry of the seed, problems in the collection of seeds, and production under cultivation. Included were historical summaries and presentations of new research, especially in Israel, that will provide a basis for future developments. Experiments with planting, seed production potential, saponification and gas chromatographic analysis of jojoba wax esters, preparation of jojoba products, the effect of runoff farming for increased yields, and the need for additional agronomic and toxicity studies are discussed. The physical characteristics of the plant and its products are described, and the field experience with native stands in Arizona is delineated. The possibilities for commercial production as an Indian industry are shown. While enough seed may be collected from native stands for laboratory experiments, large-scale commercial use of its products will require plantations, such as have succeeded in Israel, and further research of jojoba as a horticultural plant, by determining desirable genetic prototypes and variability factors is needed. As an arid-lands plant requiring very little water even in its cultivated state, and one with great economic possibilities, it deserves attention. (Paylore-Arizona)

EMERGENCE OF BUFFEL GRASS (CENCHRUS CILIARIS) FROM SEED AFTER FLOODING,
Department of Primary Industries, Mackay (Australia). Agricultural Branch.
E. R. Anderson.
Queensl J Agric Anim Sci. Vol 29, No 3, p 167-172. 1972.
Identifiers: *Buffel grass, Cenchrus-Ciliaris, *Flooding (Plants), Grasses, Seeds.

The emergence of 7 buffel grass cultivars after simulated flooding for 0, 10, 20, 30 and 40 days in pots was investigated. Seed of known germination was planted in an alluvial clay soil of medium to heavy texture and flooding imposed immediately. Seedling emergency did not occur until flooding ceased, and emergence took longer in flooded treatments than in the control. Flooding caused a marked reduction in seedling emergence. The ability of the buffel grass cultivars to emerge was in the following order: American and Boorara greater than Biloela, Nunbank and Tarewinnabar greater than Gayndah and Molopo. The last 2 cultivars failed or had negligible emergence in all flooding treatments.--Copyright 1973, Biological Abstracts, Inc.

ADAPTABILITY OF MAIZE TO HIGH SOIL WATER CONDITIONS,
Indian Agricultural Research Inst., New Delhi. Div. of Agricultural Physics.
D. K. Das, and R. L. Jat.
Agron J, Vol 64, No 6, p 849-850, 1972.
Identifiers: Adaptability, *Aeration, Furrows, *Maize, Porosity, Ridges, *Roots, *Soil water, Zea-mays.

Maize (Zea mays L.) plants were grown in furrows and ridges in a lowlying sandy clay loam soil under high soil-water conditions. Root porosities of 44-day-old plants were studied. The investigation was

undertaken to determine varieties that could adjust to such environment through internal aeration. Varietal differences were found in the percentage of air space of roots. Plants grown in furrows had higher root porosities than those grown in ridges. Six cultivars studied were 'Kissan,' 'Deccan,' 'Jawahar,' 'Ganga 5,' 'Vikram' and 'Sona.' The first 2 may adjust better to excess soil water due to greater internal aeration resulting from increased root porosities.--Copyright 1973, Biological Abstracts, Inc.

EFFECTS OF WATER AND HEAT ON SEEDLING EMERGENCE,
Institute for Land and Water Management Research, Wageningen (Netherlands).
R. A. Feddes.
J Hydrol (Amst). Vol 16, No 4, p: 341-359. 1972, Illus.
Identifiers: Bean, Beet, Gardens, Heat, Irrigation, *Moisture, Radish, Rainfall, *Seedling emergence, Soils, Spinach, *Temperature, Water, *Germination.

The combined effect of soil temperature and moisture content on seedling emergence was studied with 4 different kinds of vegetable seeds radish, spinach, broad bean and garden beet, in field experiments in a clay and a sandy loam profile, both with a shallow and a deep groundwater table. Various sowing dates were applied. The mean daily temperatures of the plots with the higher groundwater tables were 1-2C lower than the temperature of the plots with the deeper groundwater tables. With the same groundwater depth, clay was warmer than sandy loams. The difference in groundwater level play a more important role than the difference in type of profile. The maxima and minima in the top soil were higher and the amplitudes decreased with depth faster in soils which had a deep groundwater table. The decrease was more marked in the clay than in the sandy loam soil. Seeds emerged earlier in sandy loam than in clay. The sandy loam plots with the shallow groundwater table showed the highest emergence rate as well as the highest total emergence percentage. The mean heat sums required for 50% emergence were lower on sandy loam than on clay, and the heat sums of the shallow groundwater plots were lower than those of the deep groundwater plots. The heat sum required for 50% emergence increased sharply below a matric pressure of -0.49 bar (above pF (water holding index) 2.7) of the soil. For a fast and adequate seedling emergence both a high temperature and a sufficient moisture content are necessary. By sprinkler irrigation the sowing bed can be kept at the desired moisture content.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF RETARDANT CHLOROCHOLINE CHLORIDE ON CONTENT OF PROTEIN COMPONENTS IN PLANT LEAVES DURING DROUGHT (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Inst. of Plant Physiology.
N. N. Kharanyan.
Dokl Akad Nauk Sssr Ser Biol, Vol 205, No 2, p 492-494, 1972.
Identifiers: Bean, Chlorides, *Chloro choline chloride, Drought, Leaves, *Protein, Retardants, Wheat, *Amino acids.

Experiments with wheat and bean plants showed that the protein content in leaves of plants pretreated with chlorocholine chloride (CCC) during a drought is higher than in plants subjected to drought without CCC treatment (controls). The total quantity of free amino acids in the CCC-treated plants is lower than in the control plants. This fact may indicate a decrease of the breakdown of proteins in leaves of the CCC-treated plants under drought conditions, whereas protein breakdown and an increase of the content of amino acids are usually observed under these conditions.--Copyright 1973, Biological Abstracts, Inc.
W74-00996

EFFECT OF GROWTH REGULATORS ON WATER METABOLISM IN PLANT: I, IAA, TIBA (2,3,5-TRIIODOBENZOIC ACID), GA (GIBBERELLIC ACID) AND CCC (2--CHLOROETHYLITRIMETHYLAMMONIUM CHLORIDE) ON HYDRATION OF TOMATO LEAVES AT VARIOUS S OIL MOISTURE CONTENTS, (IN POLISH),
Nicolas Copernicus Univ. of Torun (Poland). Pracownia Fizjologiczny Roslin.
A. Chrominski.
Zesz Nauk Uniw Mikolaja Kopernika Toruniu Nauki Mat-Przyr Biol. 14 p 189- 207. Illus, 1972. (English summary).
Identifiers: Benzoic acid, Gibberellic acid, *Growth regulation, Hydration, Leaves, *Metabolism, Osmotic potential, Soil moisture, *Tomato leaves.

CCC and IAA treatments decreased osmotic potential; TIBA increased it-it decreased leaf hydration. The intensity of IAA and TIBA action and the direction of changes resulting from the application of GA were dependent on soil moisture content. (See also W74-01027)--Copyright 1973, Biological Abstracts, Inc.
W74-01026

EFFECT OF GROWTH REGULATORS ON WATER METABOLISM IN PLANT: II. IAA, TIBA (2,3,5-TRIIODOBENZOIC ACID), GA (GIBBERELLIC ACID) AND CCC (2--CHLOROETHYLTRIMETHYLAMMONIUM CHORIDE) ON TRANSPIRATION RATE AND STOMATAL APERATURES O F INTACT TOMATO PLANTS, (IN POLISH),
Nicolas Copernicus Univ. of Torun (Poland). Pracownia Fizjologiczny Roslin.
A. Chrominski.
Zesz Nauk Uniw Mikolaja Kopernika Toruniu Nauki Mat-Przyr Biol. 14 p 209-228. Illus, 1972, (English summary).
Identifiers: Benzoic acid, Gibberellic acid, Growth regulation, *Metabolism, Soil moisture, *Stomatal aperatures, *Tomato, *Transpiration rate.

IAA, TIBA and CCC decreased, while GA increased, the transpiration rate. IAA and TIBA statistically significantly decreased stomatal aperatures. CCC insignificantly increased the stomatal apertures at low (25%) soil moisture and reduced the width of the stomata at normal (55%) soil moisture content. The effects of GA on behavior of the stomata were opposite to those of CCC. (See also W74-01026)--Copyright 1973, Biological Abstracts, Inc.
W74-01027

VARIATION IN SOIL FACTORS AND CROP YIELD ON A SANDY SOIL RICH IN ORGANIC MATTER, (IN NORWEGIAN),
O. Prestvik.
Meld Nor Landbrukshogsk. Vol 51, No 10, p 1-10, 1972. (English summary)
Identifiers: *Humus, *Organic matter, *Sandy soil, *Crop yield, Cation exchange, Soil chemistry.

In a coarse textured sand with humus content of 9-22% by weight in the upper layer, the water content and cation exchange capacity were positively correlated with humus content. Soil pH, soluble P and the degree of base saturation seemed to be negatively correlated with the content of organic matter. To a certain degree the crop yield varied in the same manner over the field from year to year. The yield was positively correlated with the humus content of the soil and also with other soil factors bound to the humus content. About 3/4 of the total variation in relative yield on an average for the period 1947-1951 could be explained by humus content and depth of the layer rich in humus: relative yield ± 62.11 + 1.78 loss of ignition (%) + 0.40 depth of upper layer rich in humus (cm). The content of organic matter partly reflects the production of plant mass. A good supply of water keeps the humus content high, resulting in high crop yield.--Copyright 1973, Biological Abstracts, Inc.

MOISTURE EXPENDITURE BY FOREST AND FIELDS IN THE PROTECTIVE AFFORESTATION REGIONS, (IN RUSSIAN),
A. I. Mikhovich, Ya. K. Zarudny, and V. E. Popova.
Lesovod Agrolesomelior Resp Mezhved Temat Nauchn Sb. 20. p 113-119. 1970.
Identifiers: Forests, Forestation, *Moisture, *Oak, *USSR (Ukranine), Agriculture, Soils.

Observations on moisture expenditure by forest stands and fields occupied by agricultural crops were conducted by the Ukrainian Scientific Research Institute of Forestry and by experimental stations in the Sumy, Donetsk, Voroshilovgrad (now Lugansk), Kirovograd, Kherson, Nikolaev and Vinnitsa regions of the Ukrainian SSR. Information is presented on the working methods, the characteristics of stands (age, height of stands, degree of stand closure) and of agricultural fields, with an indication of the field crop and the yield, as well as data on the total moisture expenditure by forest strips and fields. In the forest steppe and steppe of the Ukraine, it was established that the total moisture expenditure during the growing season by the young and middle-aged oak stands (in masses and in strips) is, as a rule, higher than the expenditure of the agricultural crops usual in these regions. In the 3-m thick layer of soil under forest strips and masses, less moisture was contained, as a rule, than in the neighboring field plots, though the spring reserves of soil moisture were almost equal to or even higher under forest.--Copyright 1973, Biological Abstracts, Inc.

04. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control of Water on the Surface

TRAVEL TIME OF GEORGIA STREAMS,
Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
A. M. Lumb.
Available from the National Technical Information Service as PB-224 848, $4.25 in paper copy, $1.45 in microfiche. Environmental Resources Center, Georgia Institute of Technology, Atlanta, Report ERC-1273, Sept. 1973. 80 p, 20 fig, 21 tab, 13 ref, 5 append. OWRR A-042-GA (1). 14-31-0001-3810.

Descriptors: *Natural streams, *Time, *Tracers, Dye releases, Time of concentration, Hydraulic properties, Streamflow, Flow measurement, Flow rates, Open channel flow, Discharge measurement, Backwater, Mannings equation, *Georgia, Computer programs, Path of pollutants.
Identifiers: *Average velocity, Stream velocity.

Estimates of the time of travel of flow in natural streams are important to the hydrograph routine necessary for the planning and operation of flood control systems and to the routing of pollution movement needed for water management programs. Such estimates are particularly important when reacting to accidental spills that can contaminate downstream water supplies. This study develops, through multiple regression analysis of data on Georgia streams, prediction equations more accurate than current office approximations and less costly than tracer or other field studies. Data from discharge measurements by the US Geological Survey at 145 complete record stations in Georgia were used with the Biomedical Computer Program, BMD02R, entitled 'Stepwise Regression.' Equations were developed for estimating average stream velocity, depth, width, and cross-sectional area from drainage area, mean basin elevation, mean annual precipitation, discharge and discharge frequency as the independent variables. Comparisions were made between travel times predicted from the equation for average stream velocity and travel times measured from dye-tracer studies. From the limited data available, it appears the equation for average velocity tends to underestimate travel times at high flows and over-estimate travel times at low flows. Only data for the north central and northwestern portions of Georgia were available for comparison.

Identifiers: European USSR, *Ukraine, *Moldavia, Carpathian Mountains, Dnieper River, Dniester River, Storm precipitation, Traveltime, Nomograms.

Information is provided on formation and regulation of spring and storm runoff on rivers in the Ukraine and Moldavia. Procedures used to compute flood-wave movement in Dnieper River reservoirs are described in connection with the 75-year flood which occurred on the Lower Dnieper between Kiev and Kakhovka in the spring of 1970. Flood data obtained from catastrophic floods in the Dniester, Prut, Seret, and Tisza River basins in the Ukrainian Carpathians in June 1969 and May 1970 are analyzed to define and interpret flood profiles. Storm-precipitation patterns in irrigated regions of southern European Russia are examined, and methods are presented for performing snowmelt and spring-runoff computations and for preparing a short-term forecast of daily water discharges of the Dnieper River at Kiev. (See W74-00593 thru W74-00601) (Josefson-USGS)

Descriptors: *Flood flow, *Flood waves, *Flood routing, *Flood discharge, *Reservoirs, Flood stages, Stage-discharge relations, Channels, Hydrographs, Water storage, Reservoir storage, Inflow, Water balance, Gaging stations, Computer programs, Curves, Equations.
Identifiers: USSR, *Dnieper River.

Procedures for calculating flood-wave movement along the cascade of reservoirs on the Dnieper River were based on methods of flood routing in individual river reaches and large reservoirs. Flood routing in a river involves solutions of water-balance equations for reaches in which average time of water movement approximates duration of the design time interval (day), with allowance made for change in channel storage. Flood routing in a large reservoir is reduced to a determination of its daily water balance with consideration for change in dynamic capacity depending on outflow stage and discharge. Computation of the movement of a flood wave from inlet gaging stations of the Dnieper Cascade (Mozyr' on the Pripyat', Rechitsa on the Dnieper, Gomel' on the Sozh) to Kakhovka includes calculations of the transformation of average daily water discharges in 16 river reaches and 5 reservoirs, performed with allowance for lateral inflow and reservoir operation during a flood period. A program was prepared for the EVM M-220 computer according to procedures proposed; calculations were made of flood wave movement in 1965-69; and estimates are given of the reliability of results. (See also W74-00592) (Josefson-USGS)

In: Formirovaniye, raschety i regulirovaniye rechnogo stoka; Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 100, p 69-74, Moscow, 1971. 1 fig, 1 tab, 7 ref.

Descriptors: *Runoff, *Spring, *Rivers, Tributaries, Watersheds (Basins), Hyposometric analysis, Precipitation (Atmospheric), Snowmelt, Water equivalent, Antecedent moisture content, Freezing, Curves, Equations.
Identifiers: USSR, *Carpathian Mountains, *Dniester River.

The relation of average depth of total spring runoff on Carpathian tributaries of the Dniester River to average basin elevation is local in character. Spring runoff on Carpathian rivers is determined mainly by snow storage and liquid precipitation occurring during the period of runoff formation. The negligible effect of antecedent moisture content and soil freezing on spring runoff during the period examined (1947-67) is attributable to their small variability from year to year. ALGORITHM FOR SOLVING A CLASS OF LINEAR PROGRAMMING PROBLEMS RELATED TO RESERVOIR MANAGEMENT AND DESIGN,
Universidad Nacional del Sur, Bahia Blanca (Argentina).
R. Alemany, P. Fernandez, and A. G. De Pousa.
Water Resources Research, Vol 9, No 5, p 1227-1234, October 1973. 6 tab, 4 ref.

Descriptors: *Linear programming, *Algorithms, *Reservoirs, *Management, *Design, Decision making, Equations, Mathematical models, Systems analysis.
Identifiers: *Argentina (El Chocon Reservoir), Argentina (Limay River).

Detailed description is given of an algorithm for easily solving (by hand computation) a class of linear programming problems related to the use of the 'linear decision rule' in reservoir design and management. The method clarifies some theoretical aspects of the practical problem. For purposes of illustration, the algorithm is applied to the El Chocon Reservoir in southwestern Argentina. There has been interest in developing a quick and flexible method of calculation for discussing management alternatives for this reservoir, which has a planned capacity of 20,170 hm and contemplates both a power output of 1,2000,000 kw and an irrigated capacity for 625,000 ha. (Bell-Cornell)

OPTIMIZATION MODEL FOR THE OPERATION OF FLOOD CONTROL SYSTEMS,
Natal Univ., Durban (South Africa). Dept. of Civil Engineering.
J. S. Windsor.
Water Resources Research, Vol 9, No 5, p 1219-1226, October 1973. 4 fig, 10 ref.

Descriptors: *Reservoir operation, *Flood control, *Linear programming, *Optimization, Reservoir storage, Reservoir releases, Costs, Flood damage, Downstream, Evaluation, Forecasting, Stochastic processes, Methodology, Mathematical models, Systems analysis.
Identifiers: *Cost minimization, Hydrometeorological conditions.

Recursive linear programming is used to determine the optimal operation of a system of flood control reservoirs. The system is operated over a number of discrete time periods, and the optimization model is used to determine the operating policy that minimizes the downstream damage costs associated with the magnitude of reservoir releases. The method recognizes component interaction in space and time. By dividing the flood period into shorter operational periods it is shown how the system policies may be adjusted to incorporate the latest forecast information and thus ensure maximum flexibility under actual operating conditions; using a series of sequentially-related linear programming routines to cover the entire flood period, the inputs to the model are adjusted at each time stage to reflect the changing storage and hydrometeorological conditions. It is assumed that decisions regarding the number, location, and size of the individual reservoirs in the system have previously been made. (Bell-Cornell)

Identifiers: *Cost minimization, *Nonlinear programming, Separable programming, *Minnesota River basin.

Optimization techniques are proposed for selecting the best sites for construction of a system of multi-purpose reservoirs that will most economically meet the various water demands. The objective function minimizes the sum of the annual amortized cost of the reservoirs and the annual flood shortage losses less the annual recreational benefits. The problem is formulated using nonlinear programming and has the advantage of being separable into variables, both in the objective function and in the constraints. It is finally reduced to a linear programming problem by substituting the nonlinear relationships with piecewise linear approximations. Employed is the common approximate approach to the problem, which chooses the optimal design parameters on the basis of straight historical inflow data for a specified period. The optimization considers the flood inflows (based on a given flood frequency) and the drought inflows (based on the severest drought on record) simultaneously. Releases are constrained only by the availability of water, and their optimal values are determined by balancing damages downstream against the cost of providing storage to prevent them. The model is applied to U.S. Army Corps of Engineers data for the Minnesota River basin, and the results are compared with the plan proposed by the Corps. (Bell-Cornell)

releases, Discharge (Water), *Drawdown, Management, Optimization, Costs, Design, Systems analysis, Economics, Recreation, Water supply, Streamflow, Rivers, Constraints, Mathematical models, Reservoir capacity.
Identifiers: *Discharge policy, *Operating policy, *Riviere du Nord (Quebec-Canada), Chance-constrained programming, Screening, Cost minimization.

For existing reservoirs an efficient policy implies maximization of the magnitude of the streamflow guaranteed at a given reliability level. Using a linear programming screening model, the discharge policy for a network of eight small existing reservoirs utilized for recreational activities and for water supply of a city downstream of the network is determined. The optimization problem is formulated by employing a linear operating rule, and chance-constrained programming is adopted to account for the stochasticity of the inflows. Two objective functions are introduced to study the cost of a more 'equitable' distribution of the losses due to surface drawdowns versus the most 'efficient,' which minimizes the total summation of the individual drawdowns; comparison of the solutions leads to quantification of the additional cost that society has to pay for a discharge policy that is equitable rather than efficient. A case study on the Riviere du Nord, Quebec, Canada is presented. Results show that the linear operating rule is valid for existing reservoir analysis; observed also is that chance-constrained programming may have serious ineptitudes for design purposes and for analysis of large existing reservoir networks. The approach, however, is a desirable management tool for systems of small reservoirs, primarily as a screening model. (Bell-Cornell)

FLOW AND CHANNEL CHARACTERISTICS OF TWO HIGH MOUNTAIN STREAMS,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
B. H. Heede.
USDA Forest Service, Research Paper RM-96, October 1972. 12 p, 9 fig, 5 tab, 11 ref.

Descriptors: Hydraulics, *Open channels, *Channel morphology, *Channel flow, Hydraulic properties, *Slope stability, *Discharge (Water), Regime, Reynolds number, Froude number, Turbulent flow, Transition flow, Colorado.
Identifiers: *Mountain streams, *Hydraulic geometry, Step formation, Bed material movement, Floodplain forest management, Channel shape, Sediment movement.

Steps provided by logs fallen across the channel added to flow energy reduction. The streams required an additional number of gravel bars to adjust to slope. Average step length between logs and gravel bars are strongly related to channel gradient and median bed material size. More bars formed when fewer numbers of logs were available. Although these are 'rushing mountain streams,' most values for flow velocities ranged between 0.5 and 2.5 feet per second. Exponents of functions expressing rate of change of depth or velocity, respectively, with discharge, indicated that dynamic stream equilibrium was attained. Implications for forest management are that sanitation cuttings (removal of dead and dying trees) would not be permissible where dynamic stream equilibrium exists and bed material movement should be minimized. (Forest Service)

PRELIMINARY RESULTS OF WATER LEVEL CONTROL ON SMALL PLOTS IN A PEAT BOG,
Forest Service (USDA), St. Paul, Minn. North Central Forest Experiment Station.
D. H. Boelter.
In: Proceedings Fourth International Peat Congress, Helsinki, Finland, June 25-30, 1972. I-IV, p 347-354. 3 fig, 6 ref.

Descriptors: *Organic soils, *Controlled drainage, *Evapotranspiration, *Subsidence, Microclimatology, Wetlands, Peat, Bogs, Water table, Hydrologic properties, *Minnesota, Watershed management, Demonstration watersheds.
Identifiers: *Water level control, Wetland hydrology, Peatlands, Bog vegetation, *Peat bogs.

Bottomless metal tanks driven into the organic soil were used to study the effect of water level control in a peat bog. Water levels were maintained at depths of 0.0 m., 0.3 m., and 0.6 m. The two lower water levels resulted in subsidence of 3.5 to 6.0 cm. in 2 1/2 years, due primarily to settling of the undecomposed surface peat material as water was drained from it. By contrast, the surface elevation in high water level plots rose 6.0 to 9.0 cm. due to the rapid growth of sphagnum moss. Sedges and cotton grass became more dominant in high water level plots. Labrador tea became the most prominent vegetation in the low water level plots and spagnum moss dried up. Evapotranspiration in the low water level plots was estimated to be less than half of that in the high water level plots. The lower evapotranspiration is attributed primarily to the reduced evaporation by sphagnum mosses. (Forest Service)

MALEZAS ACUATICAS, AQUATIC WEEDS, J. M. BRISTOW,
Colombian Agricultural Inst., Bogota.
J. M. Bristow, J. Cardinas, T. M. Fullerton, and J. Sierra.
1971. 116 P. 55 PHOTOS, 24 REF.

Descriptors: *South America, *Systematics, *Aquatic weeds, Floating plants, Submerged plants, Rooted aquatic plants, Habitats, Climatic zones, Aquatic plants.
Identifiers: *Colombia (South America), Plant propagation, Dissemination, Emergent plants.

The serious economic problem of aquatic weeds in Colombia, South America, becomes more acute with construction of new irrigation systems and reservoirs. With increasing contamination of canal waters by run-off of agricultural fertilizers and sewage, the problem is likely to become worse. In order to formulate suitable measures for the chemical control of these weeds, it is essential to know the species or at least the genera. Pictured in color are 55 common species which permit easy visual identification. The classification and a simple description of each species is given, together with their habitats, the climate in which each is found, and their modes of propagation. Dispersion may be by water or by birds. Mna has been responsible for the world dissemination of some of the most noxious aquatic weeds such as Eichhornia, Salvinia, Elodea, Hydrilla, and Alternanthera. (Jones-Wisconsin)

SHORELINE MANAGEMENT INVENTORY.
Renton Planning Dep., Wash.

October, 1972. 52 p, 10 fig, 15 tab, 4 append.

Descriptors: *Shores, *Washington, Shore protection, Lake shores, Planning, Land use, Land tenure.
Identifiers: *Shoreline management, Environmental inventory, *Seattle (Wash), Lake Washington.

An inventory is presented of natural characteristics of shorelines in the Seattle suburb of Renton, as required by the State of Washington's Shoreline Management Act of 1971. Portions of shoreline on Lake Washington, Cedar River, Green River, Black River, Springbrook Creek, and May Creek in the inventory extend to an area at least 500 feet from ordinary high water marks of these shorelines. Items noted include existing land and water uses, generalized land ownership patterns, river and lakeshore classifications, mineral resources, water level fluctuation, characteristic animals, soil types and capabilities, characteristic vegetation, and almost 6.5 miles of shore defense works. Shore-related plans and programs are summarized; public plans include construction of a channel to minimize flood damage in an industrial area, relocation and widening of a creek, a link in a Cedar River Trail System, a regional park along May Creek, improvement of a lakefront airport, and expansion of Lake Washington Beach Park. There are private plans for a commercial-recreational development on 60 lakefront acres. Proposed capital improvements for 1973-1978 are mapped. (Stein-North Carolina)

CORONADO RESOURCE CONSERVATION AND DEVELOPMENT PROJECT, PROGRAM OF ACTION.
Soil Conservation Service, Phoenix, Ariz.

May 1973. 133 p, 7 map, 13 tab, charts.

Descriptors: Natural resources, *Conservation, *Water resources, *Land use, *Project planning, Governmental interrelations, *Arizona, Recreation, Wildlife, Irrigation, Surveys, Resources development.

The project area is bounded by Mexico on the south and New Mexico on the east. It has a land area of nearly 9 million acres, of which 27 percent is privately owned, 38 percent federally administered, 24 percent state owned, and 11 percent Indian reservations, all lying within four counties. Of a total population of nearly 100,000, over 42 percent live in rural areas, with only two communities of more than 10,000 persons. The Program of Action presented is an effort to outline problems, opportunities and actions that will be taken to conserve, improve, and develop the resources of this 4-county project area. Surface water is scarce because of generally low rainfall, and irrigation water for the 230,000 acres in irrigated farmland comes from pumped deep wells. Because of a falling water table, project measures are proposed to achieve more efficient use of irrigation water by improving delivery systems and accelerating technical assistance for water management. The socio-economic, natural, agricultural, and recreation resources of the area are detailed, including climate, geology, minerals, ground and surface water, watershed, and soils, along with cropland and major plant communities. Supporting maps and tables show land ownership, annual precipitation, irrigated and urban lands, wildlife habitats, and watershed inventories. A short term plan for fiscal 1974 is appended. THE TIDAL POWER POTENTIAL OF UNGAVA BAY AND ITS POSSIBLE EXPLOITATION IN CONJUNCTION WITH THE LOCAL HYDROELECTRIC RESOURCES,
Department of the Environment, Ottawa (Ontario). Marine Sciences Branch.
G. Godin.
Manuscript Report Series No 30, 1973. 78 p, 20 fig, 7 tab, 11 ref.

Descriptors: *Water resources development, *Tidal waters, *Canada, *Hydroelectric power, Projections, Water yield, Tidal effects, Tidal powerplants, Planning, Tidal energy, Electric power production.
Identifiers: *Ungava Bay (Canada).

The principles underlying the exploitation of tidal energy and estimated power potential of the bays and estuaries on the periphery of Ungava Bay, Canada, as well as the hydro potential of the rivers of the Ungava hinterland are reviewed. The Payne, the Leaf, the Koksoak-Larch-Kaniapiskau system, the Whale and the George Rivers all have their sources in the interior highlands and drop from heights ranging from 220 to 740 m above sea level. The Koksoak has a mean discharge of 2,420 cubic meters/sec. Together, they have a power potential of 12,000 MW. The tidal range (water level change) at the entrance of the Koksoak River in Ungava Bay may reach 12.6 m, while inside Leaf Basin a little further to the northwest, it may get as high as 13.4 m. The range at Saint John, N.B., half-way up the Bay of Fundy is about 10 m. Considering that the volume of water contained in Ungava Bay is five times as large as in the Bay of Fundy, much more tidal energy is present in Ungava Bay. (Woodard-USGS)

Descriptors: *Rainfall-runoff relationships, *Annual, *Variability, *Statistical methods, Runoff coefficient, Probability, Curves, Equations.
Identifiers: *Kazakhstan (USSR), Skewness.

Investigation of variability of annual runoff and annual precipitation was based on extensive field observation data. The coefficient of variation of precipitation is very stable and generally varies between 0.2 and 0.3; the coefficient of skewness is assumed to equal 1.5. Variability of annual runoff is higher than variability of precipitation; the ratio of these values increases with the increase in the index of dryness. The coefficient of skewness ranges from 1.5 to low runoff variability to 2 at high runoff variability. Proposals to normalize the coefficient of skewness of annual river runoff in Kazakhstan at 2.5 lack sufficient validity. (Josefson-USGS)

PRICKETT CREEK WATERSHED, WEST VIRGINIA (FINAL ENVIRONMENTAL STATEMENT).
Soil Conservation Service, Washington, D.C.

Available from the National Technical Information Service as EIS-WV-73-0298-F, $4.25 in paper copy, $1.45 in microfiche. February 1973. 37 p, 1 map, 1 append.

Descriptors: *West Virginia, *Environmental effects, *Flood control, Watershed development, Comprehensive planning, Land use, Channel improvements, Flood prevention, Erosion, Recreation, Flood plain management, Water quantity control, Levees, Sediment control, Floodproofing.
Identifiers: *National Environmental Policy Act, *Environmental Impact Statements.

The Prickett Creek Watershed Project in West Virginia is to be carried out by sponsoring local organizations with federal assistance under the provisions of Public Law 566. The project will consist of conservation land treatment measures, one single-purpose floodwater retarding structure, and 7,030 feet of channel work to include levees, floodwalls and stream channel work. Planned measures will provide flood and sediment protection primarily to residences and industrial properties and transportation facilities in the Prickett Creek Watershed. Probable favorable effects of the project will be flood and sediment protection for improvements in the watershed and downstrem areas of the Monongahela and Ohio Rivers, stabilization of critically eroding areas, provision for a year-round fishery for public use, and the creation of job opportunities. Adverse effects expected include temporary increase of turbidity and sedimentation of stream water and decreased protective vegetation. Alternatives considered were flood proofing, flood plain management, flood insurance, land treatment measures only, and simply leaving the creek as it is. (Mockler-Florida)

LEVEE UNIT NO. L-246, MISSOURI RIVER LEVEE SYSTEM (FINAL ENVIRONMENTAL STATEMENT).
Army Engineer District, Kansas City, Mo.

Available from the National Technical Information Service as EIS-MO-73-0099-F $4.50 in paper copy, $1.45 in microfiche. January 18, 1973. 40 p, 2 map.

Descriptors: *Missouri, *Levees, *Environmental effects, *Missouri River, Dams, Flood control, Flood prevention, Drainage, Water quality control, Agriculture, Rivers, Habitats, Channel improvement, Sediment load.
Identifiers: *National Environmental Policy Act, *Environmental Impact Statements, *Chariton County, Mo.

The proposed project would consist of the construction of a flood control project composed of a system of levees, interior drainage structures, and channel relocations and modifications. It would provide flood protection, modify and relocate a creek, increase sediment load into a lake, and preserve the recreational potential of a lake. The modification of five miles of the creek would change the natural character of the channel, associated stream biota, and the adjacent wildlife habitat; the recreation potential of this natural creek would be reduced. Moreover, the levee construction would destroy grass, forbs, timber, and other wildlife habitat. Alternatives to the proposed project include no action at all, diversion of the creeks involved, additional channel and levee construction, and a lower height of main stem levees. The total area to be protected by the proposed levee system amounts to 19,000 acres of which 14,700 are agricultural. The major crops raised are corn, wheat, and soybeans. The conclusion reached is that the adverse effects are ameliorated or outweighed by the potential favorable effects so that the project should be implemented. (Mockler-Florida)
W74-00879

GILLHAM LAKE, COSSATOT RIVER ARKANSAS (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Tulsa, Okla.

Available from National Technical Information Service, U.S. Dep't. of Commerce as PB-202 134-F-2, $3.00 paper copy; $1.45 microfiche. August 31, 1971. 285 p.

Descriptors: *Arkansas, *Environmental effects, *Reservoirs, *River basin development, Dams, Water quality standards, Aesthetics, Planning, Water supply, Water pollution control, Aquatic environment, Recreation facilities, Flood protection, Watershed management.
Identifiers: *Environmental Impact Statements, *National Environmental Policy Act, *Gillham Lake, Ark.

The Gillham Dam and Reservoir was authorized for construction in 1959 for purposes of flood control, water supply, water quality control, and fish and wildlife preservation. At full pool, 13.5 miles of the Coassatot River would be inundated, forming a 4,680-acre lake. Normal lake levels or conservation pool levels will create a 1,370-acre lake, inundating 7.5 miles of the Cossatot River. Since recreational development along the Cossatot River is nonexistent, this project would serve as the site of extensive recreational projects. Environmental degradation would be minor with recreation developments occupying minimal space and constructed in a manner compatible with the environment. On the other hand, preserving the Cossatot River as a scenic and recreation river would result in few, if any, benefits, although there will be a loss in that the project will irretrievably and irrevocably commit the area to use as a reservoir. (See also W73-15137 and W74-00882) (Mockler-Florida)
W74-00881

GILLHAM LAKE, COSSATOT RIVER, ARKANSAS, APPENDIX II (PHOTOGRAPHS), APPENDIX III (ENVIRONMENTAL ELEMENTS), (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, Tulsa, Okla.

Available from National Technical Information Service, U.S. Department of Commerce as PB-202 134 F-3, $3.00 paper copy, $1.45 microfiche. January 10, 1972. 138 p, 9 map, 58 photo, 38 tab.

Descriptors: *Arkansas, *Environmental effects, *Reservoirs, Dams, Planning, Water quality standards, Wildlife habitat, Aquatic environment, River basin development, Flood control, Water pollution control, Recreation facilities.
Identifiers: *Environmental impact statement; *National Environmental Policy Act; *Gillham Lake area, Howard and Polk Counties, Ark.

The environmental impact of the Gillham Dam is discussed with reference to the geologic factors. There are no known mineral resources in the Gillham project area. The most important adverse effect of the Gillham project on the mineral resources is the reduced natural replenishment of commercial sand and gravel deposits on the lower Cossatot River. In addition, the building of Gillham Dam will cause a loss of the river bottom site hardwoods, but not a complete loss of those on the bottomland. To a certain extent many of the bottomland hardwoods will return to the lake shore after an interim period. Fish currently occupying the headwaters of the Cossatot are expected to continue to maintain healthy populations upstream from the lake. The impoundment of Gillham Lake is not expected to create a serious mosquito breeding problem because of the steep, mountainous topography and the absence after impoundment of large, flat shallow water areas which would be conducive to establishment of aquatic vegetation. The ultimate project operation will also provide 28 c.f.s. average annual releases for downstream water quality requirements through a 50-year drought. (See also W74-00881) (Mockler-Florida)

MOISTURE BALANCE IN THE OAK FORESTS ON THE NORTHERN DONETS RIGHT BANK, (IN RUSSIAN),
A. I. Mikhovich.
Lesovod Agrolesomelior Resp Mezhved Temat Nauchn Sb. 20. p 103-112. 1970.
Identifiers: Forests, Interception, *Moisture balance, *Oak forests, Precipitation, Runoff, Transpiration, *USSR (Donets River), River banks.

The results are given of 10-yr stationary hydrological investigations in various types of oak stands of the Mayaki Forest of the Slavyansk Forest Lumbering Farm in the Donetsk region, as well as brief characterization of weather conditions during each year. The interception of precipitation by tree crowns in dry (D1) and mesic (D2) oak stands, as well as soil freezing, snow accumulation and the duration of snow melt, surface runoff, total evaporation under the forest canopy, accumulation and expeniture of moisture in 3 m thick soil-ground layers, moisture balance during the growing season according to years dynamics of soil humidity, depth of wetting, the drying of the ground soils and water expenditure for plant transpiration were all studied. The immense water-regulating and soil protective role of the oak forests on the slopes is indicated. The almost complete absence of the summer storm runoff in oak forests and the reduction to a minimum of the annual surface runoff (the coefficient of the annual surface runoff varies in dry oak forests according to years from 0.000-0.033, and from 0.000-0.072 in fresh oak forests) prevent the washing out of soil from the bank slopes, and the silting of the bed of the Northern Donets River.--Copyright 1973, Biological Abstracts, Inc.
W74-00983

COURSE OF PHYTOCENOSIS FORMATION IN CLOSED SHALLOWS OF FLOOD BAND OF THE KIEV HYDROELECTRIC STATION RESERVOIR, (IN UKRAINIAN),
L. S. Balashov.
UKR Bot Zh. Vol 29, No 2, p: 191-195. 1972. (English summary).
Identifiers: Bogs, Flood bands, Fodder, Forests, Hydro electric plants, *Phytocenosis formation, Reservoirs, *USSR (Kiev reservoir), Waterfowl nesting.

The character of developing basin overgrowth is considered in the flood band of the Kiev (USSR) reservoir forests and bogs as well as in the temporal basins. The rather slow process of growing is observed: for 5 yr, only duckweed is distributed everywhere in the closed basins and other higher aquatic plants are met rarely. Some basins are typically oligotrophic. Their total area in the forests region is 1500 ha. It would be expedient to make the most efficient use of these basins for nesting of waterfowl which necessitates enriching the flora with valuable food plants.--Copyright 1973, Biological Abstracts, Inc.

W74-01011

EFFECT ON FLOOD INTRODUCED PLANTS IN THE DESNA RIVER FLOOD PLAIN NEAR OSTRA, (IN UKRAINIAN),
A. I. Barbarych.
Ukr Bot Zh. Vol 29, No 4, p: 517-520. 1972, (English summary).
Identifiers: *Floods, Floodplain, Rivers, Temperature, *USSR (Desna River), Plant communities.

A list of plant species which died as a result of long flooding during the severe flood in 1970 in flood plain of the Desna river (USSR) (from 3 till 4 wk under a water layer to 2 m) as well as a list of species which endured it are presented. The negative effect of flood on the introduced plants intensifies if, besides the long period of flood, there is influence of water high temperature, as was observed during the flood in 1931.--Copyright 1973, Biological Abstracts, Inc.

IN SEARCH OF NEW METHODS FOR RIVER SYSTEM PLANNING,
Harvard Univ., Cambridge, Mass. Graduate School of Public Administration.
A. Maass, and M. M. Hufschmidt.
Journal of the Boston Society of Civil Engineers, Vol 46, No 2, p. 99-117, April, 1959. 1 fig.

Descriptors: *Water resources development, Planning, *Methodology, *Mathematical studies, *Idaho, Simulation analysis, Mathematical models, Cost-benefit ratio, *River basin development.
Identifiers: *Maximizing-net benefits, *Planning techniques, *Clearwater River Basin (Idaho).

The research goal of the Harvard water resource planning and development program was to improve methodology for the planning and design of multi-unit, multi-purpose water resource systems. The objective of improved planning techniques was to approximate that unique combination of system units and purposes which will maximize net benefits. This is a point where (1) the marginal benefits are equal for the last dollar spent in producing each output and (2) marginal costs equal marginal benefits for each output and for the system as a whole, if there are no monetary or budgetary constraints--or if such constraints are effective, marginal costs for an increment of output are equal for all system units. The production function, the physical relation between inputs and outputs, is important. Based on data for Clearwater River Basin, Idaho, a prototype riber basin system, with 4 storage dams, 1 diversion dam, 2 power plants, and 1 system of irrigation distribution works, was developed representing three purposes--irrigation, power, and flood control. Techniques for determining the production function were: (1) 'working around the edges,' essentially the method than used for selecting, by engineering judgement and experience, a limited number of combinations for detailed investigation and analyzing these; (2) simple mathematical models, abstracting the problem so that most of the analysis could be handled by standard mathematical methods; and (3) simulation of the system on high-speed electronic digital computers under given assumptions regarding natural flow hydrology; levels of time patterns of outputs; sizes of reservoirs, power plants, canals and other system units; operating policy; and costs and benefit functions. (Edwards-North Carolina)
W74-01029

STORM DRAINAGE STUDY, (CHATHAM COUNTY-SAVANNAH, GEORGIA).
Chatham County-Savannah Metropolitan Planning Commission, Savannah, Ga.

July, 1972. 26 p, 4 maps. HUD-GA-04-00-0166.

Descriptors: *Flooding, *Drainage, *Drainage systems, *Storm runoff, Flood damage, Drainage programs, Canals, Culverts, Water quality, Tidal effects priorities, Costs, Land use, *Georgia.
Identifiers: *Savannah (Geo).

Storm water drainage is a significant problem in the Savannah metropolitan area as the topography is quite flat, tidal action often reduces the hydraulic gradient of the drainage canals, and vegetation and debris in the canals retard water flows. Numerous projects to improve storm water drainage, some policies with regard to the provision of drainage by subdivision developers, possible assistance programs through the U.S. Army Corps of Engineers, and the water quality aspect of storm runoff are discussed. The proposed projects, consisting mostly of new channels, tidal gates, pumping stations, and enlarged culverts, are presented of a drainage basin basis and then ranked in terms of importance. Cost estimates for the 2B ranked projects are also included. Much of the improvement program consists of enlarging and maintaining existing canals and culverts to relieve flooding conditions in existing urban areas rather than extending drainage facilities to newly urbanizing areas. STUDY OF THE CONDITION AND GROWTH OF FOREST PLANTATIONS, (IN RUSSIAN),
G. S. Ivanov.
Sb Rab Po Lesn Khoz Mold Lesn Opytn Stn. 4, p 85-128, 1970.
Identifiers: *Black locust, Cutting, Forest plantations, Growth, *Oak, Plantations, *USSR (Gerbovetskii Forest).

Investigations conducted in the Gerbovetskii Forest (Moldavia) established that the main cause of the problems of oak and black locust plantations under dry conditions is the excessive density of the stands. The use of moisture-loving oak forms (from the floodplain, the lower parts of ravines) in dry habitats is an additional factor determining the problem of oak plantations. Crises occur when the oak is 15-20 yr old and the black locust-8-10 yr old. Well developed trees should be formed by improvement cuttings from an early age, establishing oak plantations in accordance with 2-story variants of the woody-shady type. A list is presented of 82 factors of scientific significance in the Gerbovetskii Forest for the purpose of studying the growth of stands with the participation of various tree species. The necessity of establishing plantations which are of optimum composition is based on the principles of the age-class theory as indicators of the degree of resistance. The principle of optimum improvement cuttings is discussed.--Copyright 1973, Biological Abstracts, Inc.

AQUATIC VEGETATION OF FISHPONDS OF THE WESTERN REGIONS OF THE UKRAINE, (IN RUSSIAN),
Ukrainian Research Inst. of the Fish Industry, Kherson (USSR).
R. L. Arenkova.
Rastit Resur. Vol 8, No 2, p 229-236, 1972. Illus.
Identifiers: *Aquatic vegetation, *Macrophytes, Ponds, *USSR (Ukraine), Fishponds, Water chemistry.

The fishponds of the western regions of the Ukraine are severely overgrown with macrophytic plants. Overgrowths occupied from 10-95% of the area in 141 of the 177 ponds investigated. The maximum density of overgrowth and the biomass of the macrophytic plants was noted between the end of June and the middle of July, and then decreased toward fall. The distribution of macrophytic plants was closely related with water chemistry and bottom deposits.--Copyright 1973, Biological Abstracts, Inc.

VEGETATION AND STRATIGRAPHY OF BOGS OF THE EASTERN FOREST-STEPPE, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Instytut Botaniki.
A. I. Kuz'mychov.
Ukr Bot Zh. Vol 29, No 1, p 42-48, 1972, Illus, (English summary).
Identifiers: Alder, *Bogs, Economics, Equisetum, Forest steppe, Reed, Rush, Sedge, Sphagnum, Steppe, *Stratigraphy, *USSR (Upland), *Vegetation, Willow.

Peat-bog region of the Eastern Forest-Steppe is located on the southwestern spurs of the Central USSR Upland. Boginess of this region is the least of all the forest-steppe regions in the Ukraine and accounts for about 0.5% of the territory. The bogs are backwater, confined to the flood plains of numerous small rivers. There are also ravine and sometimes Sphagnum eutrophic bogs in depressions on pine-forest terraces. Natural plant cover of bogs is presented by eutrophic groupings where the formations of European alder and grey willow predominate. The formations of herbaceous groupings, reed, Equisetum, rushy and some sedge species, are less distributed. Bog vegetation is strongly distrubed as a result of economic activity. The greatest part in peat structure is taken by alder-reed, swamp-forest, and multilayer-swamp types of peat deposits. Reed-alder/alder type of deposits is rate. In the peat deposits, the alder-reed and reed types of peat predominate which are distinguishable for their high ash content. In more than half the samples analyzed, ash control is above 40%. By the decomposition degree, the peats are average-to well-decomposed. The bogs of the eastern forest-steppe appeared as a result of bogging of flood plain alder forests and basins. The bogs of this region with respect to genesis, plant, cover, peat deposits properties and geomorphological types are close to those in the neighboring regions of the Central USSR Upland.--Copyright 1973, Biological Abstracts, Inc.
W74-01096

EFFECT OF DEPTH OF SOIL CULTIVATION AND OF FERTILIZERS ON THE SURVIVAL AND GROWTH OF PINE ON THE LOWER DNIEPER SANDS, (IN RUSSIAN),
T. T. Govorova.
Lesovod Agrolesomelior Resp Mezhved Temat Nauchn Sb. 20. p 96-102. 1970.
Identifiers: Fertilizers, Growth, Moisture, Peat, *Pine, Pinus-Nigra-Caramanica, Sands, *Soil cultivation, *USSR (Dnieper RIVER).

The effect of depth of soil cultivation and peat application as fertilizer on the survival and growth of Pinus nigra caramanica plantations on hillocky Lower Dnieper sands was studied over an 11-yr period. The plantations were established with holes of 50 x 50 cm, with 5 variants as regards depth of soil cultivation: 150, 100, 70, 50 and 30 cm, and with the application of peat and without it. Eight to 10 kg of peat per plot was put at the bottom of the holes in a 10-cm layer. Survival rate of pine in the year of planting (by May 15) in all the variants of the trial was quite high (93-100%); 74-88% in Oct. With the increase of the depth of loosening the rate of pine survival increased. Data are presented on the development of root systems and soil moisture in relation to the depth of soil cultivation. With equal soil cultivation, peat improves the growth and the general condition of plantings during the first 2-3 yr, later the differences in growth level out. The use of peat is a shortterm measure; it is dried out as early as within one growing season during the year of planting. The positive effect of the depth of soil preparation on pine growth is traced in the plantations up to the age of 11 yr.--Copyright 1973, Biological Abstracts, Inc.

THE USE OF GROUNDWATER IN MINNESOTA,
Minnesota Dept. of Natural Resources, St. Paul. Div. of Waters, Soils and Minerals.
R. D. Harnack.
In: Proceedingsof Conference on Toward A Statewide Ground Water Quality Information System and Report of Ground Water Quality Subcommittee, Citizens Advisory Committee, Governors Environmental Quality Council: University of Minnesota Water Resources Research Center Mimeographed Report, p 30-34, February 1973. 3 tab. 14-31-0001-3823.

Descriptors: *Water resources development, *Groundwater, *Minnesota, Water utilization, Irrigation water, Domestic water, Water supply, Water quality, Hydrologic data, Data collections.

The use of groundwater in Minnesota has increased during the past 5 years, especially in the areas of rural domestic use and irrigation. At present there is very little regulation as to the use of groundwater in Minnesota. In many parts of the State groundwater shortages are due to the lake of information on, rather than the actual paucity of the resource. Where information is available, there is indication that the groundwater resource is relatively undeveloped. This can be illustrated by the example of the Twin Cities artesian basin. It is estimated that this basin could safely yield about 600-700 mgpd. Present withdrawal is about 136 mgpd. Reluctance to develop this groundwater source has been due to improper analysis of data available. With the increased use of groundwater in rural areas more information and data must be obtained to provide for proper analysis of the resource. (See also W73-09113) (Knapp-USGS)

GROUNDWATER SURVEY OF THE ERBIL PROJECT AREA,
Institute for Applied Research on Natural Resources, Baghdad (Iraq).
R. H. Haddad.
Technical Bulletin 50. May 1973. 28 p, 13 fig, 2 tab, 5 ref.

Descriptors: *Groundwater resources, *Hydrologic data, *Surveys, *Water chemistry, Aquifers, Exploration, Hydrogeology, Testing, Water levels, Geophysics.
Identifiers: *Iraq.

Carried out under a UNDP-UNESCO project, a groundwater survey of the Erbil Project area is part of the pre-project activity of a UNDP-FAO investigation. This reconnaissance stage is restricted to an inventory of information, and the collection, chemical analysis, and interpretation of groundwater samples of the area. The area is well endowed with good aquifers containing water of a quality generally suitable for irrigation and drinking. Recommendations include aquifer testing of existing pumped wells, water level observations (to be increased to weekly tests for a period of at least 6 months-year), estimates of present rates of withdrawal, discharge, and recharge, and finally, geo-electric prospecting. Information is given on the environment generally, including geology, climate, geomorphology, hydrogeology, and hydrochemistry of the area, with tables displaying the chemical analyses and classification of existing groundwater. Descriptors: Water sources, Water resources, Water supply, *Water law, *Water conservation, Hydrology, *Aquifer characteristics, *Groundwater pollution, *Groundwater management.
Identifiers: Zone of saturation, Zone of aeration.

A brief review of ground water, its occurrence, properties, advantages and problems is presented. The nature of ground water occurrence, movement and recharge is discussed. The importance of groundwater as a contributor to surface sources; as municipal and individual water sources; and the results of improper use of these ground water sources is discussed. The factors leading to ground water pollution and their short and long-term effects are discussed. The current efforts in ground water regulation in the areas of withdrawal and protection from contamination are described. (Campbell-NWWA)

SIMULATING EFFECTS OF HARVEST CUTTING ON SNOWMELT IN COLORADO SUBALPINE FOREST,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
C. F. Leaf, and G. E. Brink.
National Symposium on Watersheds in Transition, June 19-22, 1972, Fort Collins, Colo, p 191-196. 7 fig, 2 tab, 33 ref.

Descriptors: Computers, Computer models, Coniferous forests, *Forest management, Model studies, Mountain forests, Simulation analysis, *Snowmelt, Vegetation effects, Watershed management, *Colorado, *Cutting management.

A recently developed dynamic model has produced tentative results regarding the probable effects of timber harvesting on snowmelt in a central Colorado subalpine watershed. Snowmelt rates in mature lodgepole pine and Engelmann spruce forest were compared against a hypothetical pattern of 5 tree-height diameter openings, cut into the watershed so that trees on 40 percent of the area were removed. The average effect for the 8 years simulated was to increase melt rates early in the melt season and diminish snowmelt later. Although harvest cutting affected timing by causing the bulk of the snowmelt to occur earlier, the duration of the snowmelt season was apparently not significantly changed. Early-season snowmelt was accelerated in the small openings, but in both natural forest and cut-over areas, the last snow melted at about the same time. (Forest Service)

LONE PEAK WILDERNESS AREA, UTAH, AND DESIGNATING A SEGMENT OF THE COLORADO RIVER IN UTAH AS PART OF THE WILD AND SCENIC RIVERS SYSTEM.

Hearing--Subcomm. on Public Lands--Comm. on Interior and Insular Affairs, U.S. Senate, 92d Cong, 2d Sess, July 7, 1972. 134 p, 2 fig, 2 map, 4 photo, 4 tab.

Descriptors: United States, *Colorado River, *Utah, *Legislation, *National forests, *Administration, Regulation, Wild River Act, Recreation, Scenery, Water policy.
Identifiers: *Lone Peak Wilderness Area (Utah).

The first bill discussed, S.2901, would amend the Wild and Scenic Rivers Act by designating a segment of the Colorado River in the State of Utah as a component of the National Wild and Scenic Rivers System. The second bill, S.3466, would authorize the Secretary of Agriculture to review as to its suitability for preservation as wilderness the area commonly known as the Lone Peak Area in Utah. The area involved is approximately 13,000 acres within the Wasatch and Uinta National Forests. The Lone Peak Area is not classified as a national forest primitive area but is included among the areas the Forest Service is now considering for inclusion in the national wilderness preservation system. S.3466 would designate the Lone Peak a wilderness before completion of an intensive study and review process similar to that applicable to national forest primitive areas. For this and other resons many of the witnesses appearing before the subcommittee indicated that such a review should be accomplished before the Lone Peak area be designated as wilderness. Soil Conservation Service, Washington, D.C.

Available from the National Technical Information Service as EIS-MO-73-0098-F $4.25 in paper copy, $1.45 in microfiche. January 1973. 40 p, 1 map, 1 tab.

Descriptors: *Missouri, *Environmental effects, *Watershed development, Flood control, Recreation, Land use, Dams, Flood prevention, Flood plain development, Agriculture, Wildlife habitat, Parks, Ecology.
Identifiers: *Environmental Impact Statements, *National Environmental Policy Act, *Newton Co., Mo.

The project consists of land treatment measures, seven floodwater retarding dams, and three debris basins. Flood damage to 1,877 acres of agricultural lands will be reduced and peak flows from the 100-year storm will be reduced 37 percent in Seneca. Sediment yield will be reduced 25 percent. The installation of the project will change the land use of areas needed for dams, spillways, and to store sediment, and, as a result, the intensification of agriculture in the flood plain is expected to reduce wildlife cover. Alternatives to the proposed project include land treatment only; increasing the capacity and efficiency of the channel; relocating damageable values and providing zoning; construction of levees; and developing flood-prone lands for purposes little affected by flooding such as parks, tree farms, or wildlife areas. The Lost Creek Watershed project is located in Newton County, Southwest Missouri, and contains 39,100 acres or approximately 61 square miles within the Arkansas River Basin, and flows into the Grand Lake of the Cherokees. Identifiers: *Erosion control, *Polymer K-4, Resistance, *Soil cover, Soil treatment.

The optimum concentration of polymer K-4 for the soils is 0.025-0.1%. Such doses prevent erosion of clay and loam soils by the bottom speed of the stream (V delta) 30-40 cm/sec and of sandy-loam soils by the bottom speed of the stream (V delta) 19-25 cm/sec.--Copyright 1973, Biological Abstracts, Inc.

05. WATER QUALITY MANAGEMENT AND PROTECTION

HYDROCARBON INCORPORATION INTO THE SALT MARSH ECOSYSTEM FROM THE WEST FALMOUTH OIL SPILL,
Woods Hole Oceanographic Institution, Mass.
K. A. Burns, and J. M. Teal.
Available from NTIS, Springfield, Va., 22151 as COM-73-10419 Price $3.00 printed copy; $1.45 microfiche. Report, Reference No. 71-69, November 1971. 24 p, 31 fig, 1 tab, 5 ref. Grant 14-17-0007-1128 (BCF). Grant GA-28365 (NSF).

Descriptors: *Water pollution sources, *Oil spills, *Bays, *Massachusetts, Environmental effects, Ecosystems, Path of pollutants, Marshes, Sampling, Chemical analysis, Organic compounds, Cores, Mud, Marsh plants, Bottom fish, Data collections, Evaluation, Ecology.
Identifiers: *Buzzards Bay (Mass), *Wild Harbor Marsh (Mass), Hydrocarbons.

The oil barge 'Florida' ran aground just off Little Island, West Falmouth, Massachusetts on September 16, 1969. About 175,000 gallons of Number Two fuel oil leaked into Buzzards Bay and the adjacent Wild Harbor Marsh. Samples of marsh muds and organisms collected nearly a year after the spill were analyzed for movement of polluting hydrocarbons through the marsh ecosystem. The dead areas were the most heavily polluted. A deep mud core in the dead area showed oil has penetrated to at least 70 cm. Virtuallly all the marsh organisms living in the contaminated area were affected by the oil at least to the extent that they accumulated oil hydrocarbons in their tissues. Two processes may occur as the oil passes through the marsh ecosystem. There may be a progressive loss in the straight chain hydrocarbons in relation to branched chain, cyclic and aromatic hydrocarbons. There also appears to be a selection for the higher boiling fractions of the contaminants higher up in the food chain. (Woodard-USGS)

RECOVERY OF BACTERIOPHAGE FROM CONTAMINATED CHILLED AND FROZEN SAMPLES OF EDIBLE WEST COAST CRABS,
Notre Dame Coll., Belmont, Calif. Dept. of Biology.
R. DiGirolamo, and M. Daley.
Applied Microbiology, Vol 25, No 6, p 1020-1022, June 1973. 1 fig, 1 tab, 13 ref.

Descriptors: *Bacteriophage, *Crabs, *Storage, *Temperature, Viruses, Crustaceans, Shellfish, E. coli, Freezing, Assay, Pollutant identification, Pollutants.
Identifiers: *Cancer magister, *Cancer antennarius, Recovery, Survival, Coliphage T4, Escherichia coli B, Enteroviruses.

Edible West Coast crabs (Cancer magister and C. antennarius) were contaminated with bacteriophage and then held in a chilled or frozen state. Two separate series of experiments were carried out whereby the crabs were, respectively, exposed to 50,000 and 46,000 phage plaque-forming units (PFU) per ml of seawater for 24 h. The results of the chilling experiments which used contaminated unprocessed and processed boiled crabs exhibited a gradual decrease in virus titer in all samples during the entire test period. After 120 h, however, 7000 virus PFU/g were still recovered from the unprocessed crabs and 45 virus PFU/g from processed samples. The freezing studies also showed a gradual decrease in virus titer during the entire experimental period. After 20 days of storage 15,000 virus PFU/g from the frozen unprocessed crabs and 140 virus PFU/g from the processed samples were recovered. This represents survival or recovery rates of approximately 42 and 55 percent, respectively. At the end of the study (30 days), 12,000 virus PFU per g were still found to be present in the unprocessed samples, and 45 PFU per g were recovered from the processed samples. (Holoman-Battelle)

SOME OBSERVATIONS ON THE INCORPORATION OF NOVOBIOCIN INTO HEKTOEN EN-

TERIC AGAR FOR IMPROVED SALMONELLA ISOLATION,
Campbell Inst. for Food Research, Camden, N.J.
D. A. Hoben, D. H. Ashton, and A. C. Peterson.
Applied Microbiology, Vol 26, No 1, p 126-127, July 1973. 1 tab, 3 ref.

Descriptors: *Isolation, *Salmonella, *Antibiotics (Pesticides), *Pollutant identification, Inhibition, Bactericides, Slectivity, Enteric bacteria, E. coli.
Identifiers: *Novobiocin, *Hektone enteric agar, Culture media, Selective media, Salmonella cubana, Serotypes, Salmonella seftenberg, Salmonella typhimurium, Salmonella urbana, Salmonella montevideo, Salmonella wothington, Citrobacter fruendii, Proteus mirabilis, Proteus morganii, Citrobacter diversus.

A preliminary study was conducted to determine whether the selectivity of Hektoen enteric agar (HEA) for Salmonella isolation could be improved by the incorporation of an appropriate concentration of novobiocin. Pure cultures of salmonellae and related organisms were used. Broth cultures were surface plated in quadruplet at 2 different concentrations. HEA plates were incubated at 37C for 18-20 h prior to counting. When novobiocin at 5 or 10 micrograms/ml was incorporated into HEA, the Proteus and Citrobacter varieties employed in this study were inhibited. The E. coli varieties used presented no problems, because they produced salmon-colored colonies; however, the growth of most strains tested appeared reduced at these concentrations of antibiotic. Ten serotypes of Salmonella grew without any apparent inhibitory effects when novobiocin was used at 2, 5, 10, and 15 micrograms/ml in the HEA. At 20 micrograms of antibiotic per ml of agar, Salmonella grew, but at a much slower rate and without the production of the typical black-centered colonies. Novobiocin was stable at concentrations up to 20 micrograms/ml in HEA. Agar plates containing novobiocin stored for several weeks at 22C gave similar inhibitory results to freshly prepared plates with the nonsalmonellae. (Holoman-Battelle)

IDENTIFICATION AND CHARACTERIZATION OF THE MICROFLORA AND SPOILAGE BACTERIA IN FRESHWATER CRAYFISH PROCAMBARUS CLARKII (GIRAD),
Louisiana State Univ., Baton Rouge. Dept. of Food Science.
N. A. Cox, and R. T. Lovell.
Journal of Food Science, Vol 38, No 4, p 679-681, May/June 1973. 5 tab, 12 ref.

Descriptors: *Cultures, *Crayfish, *Food processing industry, *Separation techniques, *Pseudomonas, Pollutant identification.
Identifiers: Spoilage, *Achromobacter, Culture media, Sample preparation, Alcaligenes, Micrococcus, Flavobacterium, Aerobacter, Bacillus, Lactobacillus, Sarcina, Proteus, Procambarus clarkii, Staphylococcus.

Unwashed peeled tail meat of freshwater crayfish (Procambarus clarkii) was collected from processing lines, stored up to 24 days at OC and 5C, and analyzed for spoilage bacteria. Samples were homogenized in a blender, diluted with a phosphate buffer, and cultured with Milk-Protein Hydrolysate. A total of 280 isolated colonieswere randomly picked and generically identified. These cultures were inoculated into sterile crayfish substrate for evaluation of their ability to produce spoilage. Spoilage occurred when counts reached 1 billion per gram. Eleven different genera were found in the 280 isolates; three genera, Achromobacter, Alcaligenes, and Psudomonas comprised approximately 82 percent of the isolates. Micrococcus, Staphylococcus, and Alcaligenes made up the major portion of the bacterial flora in fresh tail meat whereas Pseudomonas and Achromobacter predominated in the spoiled product. Classification of the bacteria according to spoilage rate showed Pseudomonas to predominate with Achromobacter a distant second. These two bacteria are concluded to be the predominant psychrophilic spoilage organisms in commercial crayfish tail meat. (Little-Battelle)
W74-00620

FATTY ACID COMPOSITION OF L-FORMS OF STREPTOCOCCUS FAECALIS CULTURED AT DIFFERENT OSMOLALITIES,
Veterans Administration Hospital-Wadsworth, Los Angeles, Calif. Research and Medical Service.
J. Z. Montgomerie, G. M. Kalmanson, and L. B. Guze.
Journal of Bacteriology, Vol 115, No 1, p 73-75, July 1973. 1 tab, 10 ref.

Descriptors: *Cultures, *Pollutant identification, Cytological studies, Organic acids, Chemical analysis, Aerobic bacteria, Lipids.
Identifiers: *Streptococcus faecalis, *Fatty acids, *Chemical composition, *Osmotic pressure, Chemotaxonomy, Flame ionization gas chromatography, Culture media.

The fatty acid composition of the membranes of three different penicillin-produced L-forms of Streptococcus faecalis was determined: (1) a stable (nonreverting) L-form (T53) cultured in brain heart infusion (BHI) with 0.5 M sucrose; (2) a stable L-form (T531) cultured in BHI without sucrose; and (3) an unstable L-form (T9) cultured in BHI with 0.5 M sucrose and 1,000 U of penicillin per ml. L-forms were obtained by centrifugation and lysed by washing in 1 mM tris (hydroxymethyl) aminomethane-hydrochloride buffer. The parent S. faecalis was also cultured in BHI and BHI containing 0.5 M sucrose, and washed with buffer. The fatty acid composition of L-forms of S. faecalis cultured in BHI without sucrose (370 mosmol) had higher C18:1 and lower C18 than L-forms cultured in the same media with added 0.5 M sucrose (950 mosmol) in both exponential and stationary cultures. In the stationary phase of growth, C19 was reduced in the L-forms cultured without sucrose. Similar changes were seen in the parent S. faecalis cultured in the two types of media. These changes in membrane fatty acids may relate to osmo-regulation of the L-forms. (Holoman-Battelle)

FACTORS WHICH INFLUENCE THE ENUMERATION OF BDELLOVIBRIO BACTERIOVORUS IN SEWAGE AND RIVER WATER,
University of Wales Inst. of Science and Tech., Cardiff.
D. G. Staples, and J. C. Fry.
Journal of Applied Bacteriology, Vol 36, No 1, p 1-11, March 1973. 5 fig, 5 tab, 19 ref.

Descriptors: *Sewage, Rivers, Methodology, *Pollutant identification, Hosts, Pollutants, Natural streams, Protoza, Bacteria, Parasitism, Centrifugation, Isolation, E. coli, Water sampling.
Identifiers: *Enumeration, *Pretreatment, Sample preparation, *Bdellovibrio bacteriovorus, Double layer plating technique, Culture media, Escherichia coli B, Pseudomonas aeruginosa, Proteus vulgaris, Escherichia coli K12, Aerobacter aerogenes, Serratia marcescens, Pseudomonas fluorescens, Arthrobacter ureofasciens, Achromobacter, Membrane filters, Homogenization, Lactobacillus plantarum, Culturing techniques.

A double layer plating technique was used for counting Bdellovibrio bacteriovorus in river water and sewage samples. The optimum conditions for enumeration were provided by dilute media with 0.6 percent of agar as the top layer, incubated for 6 days at 30 degrees with Achromobacter sp. as the host. Pretreatment of samples affected counts: centrifugation and membrane filtration reduced the bdellovibrio count, homogenization increased it. Protozoa in sewage samples caused large plaques that greatly hindered counting and attempts to eliminate these plaques were unsuccessful. The highest counts in sewage samples averaged 900 cells/ml. (Holoman-Battelle)
W74-00624

ON THE ISOLATION OF VIRUS FROM SEWAGE TREATMENT PLANT SLUDGES,
Royal Veterinary and Agriculture Coll., Copenhagen (Denmark).
E. Lund, and V. Ronne.
Water Research, Vol 7, No 6, p 863-871, June 1973. 9 tab, 6 ref.

Descriptors: *Viruses, *Isolation, *Sewage sludge, *Sewage treatment, *Pollutant identification, Methodology, Municipal wastes, Biological treatment, Chemical degradation, Activated sludge, Sewage effluents, Chemical precipitation, Pollutants, Centrifugation, Lime, Cultures, Ethers.
Identifiers: Pollutant removal, Coxsackie virus B3, Adenovirus 3, Coxsackie virus B1, Coxsackie virus B5, Ferric chloride, Aluminum sulfate, Echovirus 19, Decontamination, Concentration.

Sludges from biological and chemical treatments of urban sewage were examined for virus. The virus isolations were made in tube cultures of HeLa cells. The cells were grown in a medium consisting of 7 percent calf serum in Hanks' solution to which 0.5 percent lactalbumin hydrolysate and antibiotics were added. The tubes contained 2 ml of medium, and the inoculum was 0.1 ml. Each sample was inoculated in 4 tubes. Blind passages were carried out twice from each negative culture, each time after an incubation period of 7 days at 37C. No isolation was considered positive before typing by neutralization was made. Virus was found bound to particles and was not eluated at pH 9.0 in the samples from activated sludge treatment. The secondary sludge contained less virus than the primary sludge. The isolated virus type were Coxsackie B strains, ECHO strains and Adenovirus strains. Treatment with lime, ferric chloride and aluminum sulfate in experimental scale removed virus from raw sewage so that virus could be demonstrated in the sludge from sewage where virus was not demonstrated. No virus inactivation in the chemical sludges were observed. (Holoman-Battelle)

THE EFFECT OF PRETREATMENTS ON THE VIRUS CONTENTS OF SEWAGE SAMPLES,
Royal Veterinary and Agriculture Coll., Copenhagen (Denmark).
E. Lund.
Water Research, Vol 7, No 6, p 873-879, June 1973. 3 tab, 7 ref.

Descriptors: *Viruses, *Isolation, *Pollutant identification, Methodology, *Activated sludge, *Sewage sludge, Biological treatment, Centrifugation, Sewage, Pollutants, Ethers, Cultures, Domestic wastes, Industrial wastes, Sewage effluents, Storage, Influents.

Identifiers: *Sample preparation, Concentration, Recovery, Coxsackie virus B3, Adenovirus 3, Adenovirus 2, Adenovirus 1, Adenovirus 5, Coxsackie virus B5.

Experiments were conducted to determine the effect of pretreatments (low speed centrifugation, decontamination and 2-phase concentration) of sewage and sluge samples on the recovery of virus from such samples. Five-liter dip samples were collected from two biological treatment plants and the virus isolations were made in tube cultures of HeLa cells. The cells were kept in a medium consisting of 7 percent calf serum in Hanks' solution of which 0.5 percent lactalbumin hydrolysate and antibiotics were added. Each sample was inoculated in 4 tubes using 0.1 ml inocula. The adsorption period was kept at 2 h as a compromise because sludge samples could not safely be allowed longer contact time. Blind passages were carried out twice from each negative or suspected culture; each time an incumbation period of 7 days at 37C was employed. No isolation was considered positive before typing by neutralization was successfully carried out. By isolations of virus from sewage and sluge samples, which had been fractionated by centrifugation at 9000 rev/min, it was found that virus may be particle bound and recoverable in the precipitates. An exception was the secondary sludge of the activated sludge treatment. It was thus indicated that removal of a part of a sewage or sludge sample before examination may make true quantitative estimations impossible. Re-examination of samples after storage at -20C for 6 months gave remarkably poor virus recoveries. (Holoman-Battelle)

REMOTE SENSING OF OIL SLICKS,
S. Axelsson, and E. Ohlsson.
AMBIO, Vol 2, No 3, p 70-76, 1973. 6 fig, 14 ref.

Descriptors: *Oil spills, *Remote sensing, *Pollutant identification, *Environmental effects, *Oil pollution, Aerial photography, Mapping, Thin films, Wind velocity, Films, Water quality, Cloud cover, Sea water, Solar radiation, Water pollution, Pollutants, Photogrammetry.
Identifiers: *Data interpretation, Accuracy, Microwave sensors, Crude oil, Fuel oil, Thermal infrared imagery, Infrared imagery, Marine environment.

The frequent marine oil spills point out the need for effective methods of oil slick detection and surveillance. The most efficient means for localizing a spill and measuring its extent is the use of airborne remote sensing systems. The fundamental relation between the remote sensing signal and oil slick characteristics is investigated. The discussion is based upon results from a study for the Swedish Board for Technical Development. Due to differences between the material properties of oil and water, an oil slick is detectable in most wavelength bands. The capability of mapping thin oil slicks varies with the wavelength used. The amount of cloud cover also has a great influence on the contrast and the optimum wavelength band for mapping. A significant relation also exists between the contrast and the thickness of the oil film in some parts of the spectrum, particularly in the green band, thermal infrared (IR) and the microwave region. The multiband signature is also related to the oil type. The main interpretation problem is that the oil signature is also influenced by environmental parameters like amount of cloud cover, sea state, wind speed, water quality, and attenuation and scattering of the atmosphere. The accuracy of the interpretation is highly improved is information about these parameters is available. Particularly the thickness mapping can be performed more efficiently if it is possible to calibrate the interpretation model by thickness values from a few points of the slick. The quality of the extracted data about the oil slick is also enhanced if information from different wavelength bands is combined. If microwave sensors are included, the system can also operate during all weather conditions. (Holoman-Battelle)

SAMPLING FOR WASTE WATER ANALYZERS. PART I: SYSTEMATIC APPROACH,
Union Carbide Corp., South Charleston, W. Va.
J. W. Sugar, and J. H. Brubaker.
Instrumentation Technology, Vol 20, No 6, p 27-32, June 1973. 6 fig.

Descriptors: *Water sampling, *Instrumentation, Methodology, *Water water (Pollution), *Planning, Water pollution, Water pollution sources, Pollutants, Measurement, Monitoring, Water analysis, Mechanical equipment, Interfaces, Effluents, Streams, Reliability.
Identifiers: *Waste water analyzers, *Sampling equipment, Sample preparation.

A systematic approach to the design of a sampling conditioning system has been suggested for improving the reliability of such a system. Poor instrument reliability is caused primarily by the fouling of the sampling system or malfunction of the analyzer components that are continuously exposed to the polluted samples. Assuming that the correct analyzer has been chosen for a given application, there are 8 aspects of sampling that require in-depth consideration if a functional support package for the instrument is to be assembled. These 8 areas are: measurement objective, sample point, sample probe, pumping system, transfer lines, sample conditioning, analyzer interface (stream selection), and analyzers. (See also W74-00643) (Holoman-Battelle)
W74-00642

SAMPLING FOR WASTE WATER ANALYZERS. PART II: EFFECTIVE APPLICATIONS,
Union Carbide Corp., South Charleston, W. Va.
J. W. Sugar, and J. H. Brubaker.
Instrumentation Technology, Vol 20, No 8, p 39-43, August 1973. 7 fig.

Descriptors: *Water sampling, *Instrumentation, *Prototypes, Waste water (Pollution), Mechanical equipment, On-site tests, Sewers, Prototype tests, Water pollution, On-site data collections, Waste dilution, Interfaces, Water analysis, Pumps, Pumping, Reliability.
Identifiers: *Waste water analyzers, *Stream sample conditioner, *Sampling equipment, Sample preparation, Sample dilution.

A prototype hardware package is described which has been used to verify the sample conditioning system design and conditioning philosophy which were developed in Part I of the study. The portable sample conditioner equipped with a conditioner package which was built for mobility and versatility has been used in field tests. Every function deemed necessary in obtaining the selected conditioning goals can be evaluated with this portable unit. It can handle pressurized sewers, as well as unpressurized ones. Pumps can be interchanged to get the desired lift and head; sample dilution can be performed with clean water at ratios ranging from 2:1 to 30:1. Ratios above 30:1 are possible but uncommon. The sample can be depressurized and repressurized. The unit is also equipped to evaluate the performance of those components in a total carbon analyzer that are in intimate contact with the sample (e.g., sample inject valve, reaction chamber, catalyst and associated components). An infrared analyzer can be connected to the reactor if desired. With this system, alterations can be made in philosophy to correct for poor historical data, lack of experience on a particular type of stream, or simply an incorrect choice of hardware. This prototype can now be loaned to a plant or individual unit for approximately 500-1,000 dollars per application. A 1,000 dollar field test is a good investment when plans are being formulated to install a 30,000 dollar measurement system. This price includes typical costs for a concrete pad, building, heating, plumbing, sample conditioner, and analyzer. Some of the more typical applications such as solids removal and sample dilution are reviewed in some detail. (See also W74-00642) Holoman-Battelle)
W74-00643

BIODEGRADATION OF NITRILOTRIACETATE (NTA) BY BACTERIA-I. ISOLATION OF BACTERIA ABLE TO GROW ANAEROBICALLY WITH NTA AS A SOLE CARBON SOURCE,
Karolinska Institutet, Stockholm (Sweden). Dept. of Applied Microbilogy.
S-O.Enfors, and N. Molin.
Water Research, Vol 7, No 6, p 881-888, June 1973. 3 fig, 4 tab, 17 ref.

Descriptors: *Microbial degradation, *Nitrilotriacetic acid, *Anaerobic conditions, *Isolation, *Aerobic conditions, *Anaerobic bacteria, Aquatic bacteria, Biodegradation, Nutrients, Cultures, Metabolism, Water pollution.
Identifiers: Substrate utilization, Fate of pollutants, Culture media, Enrichment, Characterization, Biochemical characteristics, Bacterial physiology.

An investigation was conducted to determine if bacteria exist that are capable of degrading NTA in oxygen-depleted environments. Mud samples taken from the bottom of sewage contaminated

shallow waters were shaken with water from the collection site and filtered through paper under vacuum. The filtrate was used to inoculate the culture media that were used; a trace element solution containing Zn, Cu, Mn, and Co was also added to these media. Strains of bacteria that were able to utilize nitrilotriacetate under aerobic and anaerobic conditions were isolated from the sampled environment. One of these strains (NTA-A2) is a faculative anaerobe which grows under anaerobic conditions on NTA if nitrate is available in the medium. (Under aerobic conditions this strain can utilize acetate, glucose and some other sugars as well as NTA but not EDTA (ethylenediaminotetraacetate) or lactose as the sole carbon source. The properties and characteristics of the strain NTA-A2 are described. (See also W74-00645) (Holoman-Battelle)
W74-00644

EFFECT OF TEMPERATURE OF INCUBATION ON PERFORMANCE OF MEDIA IN THE DETECTION OF ENTERIC PATHOGENS,
East Jefferson General Hospital, Metairie, La.
W. I. Taylor, and D. Schelhart.
Applied Microbiology, Vol 25, No 6, p 940-944, June 1973. 3 tab, 12 ref.

Descriptors: *Enteric bacteria, *Pathogenic bacteria, *Aerobic bacteria, *Isolation, *Temperature, Salmonella, Shigella, Incubation, E. coli, Cultures, Methodology, Pollutant identification.
Identifiers: *Culture media, Enrichment, Agars, Broths, Edwardsiella tarda, Arizona hinshawii, Providencia, Staphylococcus aureus, Salmonella typhi, Salmonella typhimurium, Salmonella oranienburg, Salmonella infantis, Salmonella blockley, Salmonella java, Salmonella anatum, Salmonella newport, Salmonella thompson, Salmonella heidelberg, Salmonella manhattan, Salmonella mississippi, Salmonella montevidea, Salmonella muenchen, Shigella dysenteriae, Shiegella flexneri, Shigella boydii, Shigella sonnei.

The effect of incubation temperatures on the efficacies of both plating media and transport or enrichment broths was determined by the analysis of 391 diarrheal stools for salmonellae and shigellae. Each analysis resulted in 90 observations. Stool specimens were homogenized in saline and used to inoculate eosin methylene blue (EMB), Salmonella-Shigella (SS), and xylose lysine deoxycholate (XLD) agar plates, Amies and Cary-Blair (CB) transport media, and gram-negative (GN) enrichment broth. All media were incubated at 25, 30, and 35 C for 24 and 48 h. In order of efficacy, GN and saline were significantly better than Amies and CB, which were still better than direct streaking for both salmonellae and shigellae. Forty-eight hours was a significant improvement over 24 h only at 25 C on direct streaking for both pathogens. In direct plating, XLD was better than both SS and EMB for both pathogens. After broths for salmonellae, XLD greater than SS greater than EMB, and for shigellae, XLD greater than EMB greater than SS, with all differences significant. SS agar was significantly improved for detection of shigellae with 48-h broth inocula versus 24-h broth inocula. The differences thus observed at the various temperatures tested proved to be less important than the media used. The efficient media, GN broth, saline-stool, and XLD were shown to be affected very little by either temperature or time variance of the magnitude tested. (Holoman-Battelle)

A STUDY OF LIQUID-MEMBRANE PERCHLORATE-SELECTIVE ELECTRODES MADE FROM AN ORGANIC RADICAL ION SALT,
Umea Univ. (Sweden). Dept. of Analytical Chemistry.
M. Sharp.
Analytica Chemica Acta, Vol 65, No 2, p 405-416, July 1973. 4 fig, 2 tab, 12 ref.

Descriptors: *Aqueous solutions, Water analysis, Anions, Selectivity, Iodides, Nitrates, Sulfates, Bromides, Fluorides, Chlorides, *Electrodes.
Identifiers: *Perchlorates, *Liquid membrane electrodes, *Perchlorate electrodes, *Ion selective electrodes, Detection limits, Response time, Chemical interference, Membrane electrodes, N-ethylbenzothiazole-2 2'-azaviolene perchlorate, Tetrafluoroborate, Hydroxyl ion, Chlorates, Selectivity coefficients, Acetates.

Liquid-membrane electrodes were prepared from solutions of N-ethyl-benzothiazole-2, 2'-azaviolene perchlorate in 1,2-dichlorobenene and in Beta-beta prime dichlorodiethyl ether, and their response and selectivity characteristics were examined. Perchlorate response ranges of the order 1-10 to the minus 6.5 power M and 1-10 to the minus 5.6 power M were shown to be attainable with the two systems, respectively. These values represent significant improvements over the range 1-10 to the minus 4.8 power M found for the solid state electrode made from the same radical ion salt. Short response times and acceptably stable potentials were observed for both liquid-membrane sensors. Both showed high apparant selectivities for perchlorate over all the ten anions tested (I, BF4, OH, NO3, C13, SO4, Br, F, CH, CO2, C1). Iodide and tetrafluoroborate were the most serious interferences in each case. The low interference shown by hydrogen and hydroxide ions indicated that perchlorate determinations may be performed within the pH range 1-12 with both electrodes. (Little-Battelle)

Descriptors: *Anions, *Selectivity, Permselective membranes, Ion exchange, Chlorides, Bromides, Iodides, Nitrates, Equilibrium, *Electrodes.
Identifiers: *Liquid membrane electrodes, *Ion selective electrodes, Tris (1 10-phenanthroline)iron, Tris (4 7-diphenyl-1 10-phenanthroline)iron, Potentiometry, Selectivity coefficients, Organic solvents, Nitrobenzene, Chloroform, N-Amyl alcohol, Thiocyanates, Perchlorates, Fluoroborates, Fluorophosphides, Tetraheptylammonium ion, Calcium electrodes, Tetraheptylammonium nitrate, Tetraheptylammonium ion electrodes, Nitrate electrodes, Perchlorate electrodes, Tetrafluoroborate.

Selectivity coefficients of liquid-membrane electrodes for common inorganic anions were measured in electrodes containing tris (1,10-phenanthroline)iron (II), tris (4, 7-diphenyl-1, 10-phenanthroline)iron (II) or tetraheptylammonium ion in nitrobenzene, and tris (4, 7-diphenyl-1, 10-phenanthroline)iron (II) ion in nitrobenzene, chloroform or n-amyl alcohol as the liquid membrane. With the exception of the amyl alcohol electrode, selectivity coefficients were relatively independent of membrane composition and followed a common sequence of decreasing selectivity: PF6 (minus) greater than C104 (minus) greater than SCN (minus) equivalent to I (minus) equivalent to BF4 (minus) greater than NO3 (minus) greater than Br (Minus) greater than C1 (minus). This sequence parallels the order of increasing anion hydration energy, suggesting that aqueous phase solvation energies play a predominant role in determining electrode selectivity for these ions. Time-dependent behavior of liquid-membrane electrodes on transfer between solutions containing different ions also is desceibed. Instantaneous e.m.f. readings were used to determine selectivity coefficients. (Holoman-Battelle)

ELECTRON MICROSCOPE AND PHYSICAL CHEMICAL CHARACTERIZATION OF C--PHYCOCYANIN FROM FRESH EXTRACTS OF TWO BLUE-GREEN ALGAE,
New York State Dept. of Health, Albany. Div. of Labs. and Research.
M. Kessel, R. MacColl, D. S. Berns, and M. R. Edwards.
Canadian Journal of Microbiology, Vol 19, No 7, p 831-836, July 1973. 3 fig, 1 tab, 30 ref.

Descriptors: *Electron microscopy, *Aquatic algae, Cytological studies, *Cyanophyta, Plant pigments, Fluorescence.
Identifiers: C-phycocyanin, *Plectonema boryanum, *Calothrix parietina, Physical chemistry, *Photosynthetic pigments, Phycobilisomes, Sample preparation, Ultracentrifugation, Phormidium luridum, Sedimentation velocity centrifugation.

The particulate material (intact and dissociated phycobilisomes), adjacent to the thylakoids of Plectonema boryanum and Calothrix parietina, was examined in thin sections and in freshly prepared C-phycocyanin extracts. For the latter a method was developed using speroplasts of log-phase cells. When examined by sedimentation velocity centrifugation, the sedimentation coefficients of the rapidly extracted C-phycocyanin were found to be 18 S and 5 S. Also, a 10-S boundary was observed with P. boryanum. When C. parietina was grown under red light the 18-S aggregates increased to 20 S. The 18 S particles, in electron micrography of negatively stained preparations, displayed eight subunits surrounding a central one. The possibility that some subunits fall out of the plane of view is contemplated in proposing a dodecamer arrangement for such particles. The 20-S particles were also examined by electron microscopy. However, the precise number of monomer units associated with either the 18-S or 20-S particles has not yet been ascertained. Thin sections of intact algal cells are presented to demonstrate the presence of phycobilisomes along the outer faces of the thylakoid membranes. (Holoman-Battelle)

MICROBIOLOGICAL EVALUATION OF COLD-WATER SHRIMP (PANDALUS BOREALIS),
Food and Drug Administration, Boston, Mass.
F. A. Zapatka, and B. Bartolomeo.
Applied Microbiology, Vol 25, No 6, p 858-861, June 1973. 2 tab, 11 ref.

Descriptors: *Shrimp, *Food processing industry, *E. coli, Foods, Coliforms, Path of pollutants, Water pollution sources.
Identifiers: *MPN, *Staphylococcus, Pandalus borealis, Biological samples, Macroinvertebrates.

Samples of shrimp (Pandalus borealis) were collected from fishing boats before unloading and in various stages of processing for determination of most probable numbers of E. coli, coliforms, and

coagulase-positive staphylococci and aerobic plate counts. Methods of the AOAC were used. Freshly harvested shrimp collected from fishing vessels had an APC geometric mean of 510/g; E. coli, coliforms, and coagulase-positive staphyloccocci were absent. Subsequent storage and insanitary practices during processing increased the APC and introduced coliforms. However, the low air temperatures (18 to 45 F) in the plants and the large volumes of cold water (34 F) used during processing inhibited significant bacterial buildup in the finished product. (Little-Battelle)

CLINICAL LABORATORY EXPERIENCE WITH THE IMPROVED ENTEROTUBE,
Long Island Jewish-Hillside Medical Center, New Hyde Park, N.Y.
B. G. Painter, and H. D. Isenberg.
Applied Microbiology, Vol 25, No 6, p 896-899, June 1973. 1 tab, 6 ref.

Descriptors: *Separation techniques, *Enteric bacteria, *Cultures, Methodology, Pullutant identification, Pathogenic bacteria, Coliforms, E. coli, Salmonella, Shigella.
Identifiers: *Enterotube, Method validation, Culture media, Arizona, Citrobacter freundii, Citrobacter diversus, Klebsiella pneumoniae, Enterobacter aerogenes, Enterobacter cloacae, Enterobacter hafniae, Enterobacter liquefaciens, Serratia marcescens, Proteus vulgaris, Proteus mirabilis, Proteus morganii, Proteus rettgeri, Providencia.

The improved Enterotube was tested with 586 representatives of the family Enterobacteriaceae to study its reliability in differentiating these bacteria. Several different media were also used in comparison tests to identify the microorganisms. The results show that the improved Enterotube has the ability to sequester significant reactions which lead to the identification of the various constituents of the family Enterobacteriaceae. Confirmation of the differentiation, especially of salmonellae, shigellae, arizonae, and enteropathogenic escherichiae, by seriological techniques is also suggested. The reactions elicited with the improved Enterotube compare favorably with those obtained with media prepared in the laboratory. The limitations of preparation and standardization, neglected or ignored in laboratories without adequate facilities, personnel, and experience, can be overcome with this type of device. In this study, the improved Enterotube reacted more closely to the findings reported in the percentage tables of Ewing than did the conventional method for the first approximation of the identity of members of the family. (Little-Battelle)

POTENTIAL PATHOGENS IN THE ENVIRONMENT: KLEBSIELLA PNEUMONIAE, A TAXONOMIC AND ECOLOGICAL ENIGMA,
Oregon State Univ., Corvallis. Dept. of Microbiology.
C. Brown, and R. J. Seidler.
Applied Microbiology, Vol 25, No 6, p 900-904, June 1973. 3 tab, 31 ref.

Descriptors: *Isolation, *Pathogenic bacteria, *Pollutant identification, Systematics, Vegetable crops, Seeds, Nitrogen fixing bacteria, Methodology, Aquatic environment, Soil environment, White fir trees, Enteric bacteria, Carrots, Lettuce, Onions, Potatoes.
Identifiers: *Klebsiella pneumoniae, *Serotypes, *Selective media, Biochemical characteristics, Environmental samples, Biochemical tests, Culturing techniques, Mushrooms.

A nitrogen-deficient medium and m-Endo agar were employed in the isolation of members of the tribe Klebsielleae from surfaces of vegetables and seeds. With m-Endo agar at an incubation temperature of 37C, nearly 50 percent of the vegetables and seven out of seven seed samples yielded organisms which biochemically and seriologically were identified as Klebsiella pneumoniae. Viable counts were generally in the range of 1000 cells per g of vegetable peel or seed. Organisms classified as K. pneumoniae exhibited seven different IMViC patterns, with the minus minus plus plus, plus plus plus plus, and minus plus plus plus patterns most common. Seven of the eleven K. pneumoniae serotypes encountered have previously been isolated from human urinary tract and other infections. Fifty percent of the 40 K. pneumoniae examined exhibited positive acetylene-reducing activity, i.e., they possessed the capability for fixing N2. Vegetables containing K. pneumoniae may constitute a potential reservoir for human nosocomial genitourinary or other infections. (Holoman-Battelle)

GENTAMICIN BLOOD AGAR USED AS A GENERAL-PURPOSE SELECTIVE MEDIUM,
Saint Joseph's Hospital, London (Ontario). Dept. of Microbiology.
W. A. Black, and F. Van Buskirk.
Applied Microbiology, Vol 25, No 6, p 905-907, June 1973. 1 tab, 6 ref.

Descriptors: *Isolation, *Pathogenic bacteria, Enteric bacteria, Coliforms, Aerobic conditions, Anaerobic conditions, Incubation, Yeasts, Cultures, Anaerobic bacteria, E. coli, Aerobic bacteria, Pseudomonas, Fungi, Methodology.
Identifiers: *Culture media, *Selective media, *Gentamicin blood agar, Survival, Gram-negative bacteria, Streptococci, Enterococci, Streptococcus viridans, Bacteroides, Clostridium perfringens, Serratia marcescens, Proteus, Staphylococci, Klebsiella, Enterobacter, Acinetobacter, Flavobacterium, Providence.

The potential value of a blood agar medium containing a final concentration of 5.5 micrograms of gentamicin per ml was assessed in a diagnostic laboratory over an 8-week period. Nine hundred sixty-six consecutive clinical specimens submitted to laboratory section were plated on routine culture media and then on one-quarter of a gentamicin blood agar (GBA) plate. In all cases the routine culture media contained 7.5 percent sheep blood agar plates for aerobic and anaerobic incubation and a MacConkey plate. The routine plates were read after 48 h incubation and the GBA plates after overnight incubation. Two hundred twenty-four of the specimens failed to grow on either routine culture media or GBA. The medium gave increased isolation rates of beta-hemoytic streptococci, other streptococci, Bacteroides, clostridia, and yeasts. Gentamicin-resistant gram-negative bacteria isolated only on GBA included 20 (26 percent) strains of Bacteroides and 10 (77 percent) strains of Providence. Gentamicin resistant gram-negative bacteria isolated on both GBA and routine culture media included three strains of Kebsiella-Enterobacter, and six strains of Serratia marcescens. GBA inhibited the growth of most strains of staphylococci and Klebsiella-Enterobacter, and all strains of Escherichia coli and Pseudomonas. (Holoman-Battelle)
W74-00657

IDENTIFICATION OF THE PROTOTHECA SPECIES BY IMMUNOFLUORESCENCE,
North Carolina Univ., Chapel Hill. School of Public Health.
M. S. Sudman, and W. Kaplan.
Applied Microbiology, Vol 25, No 6, p 981-990, June 1973. 2 fig, 6 tab, 22 ref.

Descriptors: *Pathogenic fungi, *Pollutant identification, Speciation, Chlorella, Methodology.
Identifiers: *Fluorescent antibody techniques, *Immunofluorescence, *Prototheca, Chromogenic reagents, Fluorescein isothiocyanate, Sample preparation, Prototheca filamenta, Prototheca moriformis, Prototheca stagnora, Prototheca wickerhamii, Prototheca zopfii, Prototheca pastoriensis, Prototheca chlorelloides, Prototheca trispora, Prototheca urbrizsyi, Coccidoides immitis, Blastomyces dermatitidis, Cryptococcus neoformans, Paracoccidioides brasiliensis.

Studies were carried out to develop fluorescent antibody reagents for the identification of the Prototheca species and for their differentiation from morphologically similar fungi of various genera in formalin-fixed tissues. Antisera against representative isolates of P. filamenta, P. moriformis, P. stagnora, P. wickerhamii, and P zopfii were produced in rabbits. Antiglobulins, labeled with fluorescein-isothiocyanate that intensely stained most cells of the homologous species, were selected for use as potential diagnostic reagents. By adsorbing the conjugates with selected heterologous cross-straining protothecae, reagents that were both sensitive and specific were obtained. Evaluation of the adsorbed conjugates with sections of tissue infected with protothecae, sections of tissue infected with morphologically similar fungi, and cultures of protothecae showed that these reagents are useful for the rapid and reliable identification of the Prototheca species. (Holoman

THE DETECTION OF CLOSTRIDIUM WELCHII IN THE DIFFERENTIAL REINFORCED CLOSTRIDIAL MEDIUM TECHNIQUE,
Ministry of Agriculture, Belfast (Northern Ireland).
P. A. Gibbs.
Journal of Applied Bacteriology, Vol 36, No 1, p 23-33, March 1973. 5 tab, 16 ref.

Descriptors: *Isolation, *Pollutant identification, Methodology, *Poultry, Anaerobic bacteria, Cultures.
Identifiers: *Differential reinforced clostridial medium, *Clostridium welchii, Poultry processing plants, Culture media, Clostridium bifermentans, Swab sampling, Counts, Animal tissues.

Studies were made to investigate the sensitivity of the DRCM (Differential Reinforced Clostridial Medium) techniques for isolating Clostridium welchii and to determine whether the method could be made more sensitive without increasing unduly the length of time necessary to obtain a result. Swab samples were taken of working surfaces and equipment and carcass samples from poultry processing plants. Water samples from one plant were taken from spinchillers and from a giblet washer. All DRCM cultures confirmed positive were streaked on lactose-egg yolk-milk (LEYM) medium for identification. Cultures of known strains of C1. welchii and C1. bifermentans were grown separately at 37 degrees in cooked meat broth. Microscopic counts and a total viable count using the pour plate technique with a tryptone-yeast extract (TYE) agar were made. Mixtures of the two bacteria were cultured using DRCM, incubated at 37 degrees for 48 h and scored positive or negative. All positives in the 'presumptive total' DRCM count, in the completed 'total' count, and in the spore count were streaked on LEYM for identification. Although the DRCM method can detect low numbers of clostridia, the detection of C1. welchii requires that all positive DRCM cultures in the 'presumptive total' count be examined before heat treatment for the presence of this species, and the LEYM agar medium affords a simple method for doing this. Data obtained on sampling 3 sites on each of 30 carcasses from the 3 processing plants showed that the vent and neck sites of carcasses from each plant had a markedly higher rate of contamination with clostridia than the breast, both in the 'total' count and in the spore count. SAMPLING AND ANALYSIS OF CHEMICAL POLLUTANTS IN RIVER WATER,
Lee Conservancy Catchment Board (England).
D. C. Hinge.
Chemistry and Industry, No 15, p 727-732, August 4, 1973. 3 fig, 1 tab, 14 ref.

Descriptors: *Water analysis, *Pollutant identification, *Analytical techniques, *Monitoring, Rivers, Europe, *Water quality control, Water law, Legislation, Regulation, Computers, Automation, Instrumentation, Legal aspects, Hydrologic data, Testing procedures, Governments, Administration, Data processing.
Identifiers: Regional governments, *United Kingdom, Great Britain, Lee River.

In the United Kingdom, impetus for regional river authorities to provide facilities for monitoring stream quality came largely from the Rivers (Prevention of Pollution) Acts passed in 1951 and 1961, and the Water Resources Act of 1963. The work performed by the Lee Conservancy Catchment Board on the Lee River and its tributaries in a 500 square mile area with a population of about two million studies being conducted. Particular attention is being paid to nitrates and pesticides. Manual and instrumental techniques used are indicated, including gravimetry, colorimetry, titrimetry, electrochemical analysis, chromatography, atomic absorption spectroscopy/flame photometry, and other methods for routine determinations of suspended solids, sulfate, nitrogen and phosphorus compounds, detergents, herbicides, dissolved oxygen, and various metal trace elements. Future trends, started with the AutoAnalyzer, will include data collection and interpretation aided by computers. (Brown-IPC)

ANALYSIS OF WASTE WATERS AND INTERPRETATION OF THE RESULTS,
Imperial Chemical Industries Ltd., Billingham (England). Agricultural Div.
A. C. Docherty.
Proceedings of the Society for Analytical Chemistry, Vol 10, No 8, p 201-202, August 1973.

Descriptors: *Water analysis, *Analytical techniques, *Pollutant identification, *Monitoring, Toxicity, *Biochemical oxygen demand, Water pollution, *Industrial wastes, *Municipal wastes, Stream improvement, Rivers, Estuaries, Foreign countries, Waste water treatment, Instrumentation, Pollutants, Effluents, Fish, Ammonia, Zinc, Iron compounds, Chlorine, Chlorine compounds, Phenol, Ammonium compounds, Waste dilution, Persistence.
Identifiers: Total organic carbon (TOC), Continuous processes, Tees River (England), United Kingdom, British Water Research Association, Instrumental analysis, Cyanides, Chlorophenols, Hypochlorites, Synergism.

Pollution of the Tees Estuary is being reduced by a joint industry/local authority program that promises to halve the effluent pollution loads by 1975 and to lure fish back into the Tees River. Problems of waste water sampling, analysis, and data interpretation are illustrated. Simultaneous presence of several pollutants may cause either additive or cancelling effects. Thus, ionized ammonium salts in acid solution are nontoxic to fish, but can produce unionized ammonia, which is highly toxic, when the water pH approaches alkalinity. Similarly, the interaction of phenol with hypochlorite, both toxic, forms chlorinated phenol that is not only more toxic but also more odorous and more persistent than either reactant alone. By contrast, highly toxic cyanide, when complexed by iron, may form the much less toxic hexacyanoferrate ion. Limited monetary resources may, in addition, force a choice between alternative treatments, e.g., whether to eliminate cyanide (which is readily degraded biologically when diluted) or the less toxic zinc (which is, however, quite persistent in the environment, regardless of dilution). An instrumental method for the continuous monitoring of TOC (total organic carbon), developed by ICI Ltd. and the British Water Research Association, is recommended in lieu of the tedious five-day BOD test which is unsuited for the speedy characterization of industrial effluents. (Brown-IPC)
W74-00779

THE IDENTIFICATION OF SOURCES OF OIL SPILLS,
Laboratory of the Government Chemist, London (England).
D. M. Green, and J. Roburn.
Proceedings of the Society for Analytical Chemistry, Vol 10, No 8, p 202-203, August 1973.

Descriptors: *Oil spills, *Analytical techniques, *Pollutant identification, *Water pollution sources, Oil, Oil pollution, Fuels, Chromatography, Gas chromatography, Chemical analysis, Flame photometry, Mass spectrometry, Separation techniques, X-ray fluorescence, Spectroscopy, Sulfur compounds, Nickel, Evaporation, Weathering, Sampling, Organic compounds.
Identifiers: Molecular sieve chromatography (or Gel filtration), Fractionation, Vanadium, Isoprenes, Phytane, Pristane, Thiophenes, Naphthalenes, Atomic absorption spectroscopy, Hydrocarbons, Alkanes (or Aliphatic hydrocarbons).

Analytical techniques for tracing the sources of oil spills can greatly aid in the enforcement of water pollution laws. Temperature-programmed gas-liquid chromatography (GLC) with a packed column, nonpolar stationary phase, and flame-ionization detector gives hydrocarbon profiles which indicate the type of oil (crude, fuel, or tanker sludge). More specific characterizations can be obtained by separation of isoprenoid alkanes, phytane, pristane, and its 18-carbon homolog, using fractionation on Sephadex LH-20 columns plus gel filtration on silica gel and 5A molecular sieve. A few crude oils that are difficult to resolve by isoprenoid ratios, particularly after weathering, have been characterized by their vanadium and nickel contents, determined directly by x-ray fluorescence and atomic-absorption spectroscopy. Among other supporting evidence, distinct GLC profiles for many crude oils in combination with mass spectroscopy showed the presence of dibenzothiophenes having 11-15 carbon atoms and sufficiently high boiling points to limit evaporative losses, while C11-C13 naphthalenes were less useful for confirmatory analysis. Capillary gas chromatography can resolve mixtures of isoprenoids without prior separation, but given inferior reproducibility and is impractical for samples as small as 2-3 mg. For source identification of fuel oils, which vary much more in chemical composition, the availability of a suspect sample is essential. (Brown-IPC)

PROPOSAL OF A SIMPLIFIED MANOMETRIC METHOD FOR MEASURING BIOCHEMICAL OXYGEN DEMAND -- RESULTS AND PROBLEMS (VORSCHLAG EINER VEREINFACHTEN MANOMETRISCHEN METHODE ZUR MESSUNG DES BIOCHEMISCHEN SAUERSTOFFBEDARFS -- ERGEBNISSE UND P ROBLEME),
Institut fuer Zellstoff und Papier, Heidenau (East Germany).
H. Schmidt, and G. Weigt.
Zellstoff und Papier, Vol 21, No 5, p 131-140, May 1972. 8 fig, 6 tab, 17 ref.

Descriptors: *Biochemical oxygen demand, *Testing procedures, *Analytical techniques, *Water analysis, Laboratory tests, Instrumentation, Laboratory equipment, Kinetics, Foreign research, Waste water (Pollution), Water pollution, Organic loading.

A modified Warburg apparatus, called 'Biometer', is used in BOD determinations requiring only 2-4 days for complete decomposition of organic matter, compared to 5-7 days using the standard dilution method. The apparatus is rugged, inexpensive, and easy to operate with satisfactory (2-4%) accuracy, provided constant test conditions are maintained, including effluent composition. Optimum operating conditions were established after studies of variables involved. Kinetic studies indicated the conditions under which a reaction of the first order can be expected. Examples of BOD calculations based on short-term rate constant measurements are given. (Speckhard-IPC)

Identifiers: River and Harbor Act.

Stricter enforcement of the 1899 River and Harbor Act required applications for discharge permits to be filed with the U.S. Corps of Engineers by July 1, 1971, listing analytical details on industrial outfalls. Paper mills unprepared to meet the deadline requested help from the Institute of Paper Chemistry (Appleton, Wis.), where a team of experts wrestled with the sampling and analytical problems imposed by the instability and mutual interference of some stream components. Using grab samples in addition to continuous samplers, specific preservatives (which are listed), and modified quantitative methods, the needed data were successfully suppled. Thus, interferences in the Nessler ammonia test were avoided by adopting the phenate method. A special charcoal ('-Nuchar C-190N') decolorized samples with minimum loss of nitrate. Interferences in the phenol red method of bromide analysis were removed by acid digestion followed by alkaline ignition of samples. Sulfides which caused atypical colors in phosphate determinations were removed with bromine water. Omission of the neutralizing step in the single-reagent method avoided formation of difficult to filtered precipitate in total phosphorus analyses. Mutual interference between sulfite and sulfide was minimized by selective absorption of sulfur dioxide before determining sulfides, and by precipitating sulfide prior to sulfite determinations. Although pulp mill effluents showed high phenol contents, not all phenolic compounds may contribute to objectionable odor and tast of receiving waters. (Brown-IPC)

Identifiers: Waste identification, Derivative formation, Clean-up, Case histories, Kuderna-Danish Evaporator.

Experiences during five years of evaluating the application of gas chromatography-mass spectrometry (GC-MS) to wastewater analysis at the Southeast Environmental Research Laboratory have resulted in the selection of recommended practices for such applications. Liquid-liquid extraction with solvents such as methylene chloride and chloroform removed greater than 50 percent of compounds found in pulp mill and petrochemical waste at concentrations of 2 microgram/l to 20 microgram/l. The Kuderna-Danish evaporator was the most effective means of concentration after extraction. Diazomethane and dimethyl sulfate proved to be the most effective of five methylation reagents studied. Packed columns were effective for gas chromatography of simple mixtures and SCOT columns provided better overall performance for complex mixtures. Computerized data reduction was essential for practical use of GC-MS for samples containing many compounds. A computerized spectra matching program proved highly effective in identifying compounds contained in the computer library. The system was shown to be effective in solving problems related to fishkills caused by pesticides, confirmation of polychlorinated biphenyl residues in water and identification of compounds discharged by over a dozen industries. Over two hundred compounds were identified in industrial effluents. (EPA)

Descriptors: *Detergents, *Absorption, Analytical Techniques, Neutron Activation Analysis, *Nitrilotriacetic acid, *Pollutant identification, Trace elements, *Bottom sediments, Suspended solids, Sediments, Metals.

An experimental investigation was made of the possible interaction of residual concentrations of nitrilotriacetic acid in surface waters with metallic elements contained in sediments and bottom materials. Samples of bottom materials from typical bodies of surface waters were analyzed for their major, minor, and trace constituents. Eight representative samples of these were equilibrated with distilled water and with water containing 20 ppm of NTA and the resulting solutions were analyzed by three analytical techniques. Elements showing essentially no increased solubility in the presence of NTA were: barium, antimony, molybdenum, strontium, chromium, silver, tin, iron, lead, cadmium, copper, and mercury. Elements showing small increases in solubility were: nickel, zinc, manganese, and cobalt. Calcium and magnesium concentrations. (EPA)

THE DEVELOPMENT AND PRELIMINARY APPLICATION OF AN INVARIANT COUPLED DIFFUSION AND CHEMISTRY MODEL,
Aeronautics Research Associates of Princeton, Inc., N.J.
G. R. Hilst, C. D. Donaldson, M. Teske, R. Contiliano, and J. Freiberg.
Available from NTIS, Springfield, Va. 22151 NASA CR-2295 Price $3.75 ($6.25 foreign) printed copy; $1.45 microfiche. National Aeronatics and Space Administration Contractor Report NASA CR-2295, September 1973. 82 p, 25 fig, 2 tab, 2 append. NASA Contract NAS1-11433.

Descriptors: *Atmosphere, *Aircraft, *Fallout, Chemical reactions, Model studies, Turbulent flow, Winds, Ozone, Diffusion, Kinetics, *Air pollution.
Identifiers: *Aircraft exhaust, Stratospheric wake.

The development of invariant models (second-order closure) of diffusion and chemical reactions in turbulent air flow system is described. One of the objectives has been to provide guidance for the design of a possible NASA program for in situ measurements of SST exhaust products at cruise altitudes (about 20 km) and, eventually, to use the models for data analysis and interpretation. An approximate closure scheme for a chemical kinetic submodel which conforms to the principles of invariant modeling and which accounts for the effects of inhomogeneous mixing over a wide range of conditions has been developed. This submodel has been coupled successfully with invariant turbulence and diffusion of two reacting (isothermally) chemical species. The initial calculations indicate the ozone reactions in the wake of stratospheric aircraft will be substantially affected by the rate of diffusion of ozone into the wake, and in the early wake, by unmixedness. GROUND WATER, A RESOURCE TO BE PROTECTED,
Minnesota Dept. of Natural Resources, St. Paul.
R. L. Herbst.
In: Proceedings of Conference on Toward a Statewide Ground Water Quality Information System and Report of Ground Water Quality Subcommittee, Citizens Advisory Committee, Governors Environmental Quality Council: University of Minnesota Water Resources Research Center Mimeographed Report, p 8-10, February 1973. 14-31-0001-3823.

Descriptors: *Water resources development, *Water pollution control, *Groundwater, *Minnesota, Conferences, Water management (Applied), Data collections, Hydrologic data, Hydrogeology, Information exchange.

In the next few years, critical water resource decisions must be made in Minnesota. The availability and occurrence of water and the present and future water needs must be determined in sufficient detail to provide guidance to policy objectives. Policies must be implemented through a coordinated effort of all levels of government. The legal framework necessary for the management of water resources must be built. Responsibilities for the management, development, and coordination of State water programs must be specified within a simplified framework. (See also W73-09113) (Knapp-USGS)

In: Proceedings of Conference on Toward A Statewide Ground Water Quality Information System and Report of Ground Water Quality Subcommittee, Citizens Advisory Committee, Governors Environmental Quality Council: University of Minnesota Water Resources Research Center Mimeographed Report, p 35-58, February 1973. 6 fig, 8 ref. 14-31-0001-3823.

Descriptors: *Path of pollutants, *Groundwater movement, *Water chemistry, Minnesota, Monitoring, Underground waste disposal, Waste disposal wells, Water pollution sources, Water pollution effects.

The chemical quality of groundwater will reflect the geochemical material it has been in contact with, the path it has followed underground, the residence time spent in the subsurface, and the initial quality of the water upon entering the aquifer system. In much the same way the system interacts with manmade contaminatns. It is, however, subjected to chemical and hydrologic stresses that may go beyond the self-regulatory capacities of the system and cause irreversible damages. The two principal processes that bear on groundwater quality deterioration are hydraulic transport and dispersion which physically moves contaminants into and through the groundwater reservoir, and physicochemical reactions. A small source of highly concentrated contaminants can pollute very large quantities of groundwater. The effect of the reaction processes is in general that of decontamination and purification of waste water. The purifying capabilities have to be known in order to properly assess the role of the underground in determining water quality. The main processes occurring are mechanical filtration, sorption, ion exchange, oxidation, biochemical stabilization and microbial decomposition, chemical precipitation and coprecipitation as well as gas exchange. Proper planning and management are needed to prevent or minimize deterioration. Once an understanding of the workings of the system has been obtained and certain social, environmental and economic goals have been incorporated into a management plan, it becomes necessary to monitor the system to see whether objectives are met. GROUND WATER POLLUTION PROBLEMS IN MINNESOTA,
Minnesota Pollution Control Agency, Minneapolis. Div. of Water Quality.
D. Wikre.
In: Proceedings of Conference on Toward A Statewide Ground Water Quality InformationSystem and Report of Ground Water Quality Subcommittee, Citizens Advisory Committee, Governors Environmental Quality Council: University of Minnesota Water Resources Research Center Mimeographed Report, p 59-78, February 1973, 9 fig, 12 ref. 14-31-0001-3823.

Descriptors: *Water pollution sources, *Groundwater, *Minnesota, *Path of pollutants, Groundwater movement, Sewage disposal, Waste water disposal, Water pollution control.

One of Minnesota's most important and abundant natural resources is its high quality water, both surface and underground. In recent years there has been a great deal of concern over the deteriorating quality of lakes and rivers. Problems involving municipal and industrial discharges are continually in the news. Large sums of money are being spent to clean up and protect the State's surface waters. During the same period, concern for groundwater quality has been increasing but at a slower rate. This may be because there are a smaller number of groundwater pollution problems in Minnesota. However, the main reason for lack of concern is the fact that the pollution is not visible. After the contamination has entered the ground, it may go undetected for years, until it appears in wells some distance from the original point of contamination. Most groundwater pollution problems can be grouped into six classes. These are problems resulting from individual sewage disposal systems, from agricultural practices, from municipal waste disposal practices, industrial waste disposal practices, petroleum products spills and leaks, and from the use of disposal wells. W74-00570

ESTABLISHING THE IMPACT OF AGRICULTURAL PRACTICES ON GROUNDWATER QUALITY,
Minnesota Univ., Minneapolis. Dept. of Soil.
R. G. Gast, and P. R. Goodrich.
In: Proceedings of Conference on Toward A Statewide Ground Water Quality Information System and Report of Ground Water Quality Subcommittee, Citizens Advisory Committee, Governors Environmental Quality Council: University of Minnesota Water Resources Research Center Mimeographed Report, p 79-91, February 1973. 1 fig, 4 tab, 9 ref. 14-31-0001-3823.

Descriptors: *Water pollution sources, *Groundwater, *Farm wastes, *Fertilizers, Nitrogen, Water quality, Nitrates, Water pollution.
Identifiers: Groundwater pollution.

Agricultural croplands constitute about 35% of the total land area of the State of Minnesota and consequently overlay extensive groundwater reserves. Agricultural practices on these lands often involve application of large quantities of herbicides, pesticides, and nitrogen, phosphorus and potassium in fertilizers and animal wastes which pose potential threats to groundwater quality. All of these materials except nitrogen are strongly absorbed by the soil and pose little threat to groundwaters. Nitrogen (as nitrate) is mobile and will move into groundwaters if allowed to accumulate in the soil. Optimum crop yields can be sustained without nitrate accumulations in the soil if proper fertilization rates are used. If animal wastes are concentrated in a small area, they may move almost directly into the groundwater by such mechanisms as sinkholes and defective well casings or by saturated flow through soils. Contamination of groundwaters from such sources can be minimized by locating larger operations con-

sistent with proper soil and hydrologic conditions. (See also W73-09113) (Knapp-USGS)

DISSOLVED ALUMINUM IN ACID SULFATE SOILS AND ACID MINE WATERS,
Agricultural Univ., Wageningen (Netherlands). Dept. of Soil and Science and Geology.
N. Van Breemen.
Soil Science Society of America Proceedings, Vol 37, No 5, p 694-697, September-October 1973. 2 fig, 1 tab, 16 ref.

Descriptors: *Sulfates, *Acid mine water, *Soil chemistry, Aluminum, Hydrogen ion concentration, Water pollution effects, Water pollution sources, Acidic soils, Saline soils.

Analytical data on water samples from acid sulfate soils and acid mine spoils indicate that the upper limit of dissolved Al is regulated by a basic aluminum sulfate with the stoichiometric composition AlOHSO4. The observed solubility relationship, pAl + pOH + pSO4 ± 17.23, can be useful in defining environmental conditions in terms of pH and dissolved sulfate for the occurrence of Al concentrations toxic to plants. BIOMAGNIFICATION OF P,P'-DDT AND METHOXYCHLOR BY BACTERIA,
Bureau of Sport Fisheries and Wildlife, Columbia, Mo. Fish-Pesticide Research Lab.
B. T. Johnson, and J. O. Kennedy.
Applied Microbiology, Vol 26, No 1, p 66-71, July 1973. 3 fig, 3 tab, 19 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, Aquatic bacteria, Radioactivity techniques, Soil bacteria, Pesticide residues, Biomass, Insecticides, *DDT, Aerobic bacteria, Anaerobic bacteria.
Identifiers: *Biological mangification, p p' DDT, *Methoxychlor, *Bacillus subtilis, *Aerobacter aerogenes, Bioaccumulation, Chemical recovery.

Strains of Aerobacter aerogenes and Bacillus subtilis were exposed to 1 ppm C-14-labeled DDT or methoxychlor in distilled water to determine uptake kinetics and retention of the pesticides. The bacteria accumulated p,p'-DDT and methoxchlor directly from water. Uptake of both C-14-labeled organochlorine insecticides was rapid; 80 to 90 percent of the 24-h residues were reached with 30 min. Total cellular residues varied linearly with concentrations of DDT and methoxychlor in water ranging from 0.5 to 5.0 micrograms/liter. The residue magnification factors from water were between 1,400- to 4,300-fold, but were independent of insecticide concentrations in water. When the insecticide-exposed microbial cells were washed with pesticide-free water, DDT residues were 45 percent in A. aerogenes and 30 percent in B. subtilis, whereas the methoxychlor level decreased nearly 75 percent in both organisms. Subsequent washing did not further reduce the insecticide residue. Autoclave-killed bacteria also rapidly adsorbed DDT and methoxychlor from water and, in some instances, residues were higher than in the living cells. Molecular polarity and lipid solubility appear to influence the retention of the organochlorine insecticides by bacterial cells. (Holoman-Battelle)

BACTERIAL ENDOTOXINS IN THE ENVIRONMENT,
Tulane Univ., New Orleans, La. Dept. of Physiology.
N. R. Di Luzio, and T. J. Friendmann.
Nature, Vol 244, No 5410, p 49-51, July 6, 1973. 1 tab, 23 ref.

Descriptors: *Ecological distribution, *Potable water, Environment, *Cities, *Municipal water, Milk, Natural streams, Saline water, Surface waters, Artesian wells, Sodium chloride, Aqueous solutions, Toxins, Aquatic environment, Gulf of Mexico, Mississippi River, Deep water, Potomac River, Colorado River, Lake Michigan.
Identifiers: *Beverages, Biological fluids, *Bacterial endotoxins, Distilled water, Pure water, Dextrose, Baltimore, Chicago, Denver, Galveston, Harrisburg, Hazelton, Kalamazoo, Knoxville, Las Vegas, Little Rock, Los Angeles, Memphis, Mobile, Nashville, New Orleans Riverside, San Francisco, Washington, D.C., Barataria Bay, Little Dauphin Island Bay, Fort Loudoun Lake, Mexico City, Cumberland River, South Platte River, Bear Creek, Hetchy Reservoir, Lake Mead, Lake Maumelle, Lake Winnoa, Mammouth Lake.

Studies were conducted to compare the Gram negative endotoxin content of New Orleans water with that of other cities, as well as the endotoxin distribution in various beverages and biological fluids. Tap water was obtained from various cities and placed in sterile vials. The lysate used was E-Toxate; studies were also carried out with lysate prepared in the laboratory. Samples from cities such as Memphis and Kalamazoo, which derive their water from Artesian wells, were consistently negative. Galveston was an exception to this group. Samples from all other sources were positive. To determine the actual concentrations of endotoxins, samples were serially diluted and duplicate determinations carried out. Tap water in New Orleans and Mobile contained 1 microgram/ml endotoxin compared with 10 micrograms/ml in Denver and San Francisco samples. Surface water samples from the Mississippi River at New Orleans contained 128 micrograms endotoxin per ml whereas samples from deep levels (the source of tap water) contained approximately 400 micrograms/ml. A sample of water from the Gulf of Mexico contained 400 micrograms/ml endotoxin whereas samples from bays off the coast of Louisiana and Alabama contained only 20 micrograms/ml. Tests carried out on biological fluids and beverages showed that chemically pure water, 5 percent dextrose, and sodium chloride solutions were negative for endotoxin. Random samples of beer, cola drinks and wine were also negative. One sample of locally obtained commercial bottled water was positive, but another brand, derived from a 2,000 foot deep Artesian well, was negative. In contrast, Mexico City tap water had an endotoxin content of 800 micrograms/ml. Endotoxin was also found in milk samples from New Orleans. The range was 30 to 130 micrograms/ml. The endotoxin content rose sixteen-fold when milk was maintained at room temperature for 24 h with concomitant bacterial proliferation. No endotoxin alteration was observed when the samples were refrigerated. (Holoman-Battelle)

CONDITION OF COLIFORM ORGANISMS INFLUENCING RECOVERY OF SUBCULTURES ON SELECTIVE MEDIA,
Nebraska Univ., Lincoln. Dept. of Food Science and Technology.
R. B. Maxcy.
Journal of Milk and Food Technology, Vol 36, No 8, p 414-416, August 1973. 1 tab, 13 ref.

Descriptors: *E. coli, *Heat resistance, *Stress, Radiation, Sodium chloride, Bioindicators, Coliforms, Sewage bacteria, Cultures, Sewage, Public health.
Identifiers: *Sensitivity, *Selective media, Enrichment, Differential media, Culture media, Enterobacter aerogenes.

The purpose was to determine whether stress treatments, such as are encoutered in food processing, influence subsequent cultures of coliforms and to study the conditions required for the progeny to regain normal resistance to selective components of media. Enterobacter aerogenes and one strain of E. coli from a culture collection were subjected to heat, radiation, and sodium chloride after which they were grown on plating media. Colonies were then randomly picked and grown in nutrient broth for further comparison of their ability to form colonies on plate count and violet red bile agar. After 6 hr in nutrient broth, average counts on violet red bile agar were less than half those obtained with plate count agar. Sensitivity to the selective medium was lost by repeated transfer and growth in nutrient broth or by repeated picking from the selective medium and subculture of colonies. Cultures with moderate sensitivity to violet red bile

agar were obtained from raw sewage through picking of colonies from plate count agar. Attempts to obtain a stable sensitive strain through selective enrichment were unsuccessful. A laboratory strain of E. coli, with extreme sensitivity to violet red bile agar, however, was used to determine that tolerance was acquired by stepwise adaptation to a selective medium. Occurrence of sensitive coliform cells in nature indicates their potential importance in tests for indicator organisms of public health significance. (Little-Battelle)

MOLECULAR RELATIONSHIPS AMONG THE SALMONELLEAE,
Walter Reed Army Inst. of Research, Washington, D.C.
J. H. Crosa, D. J. Brenner, W. H. Ewing, and S. Falkow.
Journal of Bacteriology, Vol 115, No 1, p 307-315, July 1973. 3 fig, 4 tab, 23 ref.

Descriptors: *Salmonella, *Enteric bacteria, *Pollutant identification, Biological properties, Classification, Cytological studies, Radioactivity techniques, Aerobic bacteria, E. coli, Proteins, Systematics.
Identifiers: *Deoxyribonucleic acid, *Genome, *Chemotaxonomy, Biochemical characteristics, Polynucleotide sequences, Culture media, Proteus mirabilis, Arizona.

Polynucleotide sequence relatedness studies were carried out to determine the extent of divergence present in members of the tribe Salmonelleae and between salmonellae and other enteric bacteria. Cultures of bacteria were maintained on meat extract of nutrient agar slants. Brain-heart-infusion broth (Difco) was used for routine cultivation of organisms on a dry air rotary shaker at 37 C. For labeling DNA, log-phase cells were suspended in a tris (hydroxymethyl) aminomethane-glucose medium lacking phosphate salts and containing 0.05 percent brain-heart-infusion broth. Carrier-free H3P-3204 (10-15 mCi) was added, and the cultures were incubated at 37C with shaking for 16 to 18 h. Both labeled and unlabeled deoxyribonucleic acid (DNA) were prepared by a modification of the method of Berns and Thomas (1969). The estimation of the genome sizes in test organisms was accomplished essentially as described by Gillis, et al. with some modifications. Typical Salmonella were 85 to 100 percent related. Two groups of biochemically atypical Salmonella showed somewhat lower binding to typical salmonellae and to each other. Arizona were 70 to 80 percent related to salmonelleae. Two groups of Arizona were detected. These groups correlated with the presence of monophasic or diphasic flagellar antigens. Salmonella and Arizona were no more related to Citrobacter than to Escherichia coli (45-55 percent). Relatedness of Salmonella and Arizona to other enterobacteria ranged from 20 to 40 percent with klebsiellae and shigellae, to 20 to 25 percent with erwiniae, and to less than 20 percent with edwardsiellae and Proteus mirabilis. OXIDATION OF POLYCHLORINATED BIPHENYLS BY ACHROMOBACTER PCB,
California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
M. Ahmed, and D. D. Focht.
Bulletin of Environmental Contamination and Toxicology, Vol 10, No 2, p 70-72, August 1973. 2 fig, 1 tab, 2 ref.

Descriptors: *Oxidation, *Polychlorinated biphenyls, *Microbial degradation, Metabolism, Cultures, Manometers.
Identifiers: *Achromobacter, Dechlorination, Biotransformation, Fate of pollutants.

Resting cell suspensions of Achromobater pCB, which were grown on PCB, were used in tests to determine their ability to metabolize 2,3-DCB, 2,4-DCB, 3,4-DCB, 3,5-DCB, 3,3'-DCB, 3,4,2'-TCB, 2,3,2',3'-TCB, 2,5,3',4'-TCB, and 2,3,4,5,6-PCB. Rates of metabolism were determined manometrically. All compounds except 2,5,3',4'-TCB were oxidized by the organisms. Spectrophotometric analysis of supernatant solutions revealed no chlorides indicating that the organism was unable to dehalogenate the compounds. (Little-Battelle)
W74-00632

MONITORING OF DUMPING BY MEANS OF SATELLITE REMOTE SENSING,
Environmental Research Inst. of Michigan, Ann Arbor.
C. T. Wezernak, and F. J. Thomson.
AMBIO, Vol 2, No 3, p 84-86, 1973. 5 fig, 6 ref.

Descriptors: *Remote sensing, *Monitoring, *Oceans, *Waste disposal, Suspended solids, Sewage sludge, Acidic water, Data processing.
Identifiers: *ERTS, Data interpretation, Multispectral scanner.

Data from the Earth Resources Technology Satellite (ERTS) have been analyzed to evaluate the feasibility of monitoring waste disposal in the oceans. A multispectral aircraft mission was also included to corroborate the results obtained from the ERTS data. ERTS data were obtained at four spectral bands from 0.5 to 1.1 micrometers and clearly show that sewage sludge, acid waste, suspended solids, and major water mass boundaries are observable. The relative depths and dimensions of the waste and dispersal patterns can be determined from the data. It is concluded that satellite remote sensing of large scale events such as ocean dumping is a potential monitoring technique. (Little-Battelle)

Identifiers: Substrate utilization, *Culture media, *Degradation rates, Selective media, Characterization, Bacterial physiology.

A nitrilotriacetate (NTA) degrading bacterium which can grow in a salt medium with NTA as the sole carbon source has been cultivated aerobically and anaerobically in a fermentor. The organism needs nitrate for anaerobic growth. The degradation rate is very low during an adaption phase of 40-80 h after onset of anaerobic conditions, but after this the degradation rate increases. Degradation of NTA is accompanied by a pH increase but the cell density increases less than could be expected from the amount of NTA consumed. Traces of nitrite are produced and the concentration reaches a peak when the conditions are changed from aerobic to anaerobic. (See also W74-00644) (Holoman-Battelle)

Identifiers: Biosynthesis, *Nitrosamines, Aerobacter aerogenes, Proteus vulgaris,

Streptococcus epidermidis, Bacillus subtilis, Arthrobacter, Nocardia, Aspergillus niger, Aspergillus oryzae, Montierella parvispora, Zygorhynchus moelleri, Trimethylamine, Dimethylamine, N-nitrosodiphenylamine, Diphenylamine, Dialkylamines, Dimethylnitrosamine, Cryptococcus.

Several microorganisms (Aerobacter aerogenes, Proteus vulgaris, Streptococcus epidermidis, Bacillus subtilis, E. coli, Arthrobacter sp., Nocardia sp., Cryptococcus sp., Pseudomonas sp., Aspergillus niger, Aspergillus oryzae, Mortierella parvispora, and Zygorhynchus moelleri) were isolated from garden soil, cow manure, lake water, and municipal sewage for use in experiments to demonstrate the biosynthesis of nitrosamines under conditions where only biological nitrosation could occur. M. parvispora and an unidentified bacterium converted trimethylamine to dimethylamine, and the bacterium (but not the fungus) formed dimethylnitrosamine in the presence of nitrite. Dimethylnitrosamine also appeared in cell suspension of E. coli and S. epidermidis and in hyphal mats of A. oryzae incubated with dimethylamine and nitrate. Suspensions of a number of microorganisms produced N-nitrosodiphenylamine from diphenylamine and diphenylamine and nitrite at pH 7.5, and soluble enzymes catalyzing the N-nitrosation of diphenylamine were obtained from two of these organisms. In the presence of these enzymes, several dialkylamines were converted to the corresponding N-nitroso compounds. (Little-Battelle)

UTILIZATION OF IRON GALLATE AND OTHER ORGANIC IRON COMPLEXES BY BACTERIA FROM WATER SUPPLIES,
Queensland Univ., Brisbane (Australia). Dept. of Microbiology.
I. C. Mac Rae, J. F. Edwards, and N. Davis.
Applied Microbiology, Vol 25, No 6, p 991-995, June 1973. 1 fig, 4 tab, 7 ref.

Descriptors: *Aquatic bacteria, *Microbial degradation, Water supply, Cultures, Biodegradation, Surface waters, Iron, Isolation, Organic compounds, Pseudomonas, Electron microscopy.
Identifiers: *Fate of pollutants, *Substrate utilization, *Organic iron compounds, Iron gallate, Organometallics, Ferric malonate, Ferric malate, Gallic acid, Ferric ammonium citrate, Alcaligenes, Acinetobacter, Vibrio, Moraxella, Culture media, Metal complexes.

The degradation of four soluble organic iron compounds by bacteria isolated from surface waters and the precipitation of iron from these complexes by the isolates was studied. All eight isolates brought about the precipitation of iron when grown on ferric ammonium citrate agar. Three isolates were able to degrade ferric malonate, and three others degraded ferric malate with iron precipitation. Only three isolates, two strains of Pseudomonas and one of Moraxella, were able to degrade gallic acid when this was supplied as the sole carbon source. One strain of Pseudomonas was found to be active in degrading ferric gallate. Electron microscopy of cells of this bacterium after growth in ferric gallate as the sole carbon source yielded results indicating uniform deposition of the iron on or in the bacterial cells. Seven of the isolates could degrade the iron gallate complex if supplied with additional carbon in the form of yeast extract. (Holoman-Battelle)

A COMPARISON OF THE DISTRIBUTION OF INTESTINAL BACTERIA IN BRITISH AND EAST AFRICAN WATER SOURCES,
Newcastle-upon-Tyne Univ. (England). Dept. of Civil Engineering.
L. M. Evison, and A. James.
Journal of Applied Bacteriology, Vol 36, No 1, p 109-118, March 1973. 7 tab, 23 ref.

Descriptors: *Enteric bacteria, *Pathogenic bacteria, *Ecological distribution, Water pollution, Bioindicators, Pollutant identification, Sewage effluents, Soils, Aerobic bacteria, E. Coli, Coliforms, Soil environment, Vegetation, Aquatic environment, Domestic wastes, Milk, Farm wastes, Sewage treatment, Africa, Water temperature.
Identifiers: *Kenya, *England, Culture media, Serotypes, Fecal streptococci, Lactobacillus spp, Salmonella spp, Enumeration, Klebsiella spp, Yogurt, Citrobacter freundii, Klebsiella aerogenes, Proteus spp, Survival.

Vrious workers have suggested that there are marked regional variations in the distribution of intestinal bacteria used as indicators of pollution in water supplies. Results are presented of investigations into the distribution of some intestinal indicators (coliforms, Escherichia coli, faecal streptococci and anaerobic lactobacilli) in water sources in the United Kingdom and in Kenya. The surveys showed that the differences in distribution were not significant except for some coliforms (Citrobacter and Klebsiella spp.), but that survival subsequent to excretion was affected by ambient temperature. (Holoman-Battelle)

A MEDIUM FOR COUNTING AQUATIC HETEROTROPHIC BACTERIA IN POLLUTED AND UNPOLLUTED WATERS,
University of Wales Inst. of Science and Tech., Cardiff.
D. G. Staples, and J. C. Fry.
Journal of Applied Bacteriology, Vol 36, No 1, p 179-181, March 1973. 1 tab, 12 ref.

Descriptors: *Aquatic bacteria, *Pollutant identification, *Sewage effluents, Water pollution, Natural streams, Cultures, Pollutants, Water sampling, Lakes, Rivers.
Identifiers: *Counting, *Heterotrophic bacteria, *Casein peptone starch medium, Culture media, Culturing techniques, River Kenson, River Ely, Nutrient agar, Plate counts, Sodium caseinate, Yeast extract, Iron peptone, River water agar, Sewage extract agar.

Casein-peptone-starch (CPS) medium was compared with 8 other media for counting heterotrophic bacteria in polluted and unpolluted surface waters. Samples were taken in sterile glass bottles, shaken 20 times, diluted with sterile river water, and appropriate dilutions were plated in triplicate by the spread plate techniques. The plates were incubated at 20 degrees for 10 days; colonies were counted on plates showing 30-300 colonies/plate. The results confirm that for clean and polluted rivers CPS is more suitable for counting freshwater bacteria than are the recommended media, including that of the American Public Health Association (1965). (Holoman-Battelle)
W74-00663

DEGRADATION OF CHLORINATED HYDROCARBONS BY CLOSTRIDIUM SP. ISOLATED FROM LINDANE-AMENDED, FLOODED SOIL,
Central Rice Research Inst., Cuttack (India).
N. Sethunathan, and T. Yoshida.
Plant and Soil, Vol 38, No 3, p 663-666, June 1973. 2 tab, 7 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Clostridium, *Soil bacteria, *Microbial degradation, Soil contamination, Insecticides, Anaerobic bacteria, Isolation, Biodegradation, Heptachlor, Radioactivity techniques, Anaerobic conditions.
Identifiers: *Lindane, *Flooded soil, Flooded conditions, Methoxychlor, Degradation products.

A Clostridium sp., isolated from flooded soil amended with lindane (gamma-BHC), decomposed methoxychlor, gamma-BHC and heptachlor in that order under anaerobic condition. During the bacterial degradation of ring-labelled C-14-gamma-BHC, there was a net loss of radioactivity from the reaction mixture. Release of C1402 during the degradation of C-14-gamma-BHC was negligible. Methane was not detected as an end product of gamma-BHC breakdown. (Holloman-Battelle)

INTERMEDIA ASPECTS OF AIR AND WATER POLLUTION CONTROL,
Stone (Ralph) and Co., Inc., Los Angeles, Calif.
R. Stone, and H. Smallwood.
Copy available from GPO Sup Doc as EP1.23 600-73-003, $3.25; microfiche from NTIS as PB-224 812, $1.45. Environmental Protection Agency, Socioeconomic Studies Series, Report EPA-600/5-73-003, August 1973. 356 p, 30 fig, 51 tab, 411 ref. EPA Program Element 1H1093, 68-01-0729.

Descriptors: *Water pollution, *Air pollution, Water pollution control, Water pollution sources, California, *Path of pollutants, Costs, Waste disposal, Waste water treatment, *Air-water interfaces.
Identifiers: *Intermedia pollution control, Intermedia transfer.

Current National intermedia pollutants (air, water, and residues) and strategies for their control were evaluated. Major intermedia pollutants in both air and water were identified. The principal sources of direct intermedia pollutant transfer were identified as incineration, wastewater processing, NO from water chlorination, sludge processing, release of radioactive gases (water-to-air): scrubbers, cleaning equipment, and regeneration of activated carbon (air-to-water). Indirect sources were identified as replacement of fossil fuel by nuclear energy, wastes generated by pollution-control equipment manufacture, and water recycling. Residue disposal problems were found to include landfill gas and leachate contamination, limited disposal sites, and increasing costs. Techniques of controlling intermedia pollutant transfer were found to include prevention, removal, recovery, and conversion; choice between these was found to depend on factors such as physical location, cost, and acceptability. Strategies for preventing intermedia transfer were found to include regulatory (restrictive and prohibitive), economic (incentives and sanctions), and educational. A mathematical model was developed and a gross California South Coast Basin Study conducted. (EPA)

RECONNAISSANCE ANALYSIS OF EFFECTS OF WASTE-WATER DISCHARGE ON THE SHALLOW GROUND-WATER FLOW SYSTEM, LOWER LAS VEGAS VALLEY, NEVADA,
Nevada Univ., Reno. Center for Water Resources Research.
J. A. Westphal, and W. E. Nork.
Project Report No. 19, April, 1972. 37 p, 23 fig, 3 tab, 18 ref. EPA Project 13030 EQB.

Descriptors: *Waste water (Pollution), *Dispersion, *Seepage, *Water pollution, *Effluent, Industrial wastes, Municipal wastes, Hydrology, *Nevada, Model studies.
Identifiers: Chemical responses, Digital simulation models, Analog simulation models, *Las Vegas Valley (Nev).

Analog and digital simulation techniques were used in this quantitative analysis of the effect of effluent disposal on the shallow ground-water flow system in the Henderson-East Las Vegas area of Las Vegas Valley. Modeling results indicate that approximately 3600 acres of the shallow flow system in the vicinity of, and down gradient from, surface disposal sites near Henderson may be influenced by surface spreading of industrial and municipal effluent. As much as 70% of this effluent may further percolate downward into underlying fine-grained sediments. Cessation of surface disposal of effluents, however, would result in an ultimate decrease in flow in Las Vegas Wash amounting to about 5 cubic feet per second. Water quality is extremely variable within the study area. In the immediate vicinity of BMI disposal sites, effluent percolating into the shallow sediments is not in chemical equilibrium with the geological materials. Except on the western periphery of the study area, analyses from shallow piezometers show that shallow ground water has been influenced by effluent disposal. Virtually all shallow ground water in the study area is ultimately influenced by disposal of either industrial or municipal effluent. (Hoffman-North Carolina)

PROJECT REPORT FOR VENTURA COUNTY PLANNING DEPARTMENT AND CASITAS MUNICIPAL WATER DISTRICT ON WATERSHED DEVELOPMENT IMPACT ON LAKE CASITAS.
Montgomery Research, Inc., Pasadena, Calif.

Summary Report. March, 1972. 20 p, 1 fig.

Descriptors: *California, *Planning, Land use, *Water quality, Environmental effects, *Reservoirs, *Eutrophication, Water pollution effects, Water supply, Urbanization, Multiple-purpose reservoirs, Zoning, Recreation demand, Monitoring, Waste water treatment.
Identifiers: *Lake Casitas (Calif), Ventura County (Calif.), Development alternatives, Reservoir degradation.

An investigation of potential lake water quality changes resulting from various hypothetical watershed development alternatives was conducted for Lake Casitas, a multiple-use reservoir constructed in 1959 by the Bureau of Reclamation and located in the southwest corner of Ventura County (Calif.). It supplies potable water to part of the county, provides recreational activity and scenic attraction, and assists in flood control. The approach involved (a) defining water quality objectives for the lake; (b) identifying sources of pollution from specific development alternatives; (c) evaluating effects of probable pollutants on water quality; and (d) evaluating pollution prevention methods. Conclusions based on existing data are that Lake Casitas would experience serious problems of eutrophication by 1990 if development occurs by any of the 8 identified alternatives: (1) regional park urbanization, (2) low density urbanization, (3) urbanization medium density, (4) regional park, (5) estate development, (6) dry farming, (7) irrigated farming, and (8) high density urbanization. Thus none of these developments should be implemented now. More restrictive forms of development are not ruled out. Numerous other findings relating to climatology, hydrology, geology and soils of the Casitas Basin, water quality and life expectancy of Lake Casitas, the use and condition of the watershed and lake are included. Additional data collection, monitoring and research on environmental quality, and investment in environmental control and protection measures are recommended. (Edwards-North Carolina)

EVAPORATION RATES OF LIQUID HYDROCARBON SPILLS ON LAND AND WATER,
Toronto Univ. (Ontario). Dept. of Chemical Engineering and Applied Chemistry.
D. Mackay, and R. S. Matsugu.
Canadian Journal of Chemical Engineering, Vol 51, No 4, p 434-439, August 1973. 6 fig, 20 ref.

Descriptors: *Oil spills, *Oily water, *Evaporation, *Mass transfer, *Heat transfer, *Mathematical studies, *Theoretical analysis, Equations, Wind velocity, Kinetics, Temperature, Correlation analysis, Turbulence, Turbulent boundary layers.
Identifiers: Schmidt Number, Cumene, Hydrocarbons.

Mass and heat-transfer processes occurring during the evaporation of petroleum oil spills are described. Equations are developed which permit predictions of liquid temperature and evaporation rates. Experimental determinations of evaporation rates for cumene, water, and gasoline were used to calculate the evaporative mass-transfer coefficients which were then correlated with wind speed, liquid pool size, and vapor-phase Schmidt-Number. Good agreement was found between experimental and computed cumene temperature and evaporation rates. The correlation was compared with that for flat-plate mass transfer and showed good agreement, suggesting that turbulent transfer occurs at a rate which is enhanced by the liquid surface roughness. The more complicated problem of estimating the evaporation rates of hydrocarbon mixtures, as in oil spills, is also broached. (Brown-IPC)

ENVIRONMENTAL HEALTH ANALYSIS.
Saginaw County Metropolitan Planning Commission, Mich.

January 1, 1972. 194 p, 24 fig, 12 tab. HUD CPA-MI-05-28-0317.

Descriptors: *Comprehensive planning, *Data collections, *Environmental sanitation, Air pollution, Water pollution, Michigan, Solid wastes, Regional development, Regional analysis, Administration.
Identifiers: *Saginaw County (Michigan).

The Saginaw County (Michigan) Metropolitan Planning Commission inventoried and analyzed existing environmental conditions of air and water pollution, solid waste management, land use, and housing conditions. Local, state, and federal actions toward these areas were studied and solutions and alternatives to correcting problems are suggested. The 1960 population of the study area was about 190,750 and is expected to grow to about 312,000 by 1990. Economic growth is expected to exceed the national average and to be primarily in the area of manufacturing specialization. As a result of the study, 16 specific recommendations were made. These include: (1) promotion of consolidation and designation of environmental responsibilities, (2) promotion of public information on environmental matters, (3) creation of an advisory council for environmental quality, (4) implementation of a country-wide coordinated environmental program, (5) creation of units larger than the county level for environmental problems including more than one county, (6) promotion of a State air pollution control program, and (7) promotion of greater State and Federal funding for environmental programs. (Poertner)

CARGO SPILL PROBABILITY ANALYSIS FOR THE DEEP WATER PORT PROJECT,
Woodward-Lundgren and Associates, Oakland, Calif.
K. Nair, H. C. Shah, W. S. Smith, and D. S. Shah.
Available from NTIS Springfield, Va. 22151 as AD-758 330 Price $3.00 printed copy; $1.45 microfiche. Contract report for Corps of Engineers, February 1973. 132 p, 11 fig, 18 tab, 79 ref, 4 append. DACW61-73-C-0349.

Descriptors: *Water pollution sources, *Oil spills, *Ships, Forecasting, Harbors, Transportation, Oil industry, Model studies, Probability, Methodology, Analytical techniques.
Identifiers: *Oil spill probability, Oil tankers, Tanker loading, Tanker unloading.

A probability model for predicting the occurrence of liquid cargo spills from tankers was developed and quantified using a Bayesian statistical approach. The probability model considers the size, cause, and location characteristics of cargo spills. The probabilistic values were derived from subjective information obtained from people knowledgeable of tanker operations and the associated likelihood of cargo spills. Subjective information was also obtained regarding the influence of supertankers on the future probability of cargo spills. The results have allowed definition of the probable size, cause, and location of cargo spills. If a cargo spill occurs, its most probable size is less than one long ton, its cause human error, and it occurred at dock during loading and unloading operations. The most probable location of the larger size spills is at entrances to ports and coastal areas. (Woodard-USGS)

REGIONAL POLLUTION STUDY: INVENTORY AND ANALYSIS.
Tulsa City-County Health Dept., Okla. Environmental Health Div.

Available from NTIS, Springfield, Va. 22151 as PB-218 076 - Price $5.25 printed copy; $1.45 microfiche. Indian Nations Council of Governments report, June 1972. 59 p, 1 fig, 11 tab, 5 ref. HUD CPA OK 0656 1012.

Descriptors: *Environmental control, *Water pollution control, *Air pollution, *Water pollution sources, Census, Computer programs, Systems analysis, Industrial wastes, Municipal wastes, Solid wastes, Treatment facilities, Data collections, Planning, Reviews.
Identifiers: *INCOG Environmental Pollution inventory.

This study is a preliminary inventory and analysis of the data contained in the Indian Nations Council of Governments (INCOG) Environmental Pollution File. A more complete analysis and use of the data in systems models will be made when the file is complete. It is intended that the file be a day-to-day operational tool for INCOG and other governmental departments for assessing the impact to the environment resulting from proposed community developments, both public and private. To be functional, the file must be updated continuously. A computer file is developed which contains information with respect to environmental protection by providing inventories of emissions to the ambient atmosphere, effluents to the streams, industrial wastewater sources, potable water sources and treatment plants, and solid waste collection systems and disposal sites. Summaries of the inventories and a preliminary analysis of the data are included. (Woodard-USGS)

FLUCTUATIONS IN NITRATE CONCENTRATIONS UTILIZED AS AN ASSESSMENT OF AGRICULTURAL CONTAMINATION TO AN AQUIFER OF A SEMIARID CLIMATIC REGION,
Eastern New Mexico Univ., Portales.
R. G. Taylor, and P. D. Bigbee.
Water Research, Vol 7, No 8, p 1155-1161, August 1973. 1 fig, 4 tab, 9 ref. OWRR A-034-NMEX (5).

Descriptors: *Nitrates, *Tracers, *Water pollution sources, *Fertilizers, *Farm wastes, Arid lands, *New Mexico, Return flow, Path of pollutants.

Nitrate concentrations were studied to demonstrate their applicability to examining agriculture practices which contaminate groundwater. Areas treated with nitrogenous fertilizers and subsequently irrigated have variations in nitrate content related directly to irrigation seasons. Agricultural industries with high animal densities and high water consumption for maintenance, were found to have high, but nonfluctuating nitrate concentrations. Areas with high animal density with low water usage for maintenance, areas with low animal density per land area, and agricultural practices for which little or no nitrogenous fertilizers were used demonstrated low aquifer nitrate concentrations regardless of water usage. EVERYTHING YOU ALWAYS WANTED TO KNOW ABOUT SULFATE-REDUCING BACTERIA (BUT WERE AFRAID TO ASK),
D. P. Johnston.
Baroid News Bulletin, Vol 24, No 1, p 15-19, 1973. 2 fig.

Descriptors: *Wells, Water wells, Oil wells, *Bacteria, Water analysis, *Bactericides, *Corrosion, Pitting, Chemical reactions, Hydrogen ion concentration, Sulfur bacteria.
*Sulfate-reducing bacteria, *Desulfovibris, Electrochemical corrosion.

Microorganisms cause problems throughout the petroleum industry. Several types of bacteria have been implicated; undoubtedly, the most troublesome organism is the sulfate-reducing organism, Desulfovibrio. Sulfate-reducing bacteria have a world-wide distribution, and exist in a variety of environments including drilling fluids, water-injection systems, gas storage reservoirs, and producing formations. These widespread organisms are physiologically unique in that they reduce sulfate to sulfide, the latter being well known for its role in the corrosion process. Laboratory personnel are working toward a better understanding of the science of petroleum microbiology. Sulfate-reducing bacteria have been studied in great detail, and chemicals to control this troublesome organism are marketed under the SURFLO trademark. (Campbell-NWWA)

WELL CONSTRUCTION HELPS DETERMINE WATER QUALITY,
Agricultural Research Service, Beltsville, Md. Farmstead Water Systems Research.
E. E. Jones, Jr.
Journal of Environmental Health, Vol 35, No 5, p 443-450, March-April, 1973. 15 fig, 2 tab, 3 ref.

Descriptors: *Design, Water Supply, *Water pollution, Contamination, *Groundwater, Agricultural chemicals, Path of Pollutants, *Pesticide residues, Coliforms, Disperson, Water quality.
Identifiers: Agricultural research service, *Locating sanitary defects.

Information gained on the relationship between well construction and water quality in trying to determine the paths of entrance into, and the means of excluding, pesticides from wells is presented. Three farmstead water supply wells characterized by an obvious lack of adequate sanitary protection are described. When wells of this nature are identified, reconstruction or abandonment and proper closure is emphasized. Factors contributing to non-uniform contamination of a well are identified. Deterioration of ground water quality with respect to the entrance of surface water into a well is discussed. A need for study of wells apparently having adequate sanitary protection but showing signs of surface contamination, rapid changes in water quality with rainfall, bacterial contamination, turbidity, and/or the presence of pesticides is stressed. (Campbell-NWWA)

OPTIMIZATION OF SURFACE-WATER QUALITY: A PROPOSAL FOR SOLVING A FUTURE PROBLEM (IN GERMAN),
Frankfurt Univ. (West Germany). Hygiene-Institut.
R. H. W. Schubert.
Zentralbl Bakteriol Parasitenkd Infektionskr Hgy Erste Abt Orig Reihe B Hyg Praev Med, Vol 155, No 3, p 248-255, 1971, English summary.
Identifiers: Flow, *Optimization, Pollution, River, *Sewage disposal, Surface waters, *Waste transport, Water quality, *Regional analysis.

It is not possible to solve the current environmental problems with conventional methods; they must be treated regionwise, using a model to simulate the conditions present. Based on functions which flowing waters will be having in the Central European civilization and economy, quality of the water and sewage disposal are discussed. Shortcomings of the current system have led to inadequate economy of flowing waters. Classification of waste products, and regulations for the discharge of sewage into running waters are necessary to use flowing waters optimally for waste transport and to provide for sufficient stretches necessary for self purification of the water. Toxic substances and compounds which do not readily disintegrate may be discharged into flowing water only at moderate amounts which do not impair self purification. Medium and readily disintegratable substances should be discharged only at amounts which do not exceed the maximum permissible load on the river water. The principles of a mathematical model are explained, whereby a river is simulated from its source to its mouth, which aids optimization waste transport, self purification, and water quality.--Copyright 1973, Biological Abstracts, Inc.

Cah O R S T O M (Off Rech Sci Tech Outre-Mer) Ser Oceanogr, Vol 10, No 1, p 75-97, Illus, 1972, English summary.
Identifiers: Bays, Biochemical studies, *Circulation (Estuarine), *Madagascar (Ampasindava Bay), *Oxygen, *Salinity, Estuarine environment, Path of pollutants.

After a 1 yr survey, it appears that the main dynamic feature of the Ampasindava Bay, Madagascar is the estuarine circulation through the rainy season, resulting in the production of bottom water with low O2 and high nutrient salt values. During the dry season, as the estuarine circulation weakens greatly, the salinity becomes homogenous and the nutrients almost disappear. Two tentative methods for transport estimation are proposed and discussed.--Copyright 1973, Biological Abstracts, Inc.

STREAM AND LAKEFRONT FIELD INVENTORY, VOLUME I - SUMMARY.
Lorain County Regional Planning Commission, Elyria, Ohio.

Lorain County Water Pollution Study Report No. 12. 1967. 227 p, 9 fig, 20 plates, 169 tab, 3 ref, 6 append.

Descriptors: *Water quality, *Water pollution sources, *Data collections, *Ohio, Odor, Color, Water sampling, On-site investigations, On-site data collections.
Identifiers: *Lorain County (Ohio), Lake Erie, Black River.

A graphic presentation is provided of water quality data collected in 1966-1967 for Lorain County, Ohio. The field inventory was designed to determine the general nature of the water pollution problem in the county and was particularly interested in the location of polluted waters, the origin of the pollutants and the estimated discharge. The emphasis was on the aethetic nature of the pollution rather than on laboratory analyses and physical/chemical properties. Thus, one output of the inventory is the identification of points where water samples should be taken and tested and specific problem locations. Most of these points are concentrated on the Black River and the Lake Erie waterfront. Almost 2,000 wastewater outlets and/or specific wastes were identified. The largest sources of wastewater were cooling water discharges from electric power and steel industries. Tables of summary data for specific locations throughout the county are included. Pollution is worst on the main stem of the Black River and the Lake Erie waterfront since most industrial and municipal discharges are concentrated in these areas. (Elfers-North Carolina)

SEEPAGE FLOWS--FIELD DATA MEASUREMENTS FOR EVALUATION OF POTENTIAL CONTRIBUTION OF FERTILIZERS TO GROUNDWATER POLLUTION,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Civil and Environmental Engineering.
L. Michna, and E. L. Bourodimos.
Soil Science, Vol 115, No 6, p 401-408, June 1973. 5 fig, 12 ref. OWRR A-027-NJ (2).

Descriptors: *Leaching, *Path of pollutants, *Fertilizers, Nitrates, *New Jersey, Groundwater movement, Data collections, Permeability, Isotropy, *Seepage.

Losses from nitrogen fertilizers into natural waters are largely as nitrates and can occur both through leaching and surface runoff. Several approaches are currently being used to attack this problem. All have the advantage of obtaining data under actual field conditions. Field data taken at the Adelphia Experimental Station of Rutgers University include soil permeability, groundwater hydraulic gradients, and seepage velocities. The flow field characteristics are determined by measuring groundwater table fluctuations and by evaluating the coefficient of permeability. Groundwater fluctuations are measured through a continuous monitoring and determination of the piezometric grade line. The coefficient of permeability is measured by means of tube and auger hole methods. The coefficient of permeability for this particular soil condition (mixture of fine sand and silt) practically does not change within the observed depth of groundwater table fluctuations. A pumping test is underway for verification of the coefficient of permeability by direct evaluation of the flow rate (and thereby discharge velocity), the hydraulic gradient, and pollutant concentration measurements. Descriptors: *Water pollution, *Chemical wastes, *Warning systems, Hazards, Safety, Toxicity, Water pollution control, Discharge (Water).
Identifiers: Emergency response, Hazardous chemicals, Accidental chemical releases.

A Chemical Hazards Response Information System (CHRIS) is designed to satisfy the information needs of Coast Guard field personnel when responding to emergencies involving the accidental release of hazardous chemicals into water. It will also serve nonemergency needs as they apply to the development of improved safety in the water transport of hazardous chemicals. CHRIS consists of the organization and facilities necessary for the system development and operation, and five hard-copy reference guides (or manuals) containing chemical-specific data, local information on vulnerable life forms and property and response resources, hazard assessment procedures, and response methods. These data bases are augmented with a computerized hazard assessment system. (Woodard-USGS)

5C. Effects of Pollution

A EUTROPHICATION MODEL OF THE WHITE RIVER BASIN ABOVE BEAVER RESERVOIR IN NORTHWEST ARKANSAS,
Arkansas Univ., Fayetteville. Dept. of Civil Engineering.
R. A. Gearheart.
Available from the National Technical Information Service as PB-224 811, $7.50 in paper copy, $1.45 in microfiche. Arkansas Water Resources Research Center, Fayetteville Publication No. 15, 1973. 100 p, 6 fig, 23 tab, 47 ref, 3 append. OWRR B-012-ARK (4). 14-01-0001-1877.

Descriptors: *Eutrophication, Nutrients, *Nitrogen, *Posphorus, Urban runoff, Growth rates, *Arkansas, Model studies, Agricultural runoff.
Identifiers: *Beaver Reservoir (Ark), *White River basin (Ark), *Algal growth rates, Nutrient budget.

The purpose of this investigation was threefold: (1) to determine the rate of nutrient accumulation in Beaver Reservoir, (2) to develop a eutrophication model to predict future eutrophication levels, and (3) to identify and isolate the major nutrient contributors of Beaver Reservoir. Stream and reservoir sampling networks were established and monitored for the various forms of soluble nitrogen and phosphorus. A nutrient budget for Beaver Reservoir was determined, and the rate of nutrient accumulation calculated from the nutrient inflow and outflow rates. The major nutrient contributors were based on the various types of runoff (i.e., agricultural and urban runoff occurring around the reservoir). These were ranked according to the amount contributed to total nutrient inflow. Overall algal growth rates for the six Beaver Reservoir sampling stations were developed from a reservoir model equation. Various parameters which influence algal growth were regressed to establish an overall rate equation. Other prediction equations were established for regression for nutrient loadings from major nutrient contributors. (Babcock-Arkansas)

STUDIES ON BRACKISH WATER PHYTOPLANKTON,
North Carolina Univ., Chapel Hill. Dept. of Botany.
P. H. Campbell.
Available from NTIS, Springfield, Va., 22151 as COM73-10672 Price $6.00 printed copy; $1.45 microfiche. North Carolina University Sea Grant Publication UNC-SG-73-07, March 1973. 406 p.

Descriptors: *Phytoplankton, *Systematics, *Estuaries, *Ponds, *Water pollution effects, Aquatic life, Environmental effects, Salinity, Sewage effluents, Fish, Ecosystems, Ecosystems, Ecology, Growth rates, Nutrients, Diatoms, Water temperature, Dissolved oxygen, Light penetration, Hydrogen ion concentration, Classification.
Identifiers: *Taxonomy.

This study on brackish water phytoplankton contains 2 reports. In the first report the phytoplankton of Gales Creek, a small shallow coastal plain estuary near Morehead City, N. C., was studied for over a year. Special emphasis was placed on determining the species composition and distribution patterns of the phytoflagellates and in measuring environmental factors which may influence the presence and distribution of these species. In the second report, polluted brackish ponds were found to support a high level of primary productivity with sewage plant effluent, but whether this productivity can be converted to a dependable harvest remains to be seen. So far, the production of blue crabs in the ponds has been too low for commercial interest, the palaemonetes shrimp that grew well are not valued as human food, and edible fish did not grow. The system was strongly taxed by very dense phytoplankton concentrations, primarily of a single species. (See W74-00590 and W74-00591) (Woodard-USGS)
W74-00589

THE PHYTOPLANKTON OF GALES CREEK WITH EMPHASIS ON THE TAXONOMY AND ECOLOGY OF ESTUARINE PHYTOFLAGELLATES--PART 1 OF STUDIES ON BRACKISH WATER PHYTOPLANKTON,
North Carolina Univ., Chapel Hill. Dept. of Botany.
P. H. Campbell.
In: North Carolina University Sea Grant Publication UNC- SG-73-07, p 1-359, March 1973. 24 fig, 33 plates, 11 tab, 279 ref.

Descriptors: *Phytoplankton, *Systematics, *Estuaries, *North Carolina, Classification, Aquatic life, Diatoms, Environmental effects, Sampling, Water temperature, Salinity, Dissolved oxygen, Light penetration, Hydrogen ion -concentration, Nutrients.
Identifiers: *Phytoflagellates, *Taxonomy, *Gales Creek (N.C.).

The phytoplankton of Gales Creek, a small shallow coastal plain estuary near Morehead City, N. C., was studied for over a year. Special emphasis was placed on determining the species composition and distribution patterns of the phytoflagellates and in measuring environmental factors which may influence the presence and distribution of these species. A total of 187 diatom taxa were identified. Diatoms exhibited a classic bimodal pattern of seasonal abundance with maxima in spring and autumn. A total of 152 species of phytoflagellates in 49 genera and 9 classes of algae are described and figured, including 32 species, 4 varieties and 6 combinations new to science. Phytoflagellates dominated the phytoplankton throughout most of the year. The mean yearly standing crop for phytoflagellates was only 500,000 cells/liter. Low densities are attributed to low nitrate concentrations and high flushing rate of the estuary. Phytoflagellate seasonal distribution was bimodalwith moderate densities in spring and maximum cell concentrations in late summer. A majority of the dominant phytoflagellates were eurythermal and euryhaline species. (See also W74-00589) (Woodard-USGS)
W74-00590

PHYTOPLANKTON POPULATIONS IN BRACKISH WATER PONDS, A REVISED REPORT--PART II OF STUDIES ON BRACKISH WATER PHYTOPLANKTON,
North Carolina Univ., Chapel Hill. Dept. of Botany.
P. H. Campbell.
In: North Carolina University Sea Grant Publication UNC-SG-73-07, p 361-406, March 1973. 4 fig, 3 plate, 3 tab, 39 ref.

Descriptors: *Water pollution effects, *Brackish water, *Ponds, *Sewage effluents, *Aquatic life, Environmental effects, Ecosystems, Ecology, Fish, Phytoplankton, Salinity, Systematics, Classification, Growth rates.
Identifiers: *Taxonomy.

Polluted brackish ponds were found to support a high level of primary productivity with sewage plant effluent, but whether this productivity can be converted to a dependable harvest remains to be seen. So far, the production of blue crabs in the ponds has been too low for commercial interest, the palaemonetes shrimp that grew well are not valued as human food, the edible fish did not grow. The system was strongly taxed by very dense phytoplankton concentrations, primarily of a single species, so perhaps better results could be achieved by holdings these densities below the 100,000 cells/ml concentrations where species diversity can still be maintained, possibly by increasing the flushing rate of the ponds from their normal one to two times per month. The ponds support a wide diversity of species representing 10 classes of phytoplankton. The 155 taxa of phytoplankton observed in the 16-month study included 97 diatoms, 16 dinoflagellates, 9 cryptomonads, 8 prasinophytes, 6 xanthophytes, 5 chrysophytes, 5 green algae, 4 euglenoids, 3 haptophytes, and 2 blue-green algae. A number of these organisms did not readily fit existing descriptions and are probably new taxa merely awaiting further observation and study. (See also W74-00589) (Woodard-USGS)

SURVIVAL OF VIBRIO PARAHAEMOLYTICUS IN OYSTER SHELLSTOCK AT TWO DIFFERENT STORAGE TEMPERATURES,
Maryland Dept. of Health and Mental Hygiene, Baltimore. Labs. and Research Administration.
W. G. Johnson, Jr., A. C. Salinger, and W. C. King.
Applied Microbiology, Vol 26, No 1, p 122-123, July 1973. 2 tab, 8 ref.

Descriptors: *Pathogenic bacteria, *Enteric bacteria, *Storage, *Temperature, Marine bacteria, Isolation, Oysters, Pollutant identification, Anaerobic bacteria, Shellfish, Virginia, Maryland.
Identifiers: Survival, *Oyster shellstock, *Vibrio parahaemolyticus, Culture media, Fisher Bay, *Chincoteague Bay.

The presence and survival of V. parahaemolyticus were determined in oyster shellstock taken from an outlet, Fishing Bay, of the Chesapeake Bay and transported to a floating area in the Chincoteague Bay, an inlet of the Atlantic Ocean. Some of the samples collected at intervals from Chincoteague Bay were examined immediately while others were stored at 35C and 4C. V. parahaemolyticus was isolated by culturing equal volumes of oyster meats and liquor from 12 organisms in Trypticase soy broth. After 24 h incubation at 35C samples from each dilution were streaked on thiosulfate-citrate-bile salt-sucrose agar. These were then incumbated at 35C for 24 h. Vibrio parahaemolyticus was found to be present, to survive storage for at

least 3 weeks at 4C, and to multiply after being held for 2 to 3 days at 35C. (Holoman-Battelle)

EFFECTS OF CALCIUM AND MAGNESIUM IONS AND HOST VIABILITY ON GROWTH OF BDELLOVIBRIOS,
California Univ., Davis. Dept. of Bacteriology.
J. C -C.Huang, and M. P. Starr.
Antonie van Leeuwenhoek, Vol 39, No 1, p 151-167, 1973. 5 tab, 31 ref.

Descriptors: *Cultures, *Calcium, *Magnesium, *Growth rates, *Hosts, Bioassay, Nutrients, Viability, Parasitism.
Identifiers: *Bdellovibrio, Culture media, Amino sugars, Sugars, Bacterial physiology, Spirillum serpens.

Bdellovibrio spp strains 6-5-S, 100, 109 and A3.12 multiply in the presence of viable but non-proliferating or heat-killed cells of Spirillum serpens strain VHL suspended in buffers supplemented with Ca (2 plus) and or Mg (2 plus). Ca (2 plus) and Mg (2 plus) independently stimulated the growth of bdellovibrios: additive effects were noted. Multiplication of Bdellovibrio in the presence of Ca (2 plus) and Mg (2 plus) was associated with the release into the culture supernatant solution of UV-absorbing materials and of amino sugars. The growth rate of Bdellovibrio strain 6-5-S in suspensions of heat-killed host cells was lower than in living but non-proliferating host cells. All Bdellovibrio spp strains tested required added Ca (2 plus) for growth in cell suspensions of homologous or heterologous host bacteria which have been grown in minimal medium. Bdellovibrio sp strain 109 (Jerusalem) was capable of growing in the presence of the low level of Ca (2 plus) bound in situ to the cells of its host, E. coli B, when the host cells had been cultivated in a complex medium but not when the host cells had been grown in a Ca (2 plus)-depleted minimal medium. Addition of ethylenediaminetetraacetic acid prevented Bdellovibrio growth, which was restored by addition of Ca (2 plus) and Mg (2 plus). The cations Ca (2 plus) and Mg (2 plus) are essential for activity of bacteriolytic and other enzymes and they might also directly affect Bdellovibrio growth rather than only indirectly by affecting attachment to the host cell, maintaining integrity of the host spheroplasts, and increasing the burst size. (Little-Battelle)

THE INFLUENCE OF ENVIRONMENTAL FACTORS ON THE DISTRIBUTION OF FRESHWATER ALGAE: AN EXPERIMENTAL STUDY. II. THE ROLE OF PH AND THE CARBON DIOXIDE-BICARBONATE SYSTEM,
Michigan State Univ., East Lansing. Dept. of Botany.
B. Moss.
Journal of Ecology, Vol 61, No 1, p 157-177, March 1973. 7 fig, 5 tab, 50 ref.

Descriptors: *Environmental effects, *Aquatic algae, *Ecological distribution, *Laboratory tests, *Growth rates, *Water properties, Carbon dioxide, Bicarbonates, Hydrogen ion concentration, Plant growth, Trophic level, Iron, Trace elements, Water quality, Cyanophyta, Chlorophyta, Euglenophyta, Chrysophyta, Pyrrophyta, Diatoms, Dinoflagellates, Incubation, Cultures, Oligotrophy, Eutrophication, Biomass, Carbonates, Sodium chloride, Water pollution effects, Chelation, Hardness (Water), Plant physiology, Bioassay, Limiting factors.
Identifiers: Data interpretation, EDTA, Algal physiology, Chlamydomonas reinhardii, Euglena gracilis, Trachelomonas grandis, Flagellates, Desmids, Cryptomonads, Sodium bicarbonate, Gloeocapsa, Gloeotrichia, Tolypothrix distorta, Cryptomonas ovata, Eunotia, Nitzschia palea, Synura petersenii, Peridinium cinctum, Closterium acerosum, Cosmarium botrytis, Desmidium swartzii, Eudorina californica, Gonatozygon monotaenium, Haematococcus droebakensis, Mesotaenium kramstai, Micrasterias spp, Oedogonium cardiaceum, Pandorina morum, Pediasstrum spp, Pleurotaenium trabecula, Roya anglica, Scenedesmus quadricauda, Ulothrix fimbriata, Volvox aureus, Zygnema spp.

Experiments have been conducted to determine the effects of the pH-CO2-bicarbonate system on the growth of algal species of the Chlorophyta, Chrysophyta, Pyrrophyta, Euglenophyta, Cyanophyta, and Cryptophyta (Cryptomonads). Series of media with different pH values were made by the addition of dilute HCl or sodium bicarbonate to standard media. Growth was measured as an increase in cell or coenobium numbers over a suitable period of the logarithmic phase. At least three, and sometimes as many as ten, counts were made at suitable intervals for the plotting of logarithmic growth curves. Carbonate and bicarbonate levels were determined on samples of media, prepared, autoclaved, and allowed to stand exactly as those used in the experiments. Oligotrophic species of algae would not grow at pH values above 8.6-8.85, while eutrophic ones grew at pH values above 9, and at considerably higher bicarbonate levels than did the former. The results are interpreted in terms of the available free CO2 at various combinations of pH and bicarbonate. Oligotrophic species are probaby confined to free CO2 as an inorganic carbon source for photosynthesis, and may be unable to absorb it below certain concentrations (at least 0.011 mM). Eutrophic species may either use bicarbonate directly or may be able to use free CO2 at very low concentrations. Field observations support the hypothesis that the availability of free CO2 prevents growth of oligotrophic species in hard waters. THE INFLUENCE OF ENVIRONMENTAL FACTORS ON THE DISTRIBUTION OF FRESHWATER ALGAE: AN EXPERIMENTAL STUDY. III. EFFECTS OF TEMPERATURE, VITAMIN REQUIREMENTS AND INORGANIC NITROGEN COMPOUNDS ON GROWTH,
Michigan State Univ., East Lansing. Dept. of Botany.
B. Moss.
The Journal of Ecology, Vol 61, No 1, p 179-192, March 1973. 6 fig, 3 tab, 48 ref.

Descriptors: *Growth rates, *Environmental effects, *Nutrient requirements, *Water temperature, *Aquatic algae, *Laboratory tests, *Ecological distribution, Plant growth, Biomass, Nitrogen, Vitamins, Chlorphyta, Trophic level, Euglenophyta, Water quality, Nutrients, Nitrates, Oligotrophy, Eutrophication, Cultures, Bioassay, Plant physiology, Limiting factors.
Identifiers: Algal physiology, Vitamin B12, Biotin, Thiamine, Desmids, Micrasterias americana, Pleurotaenium trabecula, Cosmarium, Gonatozygon Monotaenium, Roya anglica, Desmidium swartzii, Pandorina morum, Cosmarium botrytis, Closterium acerosum, Volvox aureus, Eudorina californica, Haematococcus droebakensis, Mesotaenium krastai, Scenedesmus quadricauda, Pediastrum duplex, Ammonium, Gloeocapsa, Gloeotrichia, Tolypothrix distorta var. symplocides, Culture media, Euglena gracilis, Chlamydomonas reinhardii.

Experiments to determine the growth rate of 15 species of algae at temperatures between 4 and 36 C were carried out in constant temperature water baths fitted with heater and refrigeration units. The experimental flasks were shaken at 40 strokes/min on a submerged reciprocating tray. Size of the organisms was measured as cellular organic matter capable of oxidation by hot acid potassium dichromate, using exponential phase, unsynchronized cultures grown at or near the optimum temperature for growth. Vitamin requirements (vitamin B12, biotin, thiamineWERE STUDIED IN SETS OF VARIOUSLY MODIFIED STANDARD MEDIA. The maximum growth rates of oligotrophic species tended to be smaller than those of eutrophic species. Temperature obtima for growth under the conditions used did not differ between the two groups. Possible adaptive advantages of low growth rates in infertile waters are duscussed in relation to theoretical generalizations on the maturity of ecosystems. Some members of both groups required vitamin B12 for growth, and most species tested could use either nitrate or ammonium as a nitrogen source. (See also W74-00639) (Holoman-Battelle)
W74-00640

THE INFLUENCE OF ENVIRONMENTAL FACTORS ON THE DISTRIBUTION OF FRESHWATER ALGAE: AN EXPERIMENTAL STUDY. IV. GROWTH OF TEST SPECIES IN NATURAL LAKE WATERS, AND CONCLUSION,
Michigan State Univ., East Lansing. Dept. of Botany.
B. Moss.
Journal of Ecology, Vol 61, No 1, p 193-211, March 1973. 12 fig, 1 tab, 42 ref.

Descriptors: *Bioassay, *Environmental effects, *Aquatic algae, *Lakes, Limiting factors, *Ecological distribution, *Laboratory tests, Trophic level, Chlorophyta, Nutrient requirements, *Michigan, Hardness (Water), Hydrogen ion concentration, Oligotrophy, Eutrophication, Phosphorus, Scenedesmus, Chlorella, Diatoms, Chrysophyta, Plant physiology, Carbon dioxide, Cultures.
Identifiers: Natural waters, Algal physiology, Pandorina morum, Cosmarium botrytis, Desmids, Micrasterias americana, Pleurotaenium trabecula, Nitzschia palea, Achnanthes, Fragilaria, Bear lake, Duck Lake, Gull Lake, Lawrence Lake, Wintergreen Lake, Culture media.

Growth of two eitrophic species, Pandorina morum and Cosmarium botrytis, and of two oligotrophic species Micrasterias americana and Pleurotaenium trabecula, was measured in filtered natural lake waters of varied chemical composition. Such experiments were carried out to test the following assertions: (1) The reduction of the free CO2 level, brought about by experimental increase in pH, should decrease growth of oligotrophic species in soft waters. The reduction of pH in hard waters should permit increased growth of oligotrophic species. (2) In the presence of adequate phosphate, nitrate and other potentially

limiting nutrients, eutrophic species should be able to grow in both soft and hard waters. In all waters but those of a heavily fertilized lake, addition of a mixture of potentially limiting nutrients gave much greater growth than that obtained in controls. The oligotrophic species grew better in hard waters if the pH was reduced, and less well in soft waters when the pH was increased. The results are in accord with predictions made from laboratory experiments with defined culture media. Bio-assays, employing the indigenous flora as test organisms, were carried out for limiting nutrients in the waters used. In soft waters both nitrogen and phosphorus were found to be limiting to algal growth in general, while phosphorus along appeared limiting in two hard-water lakes. The interpretation of bioassays is discussed. A general summary of the conclusions of Parts I-IV is presented as an overall hypothesis. (See also W74-00639) (Holoman-Battelle)

THE STANDING CROP AND PRIMARY PRODUCTIVITY OF THE PHYTOPLANKTON OF ABBOT'S POND, NORTH SOMERSET,
Bristol Univ. (England). Dept. of Botany.
M. Hickman.
Journal of Ecology, Vol 61, No 1, p 269-287, March 1973. 10 fig, 3 tab, 45 ref.

Descriptors: *Primary productivity, *Standing crops, *Biomass, *Phytoplankton, *Ecological distribution, Limiting factors, Aquatic algae, On-site tests, Chrysophyta, Dominant organisms, Pyrrophyta, Chlorophyta, Depth, Plant populations, Light intensity, Photosynethesis, Radioactivity techniques, On-site data collections, Diatoms, Water quality, Water properties, Seasonal, Temporal distribution, Spatial distribution.
Identifiers: *Abbot's Pond (U.K.), Photosynthetic index, Cryptomonads, Chlorophyll a, Enumeration, Cell volume, C-14, Asterionella formosa, Peridinium aciculiferum, Wolosyznskia, Scenedesmus granulatus, Pandorina morum, Chlamydomonas monadina, Synura, Chrysococcus diaphanus, Vertical distribution, Synedra acus var. angustissima, Diatoma elongatum, Trachelomonas volvocina, Stephanodiscus rotula, Rhodomonas minuta var. nannoplanktica, Cryptomonas erosa.

The standing crops and primary productivity of the phytoplankton of a small, eutrophic body of water, Abbot's Pond, have been studied over a 24-month period. Water samples collected with a closing water sampler at 0.5-m intervals were kept in subdued light for standing crop and primary productivity measurements. Standing crops were determined by cell counts, and by measuring cell volumes, and the chlorophyll a content of the phytoplankton. Primary productivity was measured using the C-14 technique. The total alkalinity and pH of each sample were measured so that the total dissolved carbon dioxide (mg/l) in each water sample could be calculated. In general, both standing crops and primary productivity were large, and decreased with increasing depth and hence decreasing light intensity. However, exceptions to this general trend did occur. Results are considered with reference to the species of phytoplankters. Relationships of different measures of standing crop are discussed. Also, relationships between productivity and chlorophyll a content, and between productivity and light intensity, were investigated, as was the photosynthetic index. The mean yearly primary productivity of the phytoplankton was approximately twelve times that of the epipelon on an areal basis. The most important factor limiting productivity appeared to be light. NEGATIVE CHEMOTAXIS OF MARINE BACTERIA TO TOXIC CHEMICALS,
Harvard Univ., Cambridge, Mass. Div. of Engineering and Applied Physics.
L. Y. Young, and R. Mitchell.
Applied Microbiology, Vol 25, No 6, p 972-975, June 1973. 2 fig, 1 tab, 10 ref.

Descriptors: *Marine bacteria, *Organic compounds, *Inorganic compounds, Heavy metals, Toxicity, Chemicals, Viability, Copper sulfate.
Identifiers: *Chemotaxis, *Heterotrophic bacteria, *Pseudomonads, Hydrocarbons, Chloroform, Ethanol, Toluene, Organic solvents, Benzene, Lead nitrate.

The pattern and extent of negative chemotactic behavior are described for four motile marine bacteria. Sublethal concentrations of toxic organic (0.001-5 percent, wt/vol) and inorganic (0.0001-0.5 percent, wt/vol) compounds were used as stimuli. The vaiability of the organisms over the range of concentrations used was determined by incubating a known concentrations of cells in each concentration of chemical for 10 min. Numbers were determined by serial dilution in artificial seawater and plating on seawater-nutrient agar. The positive chemotactic responses were reversed by the addition of the sublethal concentrations of the toxic chemical. The negative chemotactic effect was observed with a wide range of toxicants including heavy metals and hydrocarbons. This phenomenon may be utilized to develop new approaches for control of marine fouling. (Holoman-Battelle)

RESPONSES OF A MIXED PHYTOPLANKTON POPULATION TO NUTRIENT ENRICHMENTS OF AMMONIA AND PHOSPHATE, AND SOME ASSOCIATED ECOLOGICAL IMPLICATIONS,
Freshwater Biological Association, Ambleside (England).
A. B. Viner.
Proceedings of the Royal Society of London, Series B, Vol 183, No 1073, p 351-370, July 3, 1973. 7 fig, 3 tab, 37 ref.

Descriptors: *Cultures, Limiting factors, *Respiration, *Photosynthesis, *Phytoplankton, *Absorption, Nitrogen, Phosphorus, Dissolved oxygen, Carbon, Carbon dioxide, Bioassay, Laboratory studies, On-site tests, Nutrients, Phosphates, Ammonia, Light intensity, Algae, Diatoms, Water quality, Population, Ecology.
Identifiers: *Enrichment, Microcystis aeruginosa, Chlorophyll a, Nitzschia fonticola, Microcystis flos-aquae, Lake George, Uganda.

To test the hypothesis that nitrogen and phosphorus were major elements limiting phytoplankton growth in Lake George (W. Uganda), experiments were carried out in which ammonia-nitrogen and phosphate-phosphorus were added to freshly sampled mixed populations of phytoplankton. Natural, mixed plankton were cultured in conical flasks immersed in a water bath and illuminated. Experiments were also conducted in which culture bottles were suspended in the lake. Chlorophyll a was determined by methanol extraction, carbon by conversion to CO_2, and oxygen by the Winkler procedure. Nitrogen starvation was inferred from the very high uptake rate of ammonia in the light and also substantial uptake in the dark, implying a reserve of photosynthate unused for growth purposes. Phosphate enhanced these responses. The addition of both ammonia and phosphate increased the respiratory rate of the algae, but not the photosynthetic rate until after a period when growth of the phytoplankton must have occurred. There is some evidence that such growth did not occur until after the second day of experimentation and the responses before this time reflected the demands of the algae in the lake at the time of sampling. Repeated experiments over a period of 6 months showed similar patterns of response to enrichment although quantitatively they were different. A number of ecological implications of the results are discussed. (Holoman-Battelle)

ALGAE ABSTRACTS, A GUIDE TO THE LITERATURE, VOLUME 1 TO 1969; VOLUME 2, 1970-1972.
Office of Water Resources Research, Washington, D.C. Water Resources Scientific Information Center.

IFI/Plenum: New York 1973. Vol I, 585 p; Vol II, 693 p. $65.00 per set.

Descriptors: *Bibliographies, *Algae, *Abstracts, *Eutrophication, Algal control, Analytical techniques, Bioassay, Biodegradation, Cyanophyta, Nutrients, Lakes, Nitrogen, Phosphorus, Phytoplankton, Sewage, Water pollution effects, Waste water treatment, Documentation, Indexing.

This is the first in a series of bibliographies on water resources and pollution published by IFI/Plenum Data Corporation in cooperation with the Water Resources Scientific Information Center (WRSIC). It is produced wholly from the information base comprising material abstracted and indexed for Selected Water Resources Abstracts. The bibliography is divided into volumes according to the publication dates of the source documents. Volume 1 contains 569 abstracts covering publication dates up to and including 1969; Volume 2 contains 730 abstracts covering the years 1970 to 1972. The material included in this bibliography represents computer selections based on the presence of a form of the word 'alga' somewhere in the referenced citation. Substantively, the material typifies WRSIC's 'centers of competence' approach to information support of the Office of Water Resources Research (OWRR) of the Department of the Interior. Most of the references in this bibliography are the work of the center of competence on eutrophication at the University of Wisconsin.
W74-00704

EFFECTS OF ELEMENTAL PHOSPHORUS ON MARINE LIFE.
Fisheries Research Board of Canada, Halifax (Nova Scotia).

Circular No. 2, November 1972. 313 p. 108 fig, 52 tab, 205 ref, 1 append.

Descriptors: *Phosphorus, *Marine animals, *Marine plants, *Canada, *Water pollution effects, Water pollution control, Mortality, Marine fish, Fisheries, Herrings, Estuaries, Invertebrates,

Toxicity, Salmonids, Lobsters, Oxidation, Water pollution sources, Bottom sediments, Benthos, Animal pathology, Gas chromatography, Fluorides, Soils, Phosphorus compounds, Analytical techniques, Tidal effects, Tracers, Measurement, Bioassay, Dredging, Sculpins, Crabs, Mussels, Monitoring.
Identifiers: *Pacentia Bay (Newfoundland), Elemental phosphorus, 'Red' herring, Cod.

Dead and dying fish were found in the winter and spring of 1969 in Placentia Bay, Newfoundland, coinciding with the opening of a phosphorus plant. While circumstantial evidence implicated plant effluents, direct evidence was lacking. A major coordinated investigation indicated that phosphorus quantities in the effluent were greater than required to kill fish, the most susceptible of which were herring, exhibiting 'red' symptoms. Phosphorus accumulation in the bottom sediments near the effluent outfall was also toxic to fish. The behavior of elemental phosphorus as a pollutant was studied in its decomposition in water, the capacity of the estuary to accept pollutants, and the assimilation of elemental phosphorus by marine organisms assessed. Histology and hematology of 'red' herring and lobsters were conducted. Methods were developed for direct determination of elemental phosphorus by gas-liquid chromatography and direct determination of fluoride in water. The Electric Reduction Company modified its pollution abatement procedures and was reopened after the investigation. (See W74-00706 thru W74-00712) (Auen-Wisconsin)
W74-00705

COEXISTENCE OF A FISHERY AND A MAJOR INDUSTRY IN PLACENTIA BAY,
Fisheries Research Board of Canada, Halifax (Nova Scotia).
D. R. Idler.
In: 'Effects of Elemental Phosphorus on Marine Life,' Fisheries Research Board of Canada, Research and Development, Halifax, Nova Scotia, Circular No. 2, November 1972, p 1-6. 8 fig.

Descriptors: *Water pollution effects, *Fisheries, *Industries, *Marine fish, *Phosphorus, *Canada, Ammonia, Fluorides, Fishkill, Magnesium compounds, Toxicity, Herrings, Lobsters, Sea water, Trout, Salmonids, Hydrogen ion concentration, Sulfur compounds, Bottom sediments, Pollution abatement, Dredging, Waste water treatment, Social aspects.
Identifiers: *Placentia Bay (Newfoundland), Cod, 'Red' herring, Fluorapatite, Elemental phosphorus.

The Placentia Bay, Newfoundland fishery, principally for herring, cod, and lobsters, showed extensive fish mortalities, coinciding with the opening of a phosphorus plant. Plant effluents included so-called 'phossy' water containing phosphorus, cyanide and ammonium ion; water from the pelleting plant contained the majority of the fluoride; and water from the dryers contained sulphur dioxide. The fluosilicic acid emitted required neutralization; this fact coupled with high fluoride content and large volume of the effluent and possibly seawater pump corrosion, resulted in incomplete neutralization. Immobilization of fish by low pH offers one explanation why fish did not avoid exposure to phosphorus. Phosphorus quantities in the effluent were far greater than those required to kill the species. Even if the effluent discharge was halted, the accumulation of phosphorus on the bottom was sufficient to kill fish in that vicinity. Also sulphur dioxide and ammonia in effluent were toxic because of the relatively large quantities present. Bioassays were carried out on bottom sediments, confirming laboratory studies that bottom sediments were extremely toxic to fish. The phosphorus plant was reopened after the toxic substances in its effluent were treated and retained on the premises. (See also W74-00705) (Jones-Wisconsin)

DECOMPOSITION OF PHOSPHORUS IN WATER,
Memorial Univ. of Newfoundland, St. John's. Dept. of Chemistry.
E. Bullock, and M. J. Newlands.
In: 'Effects of Elemental Phosphorus on Marine Life,' Fisheries Research Board of Canada, Research and Development, Halifax, Nova Scotia, Circular No. 2, November 1972, p 55-56.

Descriptors: *Degradation (Decomposition), *Phosphorus, *Sea water, *Canada, Anions, Oxidation, Solubility, Analytical techniques, Colloids, Suspension.
Identifiers: Elemental phosphorus, *Placentia Bay (Newfoundland), Long Harbour (Newfoundland).

Investigation of the pollution problem in Long Harbour of Placentia Bay, Newfoundland, called for cooperative research involving many agencies and independent bodies. Studies of fundamental problems, estimation of low concentrations of elemental phosphorus and oxidation of elemental phosphorus in solution or suspension were undertaken. Elemental phosphorus was analyzed by a modification of the method of the Electric Reduction Company of Canada Limited. The best results gave suspensions containing up to 200 ppm elemental phosphorus. The half-life for the oxidation of white phosphorus in suspension shows that it would take several days to reduce the elemental phosphorus concentration of ERCO effluent to a value below tolerance level values for humans. It is likely that the TLV for fish is considerably smaller than for humans since body weight and rate of respiration are broth major factors. Moreover, studies have made it clear that very little dilution occurs in Long Harbour. It follows that no elemental phosphorus should be emitted from the ERCO plant. The plant has installed a new treatment plant in order to continue operations. (See also W74-00705) (Jones-Wisconsin)

CAPACITY OF AN ESTUARY TO ACCEPT POLLUTANTS,
Bedord inst., Dartmouth (Nova Scotia). Marine Ecology Lab.
R. W. Trites.
In: 'Effects of Elemental Phosphorus on Marine Life,' Fisheries Research Board of Canada, Research and Development, Halifax, Nova Scotia, Circular No. 2, November 1972, p 57-69. 11 fig, 8 ref.

Descriptors: *Estuaries, *Pollutants, *Self-purification, *Measurement, Tidal effects, Model studies, Solubility, Dispersion, Diffusion, Circulation, Bays, Mixing, Winds.
Identifiers: Flushing rates.

Concentration of pollutant at any given point in the environment will depend upon rate and concentration of effluent being discharged, decomposition rate of the pollutant, and dilution rate due to mixing with 'clean' water. Attention is focused on dilution rate. The rate of flushing will depend upon the strength of tidal and non-tidal currents, wind, wave, and swell action, precipitation and fresh water discharge and physical configuration of the area involved. If the response of the water to these forces were understood, the flushing time could be computed in principle and the concentration and distribution of pollutant predicted for any given situation. In practice, a semi-empirical approach must be taken. In many coastal embayments where pollution or potential pollution exists, the circulation and diffusion processes are the result of a number of factors, and frequently no single factor is predominant at all times. Meteorological parameters may frequently be dominant. Experimental tracer techniques, combined with measurements taken over various conditions, appear the most useful approach to the problem. It is probably wise to consider dilution rates at times to be an order of magnitude less than those measured under field conditions. (See also W74-00705) (Jones-Wisconsin)
W74-00708

AN ASSESSMENT OF THE ASSIMILATION OF ELEMENTAL PHOSPHORUS BY NEWFOUNDLAND MARINE ORGANISMS IN THE 1969 POLLUTION PROBLEM AND IN 1970 MONITORING OPERATIONS,
Fisheries Research Board of Canada, Halifax (Nova Scotia). Halifax Lab.
R. G. Ackman, R. F. Addison, and J. Hingley.
In: 'Effects of Elemental Phosphorus on Marine Life,' Fisheries Research Board of Canada, Research and Development, Halifax, Nova Scotia, Circular No. 2, November 1972, p 71-109. 3 fig, 18 tab.

Descriptors: *Phosphorus, *Marine fish, *Water pollution effects, *Analysis, Monitoring, *Canada, Fishkill, Herrings, Mortality, Fish diseases, Sea water, Bioassay, Lobsters, Crabs.
Identifiers: Elemental phosphorus, *Placentia Bay (Newfoundland), Long Harbour (Newfoundland), 'Red' herring, Cod.

Results of analyses on field specimens of fish and other marine organisms from Placentia Bay, Newfoundland, for elemental white (or yellow) phosphorus are reported. The problem was delineated in 1969, and more controlled sampling was done in 1970. Determination of phosphorus was carried out by gas-liquid chromatography. On a wet weight basis one ppb was detected and measured, and, by concentrating the organic solvent by a factor of 10, detection limit was 0.1 ppb or better. Herring are much more susceptible than other fish to hemorrhagic effects from elemental phosphorus poisoning. The conclusion reached in late 1969 concerning herring was that fish accumulating 500-1000 ppb of elemental phosphorus in the flesh died rapidly at or near the scene of exposure. Exposure leading to lesser accumulations, 50-100 ppb, may have permitted herring to travel considerable distances before death. The year 1970 opened with great concern about 'red' herring from the commercial fishery in Southern Harbour. It is not an unreasonable supposition that more than 40 ppb elemental phosphorus in herring flesh is lethal within one or two days. Studies were also made on cod, sculpin, flatfish, flounder, crab, lobster, salmon, smelt, and miscellaneous fish. (See also W74-00705) (Jones-Wisconsin)

OBSERVATIONS ON MORTALITIES OF BENTHIC ORGANISMS AFTER CONTAMINATION OF THE BOTTOM OF LONG HARBOUR, PLACENTIA BAY, NEWFOUNDLAND WITH ELEMENTAL PHOSPHORUS,
Bedford Inst., Dartmouth (Nova Scotia). Marine Ecology Lab.
D. L. Peer.
In: 'Effects of Elemental Phosphorus on Marine Life,' Fisheries Research Board of Canada, Research and Development, Halifax, Nova Scotia, Circular No. 2, November 1972, p 181-186. 2 fig, 3 tab, 4 ref.

Descriptors: *Phosphorus, *Mortality, *Benthic fauna, *Bottom sediments, *Water pollution effects, *Canada, Mussels, Fishkills, Toxicity, Amphipoda, Particle size, Analytical techniques.
Identifiers: Elemental phosphorus, *Long Harbour (Newfoundland), *Placentia Bay (Newfoundland), Sand dollars, Sea anemone.

Following opening of an elemental phosphorus producing plant in Long Harbour, Placentia Bay, Newfoundland, divers observed dead fish upon the bottom throughout Long Harbour. Mortalities were confined to water less than 18 m in depth. Sediments were investigated for possible toxic

materials and mortalities of benthic invertebrates. Where depth permitted, sediment samples were taken by divers inserting a plastic tube. When depths were over 13 m the sediment was cored after being brought up in a bottom grab. Which sediment type or size fractions contained the highest proportion of elemental phosphorus was determined. Because of color, consistency, and melting point, it was concluded the material found was elemental (yellow) phosphorus. Apparently a large amount of the phosphorus in the Long Harbour sediment was in lumps of pure phosphorus less than 1/2 mm in diameter. There was some visual evidence of selective mortality among benthos. Live mussels were found within 300 m of the effluent pipe while scallops within this area were all dead. With some exceptions, the benthic infaunal community appeared normal in terms of mean wet weight numbers, and species composition compared to similar depth and substrate in a relatively non-polluted area. SYMPTOMS OF 'RED' HERRING IN RELATION TO THE MASS MORTALITIES IN PLACENTIA BAY, FEBRUARY--APRIL 1969,
Fisheries Research Board of Canada, St. John's (Newfoundland). Biological Station.
J. H. C. Pippy, V. M. Hodder, and L. S. Parsons.
In: 'Effects of Elemental Phosphorus on Marine Life, 'Fisheries Research Board of Canada, Research and Development, Halifax, Nova Scotia, Circular No. 2, November 1972, p 187-191. 1 fig, 9 ref.

Descriptors: *Herrings, *Phosphorus, *Mortality, *Toxicity, Industrial plants, *Canada, Pathology, Fishkill, Water pollution effects, Fish diseases.
Identifiers: *'Red' herring symptoms, *Placentia Bay (Newfoundland).

During February to April 1969 mass mortalities of herring occurred in Placentia Bay, Newfoundland. Dead and drying fish exhibited a bright red skin coloration. To determine the cause, autopsies were performed on both 'red' and normal herring obtained during the field investigations. Many herring were examined grossly for evidence of abnormal quantities of parasites and of abnormal changes in appearance of external and internal organs and tissues. Comparison of normal blood with that of 'red' herring revealed extensive destruction of erythrocytes. Fungi were ruled out as possible cause of the mortalities. Samples from extensive phytoplankton blooms in the northern half of Placentia Bay during mid-and late April did not reveal any form of toxin-producing algae, nor did high concentrations of the phytoplankton have any effect on sticklebacks held in aquaria. It was concluded that the mass mortalities of herring were caused by the presence of elemental phosphorus in the bay. Those which died in the contaminated area very likely represent acute cases of hemolysis, whereas those which survived and exhibited green intestines when caught some time later probably represent chronic cases. W74-00711

ANALYSIS OF ELEMENTAL PHOSPHORUS AND SOME OF ITS COMPOUNDS BY GAS CHROMATOGRAPHY,
Fisheries Research Board of Canada, Halifax (Nova Scotia). Halifax Lab.
R. F. Addison.
In: 'Effects of Elemental Phosphorus on Marine Life, 'Fisheries Research Board of Canada, Research and Development, Halifax, Nova Scotia, Circular No. 2, November 1972, p 233-237. 2 fig, 19 ref.

Descriptors: *Analytical techniques, *Phosphorus, *Phosphorus compounds, *Gas chromatography, Sediments, Absorption, Plant tissues, Toxicity, Marine plants, Marine animals, Stability, *Canada, Bioassay, Pollutant identification.
Identifiers: Elemental phosphorus, *Placentia Bay (Newfoundland).

Results of some short term toxicological and chemical studies initiated by extensive herring mortality in Placentia Bay, Newfoundland, are reviewed. Direct determination of elemental (yellow) phosphorus by gas-liquid chromatography is described. The method allows the specific detection and estimation of elemental phosphorus in the subnanogram range in samples, including sediments, water, and plant or animal tissues. The approach was to partially isolate elemental phosphorus by extraction with a suitable organic solvent such as benzene or isooctane. An extract aliquot was then subjected to gas-liquid chromatography on a non-polar column. Elemental phosphorus was eluted within a few minutes of injection and measured in a P-sensitive and P-specific detector. Gas-liquid chromatographical methods for detection of hypophosphite, phosphite, and phosphate, in the nanogram range, as their trimethylsilyl derivatives, are discussed. The products of elemental oxidation in water were studied using these procedures. Toxicity of elemental phosphorus to marine organisms and its uptake into plant and animal tissues is reviewed. Something of how elemental phosphorus behaves in aqueous and in biological systems is now known and its toxicity to marine organisms well defined. However, the major toxicological question of how phosphorus kills is still unsolved. (See also W74-00705) (Jones-Wisconsin)
W74-00712

NITROGEN FIXATION BY ANABAENA CYLINDRICA. I. LOCALIZATION OF NITROGEN FIXATION IN THE HETEROCYSTS,
California Univ., San Diego, La Jolla. Dept. of Chemistry.
N. M. Weare, and J. R. Benemann.
Archiv fur Mikrobiologie, Vol 90, No 4, p 323-332, 1973. 4 fig, 39 ref.

Descriptors: *Nitrogen fixation, *Anabaena, *Cytological studies, Oxygen, Light, Carbon dioxide, Inhibition, Cyanophyta.
Identifiers: *Anabaena cylindrica, *Heterocysts, Dark.

The experiments described indicate that heterocysts are the main, probably exclusive, sites of nitrogen fixation in both air- and N2-grown cultures of Anabaena cylindrica. The blending experiments indicate that filament breakage occurs preferentially at the junction between vegetative cells and heterocysts, and that breaking this connection results in a loss of nitrogenase activity. Correlation of filament breakage at the heterocysts with loss of nitrogen fixation activity was found with both air- and N2-grown cultures and under aerobic and anaerobic blending and assay conditions. The kinetics of the loss of nitrogen fixation activity during aerobic dark incubation and its recovery after transfer to the light can be explained in terms movement of reductant- and ATP-generating supplies from the vegetative cells to heterocysts. The data support the view that in the dark aerobic assays ATP was the limiting substrate of nitrogenase, whereas after three hours of dark aerobic incubation the reductant supply became limiting. In a hypothetical model shown vegetative cells provide reduced carbon compounds to the heterocysts which utilize them to generate NADPH which is then able to reduce nitrogenase through ferredoxin. NUTRIENT LOADING FROM A SEPARATE STORM SEWER IN MADISON, WISCONSIN,
Wisconsin Univ., Madison. Water Chemistry Program.
J. W. Kluesener, and G. F. Lee.
International Biological Program, Deciduous Forest Biome, Lake Wingra Study, (Mimeo) (1972), 30 p. 16 fig, 3 tab, 14 ref. EPA Project 16010 EHR.

Descriptors: *Eutrophication, *Water pollution sources, *Storm drains, *Urban runoff, *Wisconsin, Storm water, Nutrients, Rainfall, Watersheds (Basins), Nitrogen, Phosphorus, Suspended solids, Ammonia, Nitrates, Leaching, Vegetation, Fertilizers, Roads, Litter, Fallout, Organic matter.
Identifiers: *Nutrient sources, Madison (Wis.), *Lake Wingra (Wis.).

Potential importance of nutrient loading from separate storm sewers prompted study of relationship between rainfall and runoff into Lake Wingra, Wisconsin. Nutrient concentration variability throughout a storm and for different seasons, nutrient loading annually, potential nutrient sources, sampling requirements to quantify loadings, and significance relative to other nutrient sources were evaluated. Approximately 15% of rainfall appears as surface runoff. Nutrient and suspended solids concentrations were usually greatest during early stages of runoff events, decreasing with time. Phosphorus concentrations were greatest in spring and fall; nitrogen concentrations were greatest in spring. Rainfall appeared the major source of inorganic-N. Phosphorus generally resulted from accumulated litter and possibly automotive exhaust. Barring availability of suitable flow proportioned sampler, the next most appropriate sampling procedure would be to characterize the particular basin by collecting flow and chemical data over fairly short time intervals for several storms. Samples should continue to be collected over the same short time intervals but flow data and historical relationship between flow and concentration should be used judiciously to select an appropriate number of samples for chemical analyses. Approximately 80% of the total phosphorus and 35-40% of the total nitrogen influent to Lake Wingra arises from urban runoff. (Jones-Wisconsin)
W74-00716

GLUTAMINE SYNTHETASE OF THE NITROGEN-FIXING ALGA ANABAENA CYLINDRICA,
Dundee Univ. (Scotland). Dept. of Biological Sciences.
M. W. N. Dharmawardene, A. Haystead, and W. D. P. Stewart.
Archiv fur Mikrobiologie, Vol 90, No 4, p 281-295, 1973. 11 fig, 9 tab, 37 ref.

Descriptors: *Cytological studies, *Enzymes, *Nitrogen fixation, *Anabaena, Mode of action, *Cyanophyta, Metabolism.
Identifiers: *Glutamine synthetase, *Anabaena cylindrica, Biosynthesis.

Glutamine synthetase characteristics in Anabaena cylindrica were determined to demonstrate whether it possesses features of bacterial glutamine synthetase making it most efficient as an assimilatory mechanism under low ammonia concentrations and whether in blue-green algae it is subject to the rigorous control mechanisms demonstrated in some other systems. Presence of such a regulatory system could imply a central role for this molecule in nitrogen metabolism of the group. High levels of glutamine synthetase are present in aerobically grown N2-fixing cultures. The enzyme is soluble, has a pH optimum of 6.5-7.5 and a temperature optimum at 30-40C. Partially purified preparations are stable in air at 5C for at least three days. Enzyme activity is regulated at several levels: possibly by repression and derepression of the enzyme in response to ammonia level; by variation in the manganese ions to ATP ratio with optimum activity at a 1:1 ratio; and by feedback inhibition, possibly cumulative. Evidence suggests absence of a covalent enzyme modification of the type found in E. coli. Its levels are almost twice as high on a protein basis in the

heterocysts as in the vegetative cells. (Jones-Wisconsin)
W74-00717

DETERGENT PHOSPHATE AND EUTROPHICATION IN AUSTRALIA,
J. M. Hartwell.
Report March 1973. 23 p. 96 ref.

Descriptors: *Detergents, *Phosphates, *Eutrophication, *Australia, Waste water treatment, Europe, Limiting factors, Sea water, Nitrilotriacetic acid, Canada, United States, Great Lakes, Public health, Carbon, Phosphorus, Mitrogen.
Identifiers: Sweden, Germany, Switzerland, United Kingdom.

Water pollution problems in Australia are compared with those in the United States, Canada, Sweden, Germany, Switzerland, and United Kingdom. Australia, even though an industrial nation and not abundantly supplied with water, has few eutrophication problems. Although there are shortcomings in sewerage facilities, the other contributing factors, large inland lakes close to urban and industrial centers, are absent. Some controversy remains regarding the relative importance of the various nutrient elements in limiting algal growth. The idea of a single element limiting algal growth in all waters under all conditions is no longer acceptable. In waters of low primary productivity, many elements, frequently phosphorus may be limiting, but in heavily polluted, eutrophic waters phosphorus is always available in excess, and organic carbon and nitrogen are most often limiting. Arguments regarding the usefulness of banning phosphates from detergents have been largely superseded now that it is known that simple chemical precipitation during primary sewage treatment removes far more phosphate and at lower cost than any restrictions on detergent formulations. The suggestion is made that the study of cultural eutrophication in Australia should be the work of a permanent government committee under the Federal Department for the Environment and Conservation. (Jones-Wisconsin)

A MATHEMATICAL MODEL OF THE NUTRIENT DYNAMICS OF PHYTOPLANKTON IN A NITRATE-LIMITED ENVIRONMENT,
Utah Water Research Lab., Logan.
W. J. Grenney, D. A. Bella, and H. C. Curl, Jr.
Biotechnology and Bioengineering, Vol 15, No 2, p 331-358, 1973. 9 fig, 2 tab, 34 ref.

Descriptors: *Phytoplankton, *Mathematical models, *Nitrates, *Absorption, Cytological studies, Nitrogen, Growth rates, Plant physiology, Kinetics, Cultures.
Identifiers: *Intracellular nitrogen storage, *Luxury uptake, Batch cultures, Chemostat cultures.

A three-compartment mathematical model is presented which reparsents a phytoplankton population having the capability to store nitrogen in a nitrate-limiting environment. Growth rates are represented by saturation kinetics based on concentrations in intracellular nutrient pools. The model distinguishes three forms of intracellular nitrogen to provide a conceptually realistic means of describingnutrient flow through a biological system and can be used as part of a larger model in investigating mechanisms associated with nutrient limitation and recycling in natural environments to demonstrate the changes which may occur in the nitrogenous constituents of a phytoplankton population with time and environmental conditions. It can quantitatively represent phytoplankton growth dynamics observed in chemostat experiments. It also has been shown to, at least qualitatively, represent the temporal variations in intracellular nitrogen composition of phytoplankton populations in chemostat and batch experiments. Some problems encountered in estimating parameters and applying a one-compartment Monod model can be explained by the intracellular storage phenomenon. (Jones-Wisconsin)

RESPONSE OF AQUATIC LIFE TO SALINITY, TEMPERATURE, DISSOLVED OXYGEN, AND WATER FLOW,
California Univ., Davis. Dept. of Water Science and Engineering.
A. W. Knight, and R. W. Brocksen.
In: University of California-Davis Water Resources Center Annual Report No 25, ; 15-25, 1972. 3 fig, 2 tab.

Descriptors: *Fish food organisms, *California, *Opossum shrimp, *Striped bass, Salinity, Temperature, Dissolved oxygen, Flow, Bioassay, Estuaries, Respiration, Vitamins, Juvenile fish, Growth rates, Metabolism, Detritus, Diatoms, Fish diets, Fish physiology.
Identifiers: *Sacramento-San Joaquin Delta estuary.

Bioassay techniques were conducted to determine the conditions of temperature and salinity appropriate for the survival of the opossum shrimp (Neomysis awatschensis), an important food source for young striped bass. Since conditions of the Sacramento-San Joaquin Delta estuary are changing and the water may become saline with future diversions it is important to ascertain the response of Neomysis to increased salinity. This study used variations in respiration as a salinity response measure. The bioassay procedure was based on the quantal response in a series of salinity concentrations along a gradient of temperatures. The opossum shrimp resides in the Delta at salinities ranging from freshwater to 30% seawater. Changes in oxygen consumption were recorded over a salinity range of 5 to 70% seawater and in temperatures ranging from 6 to 21C. The respiratory metabolism of juvenile striped bass (Morone saxatilis) was measured at five water temperatures; 16C appears to be the thermal optimum in terms of energetic costs of metabolism. The hemoglobin content of the blood and the quantity of fat stored in the liver were studied as an index to some physiological parameters in analyzing the effects of temperature, salinity and chemical toxicants on the striped bass. ON THE EFFECT OF POLLUTION ON SURFACE WATERS,
J. Turoboyski.
Gospodarka Wodna, Vol 30, No 1-2, p 129-138, 1970. 13 ref.

Descriptors: Surface waters, *Sewage treatment, *Water pollution effects, *Salinity, Sulfates, Eutrophication, Nitrates, Phenols, Toxins, *Heavy metals, Salts, Chlorides, Chromium, Lead, Industrial wastes, *Thermal pollution, Trophic level, Primary productivity, Copper.
Identifiers: *Poland (Vistula River).

Present treatment of municipal and industrial sewage, in spite of removing the most dangerous pollutants, proves insufficient in certain cases, causing mineralization of Polish rivers. Basic pollutional aspects are salinity, toxicity, and warming of water. Pollution from salts not constituting algal food, sensu stricto, from both municipal and industrial sewage and ground waters from mines is well known. Since sewage purification from excessive salinity by physical and chemical methods is expensive and not yet feasible on a large scale, salinity will apparently increase with industrial development and growing river pollution. Methods exist for removal of salts (with wide ranging toxicities) caused by heavy metals in sewage treatment plants but the process is not adequately carried out. Certain quantities are discharged into rivers and they are not subject to self-purification processes. Artificial heating of water reservoirs, caused by cooling water discharges from power plants and steel mill wastes, and other industries, increased within the last few years. Heating by even 1 to 2C above normal, on a permanent basis, may induce certain biological changes. (Jones-Wisconsin)
W74-00722

THE 'PALMELLOID' STATE IN A BLUE--GREEN ALGA, ANABAENA SP. I. PRELIMINARY REPORT,
California State Coll., Pa. Dept. of Biological Sciences.
S. C. Bausor, and J. L. Agona.
American Journal of Botany, Vol 60, No 3, p 223-227, 1973. 3 fig, 1 tab, 21 ref.

Descriptors: *Cytological studies, *Plant morphology, *Cyanophyta, *Anabaena, Metabolism, Cultures.
Identifiers: *Palmelloid state.

An Anabaena, in the laboratory, had the unusual habit of going into a chroococcoid (palmelloid) phase of development. Observations of its terrarium habitat and its culture are reported in an effort to analyze the meaning of the palmelloid state in general. The terrarium growth was characterized by an exceedingly slimy greenish spread, without symmetical form. Continued growth of these masses and new conversions of filaments resulted in the amorphous slime covering. Developments of the alga in synthetic media are described. Early growth of newly transferred trichomes of this Anabaena strain in cultures showed no evidence of palmelloid development, however, the palmelloid phase reappeared in old cultures. This late appearance of the palmelloid state indicates a changed environment that could involve autointoxication, depletion of carbon dioxide, and change in reaction (pH) of the medium. Since the change involves excessive slime production, whatever the immediate cause, it seems probable that the effect is a change in metabolic gene action related to slime production. It is not formed during rapid growth which seems to favor chain development. The palmelloid state evidently signifies a change in metabolic balance, the unbalanced growth favoring slime production at low metabolic rates. (Jones-Wisconsin)
W74-00723

ALGAL RESPONSE TO GETERGENT PHOSPHATE LEVELS,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
D. E. Francisco, and C. M. Weiss.
Journal of Water Pollution Control Federation, Vol 45, No 3, p 480-489, 1973. 5 fig, 6 tab, 15 ref.

Descriptors: *Algae, *Detergents, *Phosphates, *Eutrophication, Waste water (Pollution), Bioassay, Waste water treatment, Tertiary treatment, Surveys, Laundering.
Identifiers: Non-phosphorus detergents.

The ability of treated (primary, secondary, and tertiary) domestic wastewater containing phosphate and nonphosphate detergents to support algal growth in receiving waters was determined by algal bioassay. Wastewaters containing phosphate and nonphosphate detergents were collected from a test population. In 12 out of 18 cases, phosphorus detergent wastewater allowed the same growth in algal assay as the nonphosphorus detergent wastewater. Tertiary treatment for phosphorus removal resulted in significantly less growth than secondary treatment. The tertiary-treated phsophorus detergent wastewater allowed significantly greater growth than the nonphosphorus detergent wastewater at a 2% con-

centration. The tertiary-treated nonphosphorus detergent wastewater allowed the same growth as the lake controls at all dilutions. At 1 and 2%, tertiary-treated phosphorus detergent wastewater allowed greater growth than one of the lake controls. Simply removing detergent phosphates from wastewater would have no practical significance in eutrophication control except in those cases where a lake is very strongly phosphorus-limited and wastewater is the principal source of influent phosphorus. Tertiary phosphorus removal to perhaps extremely low values (depending on dilution) can minimize nutrient enhancement of receiving waters. (Jones-Wisconsin)

THE EFFECTS OF STRIP MINING UPON NAVIGABLE WATERS AND THEIR TRIBUTARIES: DISCUSSION AND SELECTED BIBLIOGRAPHY.
Pittsburgh Univ., Pa. Graduate Center for Public Works Administration.

Available from the National Technical Information Service as AD-749 802, $3.00 in paper copy, $1.45 in microfiche. Prepared for Civil Works Directorate, Army Corps of Engineers, July 1972. 94 p. 1 fig, 10 tab, 278 ref. D+CW73-72-C-0048.

Descriptors: *Strip mine wastes, *Navigable waters, *Tributaries, *Bibliographies, Water pollution effects, Mine drainage, Runoff, Sedimentation, Water chemistry, Streams, Spoil banks, Land reclamation, Environmental effects, Erosion, Water quality, Legislation, Acid mine water, Euthrophication, Phosphates, Hydrogen ion concentration, Water utilization, Pollution abatement, Mining.

The principal effects of strip mining on waterways include alterations in runoff and sedimentation, water chemistry, stream ecology, and water utilization. The two principal approaches to abatement of strip mine effects are land reclamation and treatment of contaminated discharges. Land reclamation treats many of the effects of strip mining while treatment considers primarily the mine drainage problem. Strip mined land can be regraded and revegetated to control runoff and erosion and to reduce the formation of acid or highly mineralized drainage. Mine discharges which can be localized can be treated chemically or physically to remove suspended and dissolved solids. To reduce the concentrations of pollutants in streams, impoundment or dilution may be utilized. The most direct control is limitation by location and extent of strip mining. The several treatment methods, considered in the literature and in some cases applied as full or pilot scale treatment plants, include neutralization, distillation, ion exchange, reverse osmosis, electrodialysis and the physical processes of dilution, sedimentation and impoundment. A comprehensive bibliography of selected references is included, especially dealing with coal strip mining. (Jones-Wisconsin)

ENVIRONMENTAL CONTROL OF GAMETOGENESIS IN LAMINARIA SACCHARINA. II. CORRELATION OF NITRATE AND PHOSPHATE CONCENTRATIONS WITH GAMETOGENSIS AND SELECTED METABOLITES,
Simon Fraser Univ., Burnaby (British Columbia). Dept. of Biological Sciences.
S. I. Hsiao, and L. D. Druehl.
Canadian Journal of Botany, Vol 51, No 5, p 829-839, 1973. 5 fig, 2 tab, 29 ref.

Descriptors: *Reproduction, *Marine algae, *Environmental control, *Nitrates, *Phosphates, Metabolism, Plant growth, Plant morphology, Sea water.
Identifiers: *Laminaria saccharina, *Gametogenesis.

Using a synthetic seawater medium under optimal light and temperature conditions, the gametophyte growth, morphology, gametogenesis, and metabolites of Laminaria saccharina were studied in different concentrations of nitrate and phosphate in exenic culture. Nitrate and phosphate were required for the various stages of gametophyte development and gametogenesis. Meiospore germination was stimulated with increasing phosphate concentrations under optimal concentrations of nitrate, but inappropriate combinations of nitrate and phosphate concentrations produced an adverse effect. The optimal concentrations of nitrate and phosphate in ASP 2M medium for growing L. saccharina meiospores into gametophytes were 588.3 microgram-atoms nitrate nitrogen per liter and 15 microgram-atoms phosphate phosphorus per liter. The amount of nitrogen available to L. saccharina would determine the amount of lipid accumulation, since nitrogen deficiency limits growth, and causes photosynthetic activity to be directed to lipid synthesis. Nutrient concentrations giving rise to the greatest fertility also gave rise to the highest ratios of RNA/DNA and protein/RNA. Antheridial production occurred over a wider range of nitrate and phosphate concentrations than oogonial production. Percentage fertility was greater for the male gametophyte. This indicated that the female gametophyte was the limiting agent in sexual fusion. (Jones-Wisconsin)

CONTRIBUTIONS TO THE KNOWLEDGE OF BIOGENIC ELEMENTS AND PHTOPLANKTON ASSOCIATIONS DYNAMICS IN FRASINET POND DURING NOVEMBER 1969-NOVEMBER 1970, (IN RUMANIAN),
I. Chiosila, and A. Schneider.
Bul Cercet Piscic. Vol 30, No 3/4, p 45-62. 1971. (English summary).
Identifiers: Aphanizomenon-Flos-Aquae, *Biogenic elements, Chlorophyta, Chrysophyta, Cyanophyta, Nitrogen, Organic, Phosphorus, *Phytoplankton, Ponds, Reeds, *Romania (Mostistea River), Season, Zooplankton, Hydrogen ion concentration.

Relations between the dynamics of temperature, pH, N, P and organic matter and phytoplankton dynamics are established in Frusinet pond (on river Mostistea, Romania). Phytoplankton biomass varied depending on the season; generally, the physicochemical regime favored phytoplanktonic and zooplanktonic community development. Highest values of remnant phytoplankton frequency were recorded near the end of summer or early fall (about 7.03 mm3/1 in Aug. for Aphanizomenon flos-aquae). The richest phytoplankton was found near the pond center, followed by the reed plot zone and the littoral zone. The Cyanophyta, Chrysophyta, and Chlorophyta had nearly equal frequencies of 28.2%, 33.1% and 32.5%, respectively; Pyrrophyta showed weak development.--Copyright 1973, Biological Abstracts, Inc.

INHIBITION OF OXYGEN EVOLUTION IN VOLVOX GLOBATOR BY CULTURE FILTRATES FROM PANDORINA MORUM,
Kentucky Univ., Lexington. Dept. of Botany.
D. O. Harris.
Microbios, Vol 3, No 9, p 73-75, 1971. 1 tab, 8 ref. OWRR A-018-KY (5).

Descriptors: *Algal control, *Algal toxins, *Inhibitors, Cultures, Chlorophyta, Photosynthesis, Respiration, Biochemistry.
Identifiers: *Pandorina morum, *Algal growth inhibitors, *Volvox globator.

A complex system of growth inhibition had been observed in the family Volvocaceae (colonial green flagellates). Culture filtrates from eleven different genera and species had been surveyed and it was found that the culture filtrate from Pandorina morum produced the most effective toxin, inhibiting most members of the group while Volvox globator proved to be the most sensitive. An examination was made of the effects of the inhibitor produced by Pandorina morum on photosynthesis and respiration. The first firm evidence of a possible mode of action of an algal inhibitor, apparently a specific inhibitor of photosynthesis, is presented. Cultures of strains of Volvox globator and Pandorina morum were grown aseptically. The clark electrode was employed to measure the rate of oxygen consumption and evolution. Respiration was measured as oxygen consumption and photosynthesis was measured as oxygen evolution. It was observed that one hour exposure of Volvox to culture filtrates of Pandorina resulted in a 65% reduction in the oxygen evolution rate which increased to 91% after 12 hour exposure to the inhibitor. Respiration as measured by oxygen consumption was unaffected. (Jones-Wisconsin)

NITROGEN FIXATION BY OSCILLATORIA (TRICHODESMIUM) THIEBAUTII IN THE SOUTHWESTERN SARGASSO SEA,
Woods Hole Oceanographic Institution, Mass.
E. J. Carpenter.
Deep-Sea Research, Vol 20, No 3, p 285-288, 1973. 2 tab, 14 ref.

Descriptors: *Nitrogen fixation, *Marine algae, *Cyanophyta, Photosynthesis, Analytical techniques, Nitrogen.
Identifiers: *Oscillatoria thiebautii, *Sargasso Sea, Acetylene reduction technique.

Oscillatoria (Trichodesmium) thiebautii, a planktonic blue-green alga, in Atlantic and Indian Oceans appears to fix atmospheric nitrogen, but at low rates relative to its total nitrogen budget. The importance of nitrogen fixation to Oscillatoria was investigated and data collected with the acetylene reduction technique in the southwestern Sargasso Sea presented. Concentrations of nitrate, nitrite, ammonia, and phosphate showed little variation from station to station. Nitrate and nitrite were relatively low. Two forms of Oscillatoria were collected, fusiform and spherical colonies and both fixed nitorgen. According to the characteristics of planktonic marine Oscillaotria, noted by Sournia, both fusiform and spherical colonies belong to O. thiebautii. Nitrogen fixation can be a significant source of nitrogen for Oscillatoria, permitting a doubling of cellular N at a minimum of 12 days and at an average rate of once every 47 days for all samples that fixed nitrogen. If Oscillatoria has division rates typical of other open ocean phytoplankters, then these data suggest that a large portion of its nitrogen must be obtained from sources other than nitrogen fixation, undoubtedly the uptake of combined N compounds. PROTECTION OF WATER AGAINST POLLUTION,
A. Chojnacki.
Gospodarka Wodna, Vol 30, No 1-2, p 42-49, 1970. 1 tab, 9 ref.

Descriptors: *Degradation (Decomposition), *Detergents, *Water pollution effects, Industries, United States, Foreign countries, Water treatment, Sewage treatment, Formulation, *Water pollution control.
Identifiers: *Poland, Detergent uses.

Detergent consumption creates new and growing problems of water purity in receiving and potable waters. Detergents contain two basic component groups: superficial-active components, averaging in content about 20% , and auxiliary mineral and organic components, mainly phosphate, carbonate, sulfite, and sodium perborate mixtures. The principal criterion for classification of superficial-active substances is their ability of electrolytical dissociation in water solutions. Synthetic detergents remain unchanged in form in sewage system effluents. Generally, they are either not subject to dissolution or dissolve with difficulty, reaching lakes, rivers, and basins and causing distrubances in water self-purification and deterioration of water quality. Water treatment methods indicate that detergents mainly influence sedimentation, filtration, aeration, and coagulation. Numerous studies and investigations indicate a negative influence of detergents primarily on bacterial flora. It seems that a content of about 0.2 mg/l of superficial-active substances may be the admissible limit for superficial waters. Solutions should be based not on neutralization in sewage and purified water, but on research for new superficial-active products or bacterial flora producing easy biological decomposition of these products. (Jones-Wisconsin)
W74-00731

LET AS A DETERMINANT OF OXYGEN ENHANCEMENT RATIO AND SHAPE OF SURVIVAL CURVE FOR CHLAMYDOMONAS,
Medical Research Council, London (England). Experimental Radiopathology Research Unit.
P. E. Bryant.
International Journal of Radiation Biology, Vol 23, No 3, p 217-226, 1973. 6 fig, 1 tab, 16 ref.

Descriptors: *Cytological studies, *Radiation, *Oxygen, *Irradiation, *Chlamydomonas, Aerobic conditions, Anaerobic conditions, Helium, Mathematical studies.
Identifiers: *LET, *Oxygen-enhancement ratio, Chlamydomonas reinhardii, Deutrons, Neutrons, Electrons.

Radiation quality or LET has been widely recognized as a determinant of oxygen-enhancement ratio for biological materials. These experiments were designed to investigate changes in survival curves and oxygen-enhancement ratio over a range of LET values. The electron beam from the MRC linear accelerator was used as source of low-LET radiation. Cells were exposed to electron beam either while resting on membrane filters or in suspension. Dosimetry for the electron beam was based on a comparison of absorbed doses from this beam with those from the linear accelerator x-ray beam, using the ferrous sulphate method. Survival curves for Chlamydomonas were obtained for radiations having different values of LET alpha or stopping power. Irradiations were performed under either aerobic or anoxic conditions. Survival curves changed mostly in respect of extrapolation number or shoulder width, as LET was increased, the final slope remaining almost constant. The mode of variation in oxygen-enhancement ratio was strikingly similar to the pattern of variation in DQ as LET was increased. A straight line relationship was shown to exist between DQ value and oxygen-enhancement ratio when these values were computed for the same experiments at different values of LET alpha. (Jones-Wisconsin)
W74-00732

POLLUTION EFFECTS ON LITTORAL ALGAL COMMUNITIES IN THE INNER OSLOFJORD, WITH SPECIAL REFERENCE TO ASCOPHYLLUM NODOSUM,
Norway Inst. of Water Resources, Oslo.
J. Rueness.
Helgolander wissenschaftliche Meeresuntersuchungen, Vol 24, No 1-4, p 446-454, 1973. 3 fig, 8 ref.

Descriptors: *Water pollution effects, *Phaeophyta, *Algae, Succession, Littoral.
Identifiers: *Norway (Oslofjord), *Littoral algae, *Ascophyllum nodosum, Fucus.

Qualitative changes are obvious when present floristic data is compared with what is known from the earliest collections of algae from the inner Oslofjord, as many easily recognizable species have disappeared or become very rare. In 1897 Ascophyllum nodosum was common and abundant but 20 years later the species had been forced further outward. Two causal categories may be operating as a result of pollution: Polluted water exerts a direct unfavorable effect on growth and development of the alga; polluted water has no direct unfavorable effect on growth and development but in polluted localities indirect biotic factors lead to an unfavorable competitive situation for the species. Growth and development of Fucus distichus spp. edentatus from germlings to fertility and its regrowth and succession in three localities were followed. Growth and development of transplanted Ascophyllum nodosum were compared with native plants in the Drobak area. Well-grown specimens of Ascophyllum nodosum were transplanted to the inner basin and no essential differences in vegetative growth and maturation of generative structures were observed. Increased competition for substrate and the shading effect of Enteromorpha reduces the potential A. nodosum germlings from becoming established. (Jones-Wisconsin)

ON ADVECTION IN PHYTOPLANKTON MODELS,
Florida State Univ., Tallahassee. Dept. of Meteorology.
J. O'Brien, and J. S. Wroblewski.
Journal of Theoretical Biology, Vol 38, No 1, p 197-202, 1973. 8 ref.

Descriptors: *Spatial distribution, *Advection, *Phytoplankton, *Mathematical models, Marine biology, *Food chains, Productivity, Diffusion, Turbulence, Model studies, Biomass, Dynamics, Velocity, Kinetics.
Identifiers: Non-dimensional ratio, Sargassa Sea, Gulf Stream, *Florida continental shelf.

The question explored is: When does advection need to be included in a marine food chain model. The thesis is offered that the non-dimensional ratio, S, is a measure of the importance of advection in determining the spatial structure of plankton distributions in marine food chain models. Scale analysis has been used to deduce this new non-dimensional number, S, whose magnitude indicates the importance of including advection in a marine ecosystem model. When S is greater than 1, advection greatly affects biological productivity; when S is less than 1, advection may be neglected. When S is order 1, advection and biological productivity play competing roles in determining the spatial configuration of the plankton biomass. Some real oceanographic situations where the a priori importance of advection in a spatial marine food chain model is uncertain are considered: for the Sargassa Sea, the parameter values obtained from* the resulting value of S indicates horizontal advection may be neglected when modeling phytoplankton. In the rapidly moving system of the Gulf Stream, the horizontal advection is a dominant factor. This technique is presently being utilized in a lower trophic level model of the West Florida continental shelf. LAKE WASHINGTON,
W. T. Edmondson.
In: Environmental Quality and Water Development, W. H. Freeman, and Co. San Francisco, 1973. C. R. Goldman, editor, p 281-298, 1 fig.

Descriptors: *Eutrophication, *Recreation, Sewage, *Sewage treatment, *Political aspects, Pollution, *Washington, Water quality, Lakes, Diversion, Phytoplankton, Detergents, Planning, Land use, History, Environmental effects.
Identifiers: Puget Sound, Citizen action, Seattle (Wash), *Lake Washington (Wash), Oscillatoria rubesceus.

Development of Seattle and nearby communities led to the use of Lake Washington for sewage disposal in ever increasing quantities from early in the 1900's until the 1960's in spite of diversion of Seattle's sewage to Puget Sound in 1936. Between 1941 and 1954 ten secondary biological sewage treatment plants were established on the lake. However pollution problems multiplied as urban growth continued. Levels of phytoplankton abundance increased drastically in the 1950's. A relatively dense growth of the blue-green alga Oscillatoria rubescens heralded a further deterioration of the lake. Diversion of additional sewage to Puget Sound between 1963 and 1968 resulted in considerable decreases in phosphate concentrations, nitrate and carbon dioxide levels in winter. Summer abundance of phytoplankton also dropped sharply with corresponding increases in water transparency. Detrimental impact on Puget Sound appears minimal. Primary treatment is given to Seattle's outflow which is deposited 3,600 feet offshore at a depth of 240 feet. Diversion of sewage followed increasing public concern and action and state legislation permitting communities to joint together and form a municipality to finance and carry out certain functions. A Seattle area municipality was established by a 1958 vote. The Lake Washington experience can be used as an example of how volunteer citizen action can lead to major accomplishments in protecting the environment. Ways in which this experience may be applied in other places are discussed. A brief review of the controversy about the use of phosphorus-containing detergents is included. (Edwards-North Carolina)

CHEMICAL AND BIOLOGICAL PATTERNS IN THE LOWER COLORADO RIVER SYSTEM,
Arizona Univ., Tucson.
L. G. Everett, J. S. Carlson, and H. K. Qashu.
Journal of the Arizona Academy of Science, Vol 8, No 2, p 91-94, June 1973, 2 fig, 3 tab, 2 ref.

Descriptors: *Eutrophication, *Nutrients, *Algae, *Salinity, *Colorado River basin, Artificial lakes, Lake stages, Sewage, Sediments, Plankton, River systems.

Domestic, industrial, and agricultural activity in the upper Colorado River basin states causes a rise in salinity of nearly 240 ppm above Hoover Dam due to salt loading. About 10.4 million tons of salt per year pass the dam itself. Increasing develop-

ment and water use in the upper and lower basins should cause a progressive increase in water salinity in the river hydrologic system. Spatial and temporal variabilities in system properties are real and are considered of primary importance in the study presented. These changes are caused by the nature of changes in water, sediment, solute, sewage effluent, and recreational product inputs. Degradation of the phytoplankton and zooplankton were observed and changes in species dominance was illustrated across Lake Mead and in other parts of the Lower Colorado River System. Causes of these changes are speculative and may be associated with changes in concentration of essential nutrient species. Limited amounts of some essential micronutrients were documented in areas showing undesirable changes in plankton species. The increase in many ions may cause the absence of changes in biota or serve to enhance the limiting effects of low concentrations of micronutrients. (Muller-Arizona)

PRELIMINARY SURVEY OF MERCURY AND OTHER METALS CONTAINED IN ANIMALS FROM THE FRASER RIVER MUDFLATS,
British Columbia Univ., Vancouver. Inst. of Oceanography.
T. R. Parsons, C. A. Bawden, and W. A. Heath.
Journal of the Fisheries Research Board of Canada, Vol 30, No 7, p 1014-1016, July 1973. 1 tab, 2 ref.

Descriptors: *Water pollution effects, Pacific Coast Region, *Mercury, Aquatic animals, *Benthic fauna, *Municipal wastes, *Sewage, Heavy metals, Aquatic life, Metals, Cations, Coasts, *Canada, Clams, Oysters, Crabs, Pollutant identification, Pollutants, Water pollution, Bays.
Identifiers: Vancouver (British Columbia), *Fraser River (British Columbia), Cowichan River (British Columbia), Kitimat River (British Columbia).

Crabs, oysters, clams, and other benthic animals from Sturgeon Bank (north of the Fraser River main arm) were found to contain larger amounts of mercury and other metals (notably Ag, Cd, and Cu) than did similar specimens from similar British Columbia coastal environments (Roberts Bank, south of the Fraser, Cowichan Bay mudflats, and Kitimat Arm). These higher metal levels are believed to be associated with the municipal sewer outfall from Vancouver. (Brown-IPC)

ORGANOCHLORINE RESIDUES IN HARP SEALS (PAGOPHILUS GROENLANDICUS) CAUGHT IN EASTERN CANADIAN WATERS,
Ontario Ministry of Agriculture and Food, Guelph. Pesticide Residue Lab.
R. Frank, K. Ronald, and H. E. Braun.
Journal of the Fisheries Research Board of Canada, Vol 30, No 8, p 1053-1063, August 1973. 8 tab, 13 ref.

Descriptors: *Polychlorinated biphenyls, *Chlorinated hydrocarbon pesticides, *DDT, *Dieldrin, *Marine animals, Aquatic animals, Water pollution effects, Seawater, Pollutant identification, Animal metabolism, Metabolism, Persistence, Pesticides, Age, Aging (Biological), *Canada.
Identifiers: *Seals (Animals).

Numerous seals from newborn to age 18 years were obtained from the Gulf of St. Lawrence and the Newfoundland and Labrador coasts, and analyzed for DDT and its metabolites. Total DDT levels in blubbers exceeded 2 ppm in Gulf bedlamers and wild beaters, compared to less than 2 ppm for corresponding coast animals. DDT levels increased to 8.7 ppm as the animals matured, but leveled off in femals at 6.5 ppm as they reached breeding age. Dieldrin levels were only 5% of those for total DDT and did not accumulate appreciably in either wild or captive seals. PCB residues were only slightly less than total DDT and showed a similar increase with animal age. Residues in tissues of captive seals were as much as eight times higher than in nature, indicating either that natural diets contain lower residues than the selected diet of captive seals, or that chlorinated organics are assimilated at different rates in wild vs. captive animals. Brain lipids contained only 7-20% of all three chlorinated hydrocarbons found in the extractible fat of blubber, muscle, and liver, indicating a brain barrier. (Brown-IPC)

Identifiers: *Lake Wingra (Wis).

An investigation of seasonal changes in species diversity and biomass of phytoplankton, zooplankton, benthos, and fish in Lake Wingra, Madison, Wisconsin, was conducted during 1970 and 1971. The objective was to obtain ecological data on the biological components of an aquatic ecosystem and to utilize these data along with concurrent chemical data to aid the development of systems models of nutrient and energy fluxes in lake drainage basins. Interpretations of the data reveal several important considerations for models of lake system and future studies of Lake Wingra. Phytoplankton associations, for example, appear to be adaptive, self-organizing systems. Such behavior suggests the possibility to apply optimization principles to phytoplankton models. The data suggest, furthermore, that optimization analysis can be based on size particle distributions of the phytoplankton, which, rather than species, appears to be the basis of phytoplankton categories. Zooplankton and benthos analyses, on the other hand, indicate that energy and nutrient fluxes may be adequately approximated by simulating only a few species. Finally, results of fish studies imply that models of whole lake ecosystems must account for the mobility of predators in estimating their impact on prey populations, which should be characterized by differing spatial and temporal susceptibility to predation. Descriptors: *Thermal pollution, *Heated water, *Pollutants, *Water pollution effects, *Bodies of water, Temperature, Water temperature, Water cooling, Aquatic life.
Identifiers: USSR, *Biocenoses, Hydrobionts.

Heated effluents can have beneficial as well as undesirable effects on hydrobiont activity. Moderate heating within limits of the temperature optimum for organisms stimulates growth of hydrobionts in the absence of pollution and retards their growth in polluted waste water. Heating above the temperature optimum inhibits biological processes and impoverishes ecosystems by reducing the number of species. Further heating of water results in hydrobiont decline. In winter the effects of moderate heating are more beneficial than in summer. An increase in water temperature of 1 to 3 deg C has no significant effect on hydrobiont activity. Observations and experimental studies by Soviet and foreign authors on effects of water temperature on marine organisms are reviewed. (Josefson-USGS)

SOUTHERN CALIFORNIA'S DETERIORATING MARINE ENVIRONMENT, AN EVALUATION OF THE HEALTH OF THE BENTHIC MARINE BIOTA OF VENTURA, LOS ANGELES AND ORANGE COUNTIES,
Center for California Public Affairs, Claremont.
R. C. Fay.
1973. 76 P, 7 FIG, 3 PLATE, 8 TAB, 98 REF, 1 APPEND.

Descriptors: *California, *Marine biology, *Biota, *Aquatic habitats, Oceans, Marine fish, Aquatic life, Marine plants, Kelps, Biological communities, Biomes, Ecology, Environmental effects, Water resources, Water management (Applied), Marine algae.
Identifiers: *Southern California.

This description of the health of the local marine biota was prepared in a framework of consideration of the natural components of the marine environment of southern California and from the viewpoint of the effects of man's actions upon the total biota of the inshore area. This report is offered to encourage the development of an understanding of the biological importance of the various marine habitats of southern California, the major biological groupings now found in these habitats, the relationship of these organisms to one another and to their environment, and the extraordinarily high potential for biological productivity of the local ocean versus that of the land. Attention is called to the large number of species of marine organisms found in the local ocean as an indication of the complexity of the problems in resource management. Several projects are proposed for modification of the shoreline. The proposed projects will have biological effects and some may modify areas of the shoreline which are still in a primitive condition. (Reed-Florida)

Descriptors: *Model studies, *Algae, *Protozoa, *Chlamydomonas, Ciliates, Bacteria, Nitrates, Light intensity, Primary productivity, Secondary productivity, Cultures, Pesticide toxicity, *DDT, *Polychlorinated biphenyls, Water pollution effects.
Identifiers: Chemostats, *Tetrahymena vorax.

Data from continuous cultures of an alga (Chlamydomonas reinhardtii) and protozoan (Tetrahymena vorax) have been used to construct a model of algal standing crop over ranges of light intensity, dilution rate, and nutrient concentration both in the absence and presence of predation by the protozoa. The model predicts that predation can reduce algal standing crop only within certain ranges of the environmental variables. The comparative toxicities of Aroclor 1242, a polychlorinated biphenyl, and DDT, were tested on the alga and protozoan, and also on daphnids, ostracods, and guppies. (EPA)

Descriptors: *Water quality, *Mathematical Models, *Computer Models, Water pollution, *Cycling nutrients, Eutrophication, Dispersion,

Mass Transfer, Nutrients, Oxygen demand, Photosynthesis, Simulation analysis, Estuaries, Dissolved oxygen, Nitrogen, Phosphorus, Carbon.
Identifiers: Delaware River estuary, Potomac River estuary.

The formulation and initial verification of two modeling frameworks are described. The first is directed toward an analysis of the impact of the carbonaceous and nitrogenous components and wastwater on the dissolved oxygen resources of a natural water system. The second modeling framework concentrates on the interactions between the discharge of nutrient, both nitrogen and phosphorus, and the biomass of the phytoplankton and zooplankton populations which result, as well as incorporating the overall impact on dissolved oxygen. The models are formulated in terms of coupled differential equations which incorporate both the effect of transport due to tidal motion and turbulence, and the kinetics which describe the biological and chemical transformations that can occur. The modeling frameworks are applied to the Delaware and Potomac esturaries in order to estimate the ability of such models to describe the water quality effects of carbon, nitrogen, and phosphorous discharges. The agreement achieved between observation and calculation indicate that the major features of the impact of wastewater components on eutrophication phenomena can be successfully analyzed within the context of the models presented. (EPA)

TOXICITY AND ACCUMULATION OF LEAD IN THE COMMON MUSSEL MYTILUS EDULIS IN LABORATORY EXPERIMENT, (IN GERMAN),
Institut fuer Meeresforschung, Bremerhaven (West Germany).
M. Schulz-Baldes.
Mar Biol (Berl). Vol 16, No 3, p 226-229. 1972. Illus. (English summary).
Identifiers: Laboratory tests, *Lead, Lethal limit, Mortality, *Mussel, Mytilus-Edulis, Time, *Toxicity.

In a laboratory experiment, conducted over 130 days, 3 batches of a total of 100 common mussels, M. edulis, were maintained in media containing different Pb concentrations. Two vessels served as controls. There was no acute injury to the mussels; but, over an extended period of time, a marked increase in mortality occurred which was related to the Pb concentration in the medium. The median lethal time (LT50) was computed to be 218 days for the control, 150 days with 0.5 mg Pb/l in the medium, 129 days with 1 mg/l, and 105 days with 5 mg/l. Quantitative analyses of the soft parts of M. edulis by flameless atomic-absorption-spectrophotometry revealed a distinct accumulation of Pb. From a natural Pb content of 8.4 microgram Pb/g dry weight, the Pb concentration increased to 12,840 microgram/g at 0.5 mg/l, to 20,770 microgram/g at 1 mg/l and to 39,830 microgram/g at 5 mg/l. The ratio of the concentration of Pb in the soft parts of M. edulis to the concentration in the medium remained in the same order of magnitude both under laboratory conditions using high Pb concentrations and under in situ Pb levels. Over a period of 130 days, Pb uptake expressed as percentage of Pb offered was 10.9% at 0.5 mg/l, 9.5% at 1 mg/l, and 3.4% at 5 mg/l, respectively.--Copyright 1973, Biological Abstracts, Inc.

HEALTH ASPECTS OF FISH PRODUCTS FROM POLLUTED WATER,
C. Sebastio.
Vet Ital. Vol 23, No 1/2, p 120-128. 1972.

Descriptors: Disposal, Fish, *Food chains, *Italy, *Marine pollution, Poluted coasts, Sewage, Toxicity, Public health, Water pollution effects.

In Italy, 74% of the coastal cities discard their sewage into the sea; only 13.6% of the 8000 km of shoreline is free of pollution. The accumulation of pollutants in the marine food chain is discussed. Strict controls (chemical, toxicological, epidemiological) on fish used for human consumption are suggested.--Copyright 1973, Biological Abstracts, Inc.

SIGNIFICANCE OF DOCKS IN DISSEMINATION OF DIPHYLLOBOTHRIASIS NEAR RIVERS AND LARGE TRANSPORT WATER BODIES (ACCORDING TO DATA FROM THE VOLGA PIERS AND THE VOLGOGRAD RESERVOIR), (IN RUSSIAN),
Institute of Medical Parasitology and Tropical Medicine, Moscow (USSR).
E. P. Razumov, and I. Ya. Mikhailenko.
Med. Parazitol Parazit Bolezn, Vol 41, No 1, p 90-94, 1972, English summary.
Identifiers: *Diphyllobothriasis, Dephyllobothrium-latum, Dissemination, Docks, Fecal, Health, *Human diseases, Occupational categories, Piers, Reservoirs, Rivers, *USSR (Volgograd).

In 1966-1968 in Volgograd and Kyybishev regions of USSR, the population was examined and data from the local sanitary-epidemiological conditions were analyzed. The rate of diphyllobothriasis infestation was established: in fishermen, 10-45%; in dock workers 1.5-1.2%; and in members of crews, 0.6%. Specimens of water (451) and of bottom soil were analyzed in the laboratory. Eggs of Diphyllobothrium latum were found in 180 specimens. Docks were important sources of fecal contamination of the coastal shallow waters of the Middle and Lower Volga. Fishermen, dock workers and crews of the navigating boats must be examined for heminthic diseases and undergo clinical follow-up treatment.--Copyright 1973, Biological Abstracts, Inc.

DYNAMICS OF CHANGES IN CORTICAL ACTIVITY IN ALBINO RATS WITH CHRONIC SILVER INTOXICATION (IN UKRAINIAN),
L. A. Kul's'kyi, P. D. Kharchenko, and P. Z. Stepanenko.
Dopov Akad Nauk Ukr Rsr Ser B Heol Heofiz Khim Biol, Vol 34, No 7, p 660-662, 1972, English summary.
Identifiers: Albino rats, Brain, *Cortical activity, Inhibition, Liver, *Rats, Reflex, *Silver, *Potable water.

The effect of ionic Ag of various concentrations in drinking water (0.5, 2, 20 mg/l) on the conditioned reflex activity of albino rats was studied. An Ag dose of 0.5 mg/l does not affect the conditioned reflexes; an Ag dose of 2 mg/l evokes a disturbance in the conditioned reflex activity after 4-mo. intoxication. An Ag dose of 20 mg/l causes inhibition of excitation at the end of the second mo. of intoxication; as the intoxication time increases, an intensification in the excitation process, differentiation disinhibition and increase in intersignal response quantity are seen. After 5-6 mo. intoxication, the inhibition of positive conditioned reflexes with a progressing growth in inhibition intensity again arises. After 9-mo. intoxication with doses of 20 mg/l, Ag accumulated in brain (24%) and liver (80%) tissues compared with animals which drank the usual town water.--Copyright 1973, Biological Abstracts, Inc.

THE EFFECT OF NUTRIENTS ON THE GROWTH OF BACTERIAL POPULATION IN WATER,
Polish Academy of Sciences, Warsaw. Inst. of Ecology.
W. A. Godlewska-Lipowa.
Bull Acad Pol Sci Ser Sci Biol, Vol 20, No 7, p 473-475, 1972, Illus.
Identifiers: *Bacterial growth, *Nutrients, Trophic types, Water pollution effects, Lakes, *Bactopeptone.

Increase in the number of bacterial cells, obtained after few-hours exposure of isolated water samples, void of zoo- and phytoplankton, was directly proportional to the trophic type of the water-culture medium. The most stimulating effect was produced by bactopeptone, then KNO3 and KH2PO4, and the least (NH4)2SO4. The lower the trophism degree of the lake the more effective was the addition of these substances for bacterial populations.--Copyright 1973, Biological Abstracts, Inc.

TROPHIC STRUCTURE AND BIOACTIVITY OF THE PLANKTON COMMUNITIES IN LOWER REACH OF ELBE ESTUARY; CRITERIA FOR SAPROBIC CLASSIFICATION OF A TIDAL WATER (IN GERMAN),
I. Noethlich.
Arch Hydrobiol Supplement B, Vol 43, No 1, p 33-117, 1972, Illus, English summary.
Identifiers: Estuaries, Algae, Diatoms, Actinocyclus-normannii, Bacteria, Coscinodiscus-lacustris, *Germany Elbe estuary, *Plankton communities, *Saprobic classification, Tidal water, *Trophic structure.

Analysis of the trophic structure of the limnetic plankton community of the Elbe estuary, West Germany, was carried out in 1967. The inflow of organic detrital material favors omnivorous consumers, the biomass of which dominate (75% of total consumer biomass). On account of the specific estuarine conditions there will be a rapid destruction of organic material by bacteria leading to mineralization, with the consequence that inorganic P- and N-substances will not be lacking. Consequently, a specific bloom of autochthonous diatoms (Actinocyclus normannii, Coscinodiscus lacustris) may take place. These algae are apparently not utilized by herbivorous organisms. Measurements of bioactivity indicate an eudynamic and eutrophic situation. The estuary is classified as alpha-mesosaprobic.--Copyright 1973, Biological Abstracts, Inc.

THE EFFECT OF ATRAZINE AND DIURON ON THE PRODUCTIVITY OF CLADOCERA. (EXPERIMENTAL STUDIES), (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Instytut Hidrobilogii.
E. P. Shcherban'.
Identifiers: *Atrazine, Ceriodaphnia-Quadrangula, *Cladocera, *Diuron, Moina-Macrocopa, Productivity, Scapholeberis-Mucronata, *Herbicide toxicity.

The effect of small concentrations of diuron (0.05-0.25 mg/1) and atrazine (1 mg/1) upon the productivity of Cladocera (Moina macroscopa (Straus), Ceriodaphnia quadrangula (Muller), and Scapholeberis mucronata (Muller)) was studied for a 1-15 mo. period. For S. mucronata and C. quadrangula reproduction increases in the first generation and drops rapidly thereafter. In M. macrocopa adaptation in 2-4 generations and an increase in reproduction was observed. The most susceptible to poisons was S. mucronata, which should make a good specimen in toxicological studies of herbicides.--Copyright 1973, Biologocal Abstracts, Inc.

BOTTOM FAUNA OF DEAD VISTULA,
Warsaw Univ. (Poland). Zoological Inst.
L. Klekot.
Pol Arch Hydrobiol. Vol 19, No 2, p 151-166, 1972. Illus.
Identifiers: *Bottom fauna, *Poland (Dead Vistula), *Salinity, *Oxygen, *Water temperature.

The environmental factors in Dead Vistula, Poland, salinity, O2 content, temperature of water and character of bottom were investigated. The qualitative species composition of macrobenthos was analyzed. Special attention was paid to the dependence of the occurrence of common organisms in Dead Vistula on salinity. Seasonal investigations on the dynamics of numbers and biomass distinguished the dominant groups in the overgrown parts and in the parts without plants in 3 regions in various seasons. Considerable differentiation of the bottom fauna and great seasonal changes were observed.--Copyright 1973, Biological Abstracts, Inc.

5D. Waste Treatment Processes

THE WATER BUDGET AND WASTE TREATMENT AT A MODERN DAIRY,
Mississippi State Univ., State College. Water Resources Research Inst.
J. B. Allen, J. F. Beatty, S. P. Crockett, and B. L. Arnold.
Available from the National Technical Information Service as PB-224 792, $3.00 in paper copy, $1.45 in microfiche. Completion Report, July 1973. 30 p, 15 fig, 3 tab, 7 ref. OWRR A-065-MISS (1).

Descriptors: Water demand, *Dairy industry, Lagoons, *Hydrologic budget, *Waste treatment, *Mississippi, *Waste water treatment, Industrial wastes, Biochemical oxygen demand.

This study was concerned with an analysis of the dairy water budget and an evaluation of the efficiency of a 2-cell lagoon waste treatment system for a modern 130-cow dairy at Holly Springs, Mississippi. The water budget at the dairy was determined by means of water meters installed on the main supply line, the alley flushing system, the milking parlor flush tanks, the prep stalls, the milk-room and the waterers. Data collection began on June 15, 1972, and continued through June 15, 1973. The water budget was summarized on a weekly basis by means of a computer print-out. For an average of 114 cows, the average water usage was 16,738 gallons per day (gpd). The amounts of water used in the various components of the dairy were: alley flushing systems, 5,372 gpd; milking parlor flush tanks, 6,869 gpd; prep stalls, 809 gpd; milk-room hot water, 320 gpd; cattle waterers, 2,113 gpd; and miscellaneous, 1,255 gpd. The BOD of the milking parlor wastes entering the first cell of the waste treatment system averaged 699 mg/l, and the BOD of the free stall alley wastes entering the first cell averaged 758 mg/l. The overall treatment efficiency of cell 1 (reduction in BOD) was 62.9%. The overall treatment efficiency of cell 1 plus cell 2 was 86.5%.

MECHANISM OF ORGANIC ADSORPTION ON ACTIVATED CARBON,
Maryland Univ., College Park. Dept. of Civil Engineering.
J. T. Cookson, Jr.
Available from the National Technical Information Service as PB-224 813, $5.25 in paper copy, $1.45 in microfiche. Maryland Water Resources Research Center, College Park, Technical Report No 17, April 1973. 59 p, 10 fig, 13 tab, 36 ref. OWRR A-014-MD (1). 14-31-0001-3020.

Descriptors: *Waste water treatment, *Activated carbon, *Chlorinated hydrocarbon pesticides, *Organic compounds, *Toxins, Water pollution sources, Water supply, *Adsorption, Tertiary treatment, Water purification, Methodology, Evaluation.
Identifiers: *Synthetic organic pollution.

Some knowledge is provided on the physicochemical nature of organic adsorption from aqueous solution on activated carbon. Carbon surface characteristics, as well as interactions with adsorbates were studied. Filtrasorb 200, a commerical activated carbon produced from coal by high temperature steam activation, was used as the adsorbent with various adsorbates. Surface characteristics of the commercial activated carbon were modified by outgassing at different temperatures, and by dry and solution oxidation. Equilibrium and kinetic studies are conducted in batch systems, under controlled conditions of pH, ionic strength and temperature. The adsorption of mercaptan is complex. Three simultaneous phenomena occur: adsorption of the mercaptan, its oxidation to disulfide catalysed by the activated carbon and adsorption of disulfide. Mechanisms for the catayitic activity of activated carbon involving the quinone groups and metal ions are proposed. The adsorption of mercaptan is studied in the absence of oxygen. Copper and iron on the surface of the carbon significantly influence the adsorption of butyl disulfide. The adsorption energy and the adsorption rate decrease when metals are eliminated, indicating ion-induced dipole interactions. Parahydroxybenzaldehyde exhibits highest affinity probably due to a strong interaction of the aromatic ring with the carbon's surface carbonyl groups. The rate of adsoprtion of butyl disulfide , carbon surface oxides cause a reduction of more than two logs on the rate of adsorption. Rate of adsorption of p-hydroxybenzaldehyde is only slightly affected by the presence of the acidic surface oxides. (Woodard-USGS)

SPRAY DISPOSAL OF SEWAGE EFFLUENT,
Pennsylvania State Univ., University Park. Dept. of Agricultural Engineering.
E. A. Myers.
In: Proceedings of Conference on Toward A Statewide Ground Water Quality Information System and Report of Ground Water Quality Subcommittee, Citizens Advisory Committee, Governors Environmental Quality Council: University of Minnesota Water Resources Research Center Mimeo-

graphed Report, p 92-99, February 1973. 1 fig, 2 tab, 9 ref. 14-31-0001-3823.

Descriptors: *Water reuse, *Spraying, *Sprinkler irrigation, *Waste water disposal, Path of pollutants, Waste treatment, Sprays, Infiltration, Recharge.
Identifiers: *Spray irrigation.

Spray irrigation for final disposal of sewage effluent is safe and appropriate when the systems are adequately designed and conscientiously operated. Only certain pollutants can be removed appropriately by the absorptive, biological, chemical, and physical reactions with the mantle. Other pollutants can completely destroy this living filter, thus producing additional pollution rather than renovation. Reuse of renovated water usually is governed by need, economics, and local legal limitations. Potential outlets include industrial, domestic, and agricultural uses. Ultimately salt may be a problem with reuse of reclaimed sewage effluent unless it is properly blended with freshwater or desalinized, as each time it goes through a cycle of domestic use it picks up about 300 ppm of salt. LEAST-COST ALLOCATION AND VALUATION MODEL FOR WATER RESOURCES,
city Univ. of New York. Dept. of Mathematics.
H. P. Young, and R. G. Thompson.
Water Resources Research, Vol 9, No 5, p 1186-9985, October 1973. 2 fig, 13 ref.

Descriptors: *Economic efficiency, Water quality, Waste treatment, *Waste assimilative capacity, *Regions, Technology, Costs, Optimization, Marginal costs, Water allocation (Policy), Water values, Equations, Mathematical models, Systems analysis, Water demand.
Identifiers: *Environmental quality, *Quadratic programming, *Cost minimization, Nonlinear programming.

An optimization model is presented which considers both economic efficiency and environmental quality. The model allows for trade-offs between the technologies of water use and waste treatment and the capacities of different regions for waste assimilation in determining how much water will be used and how much waste, to discharge in each region. The objective is to determine the combination of production processes in each region that minimizes the over-all cost of meeting the demands for goods and for water quality, subject to resource availability by region. The input-output coefficients of water-using production processes are written as functions of intake water quality so that the feedback effects of waste discharge on the economic process itself may be evaluated. The incorporation of the feedback effects necessitates a nonlinar formulation of the problem; it is shown that a nonlinear formulation can be obtained to a good approximation by a linearly constrained quadratic program. This model could be used to evaluate water development projects on a consistent basis; in particular it would calculate the marginal values of water in different regions and the marginal costs of meeting different water quality objectives. Since it includes the economic trade-offs between different technologies and production regions, such a model provides an accurate determination of the value of water in different uses. (Bell-Cornell)
W74-00670

THE EFFECTS OF WATER TEMPERATURE AND ELEVATION UPON AERATION,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
J. S. Hunter, and J. C. Ward.
Available from the National Technical Information Service as PB-224 814, $4.75 in paper copy; $1.45 in microfiche. Presented at the Symposium on Wastewater Treatment in Cold Climates, University of Saskatchewan Saskatoon, Saskatchewan, Canada, August 22, 1973. 46 p, 8 fig, 2 tab, 24 ref. OWRR A007 COLO (3), 14-31-0001-3506.

Descriptors: *Aeration, *Water temperature, Altitude, *Oxygen, *Dissolved oxygen, *Air temperature, *Elevation, Waste water treatment.
Identifiers: *Oxygen transfer, Low water temperature, High elevation, Oxygen aeration, Mechanical aeration, Atmospheric pressure.

A laboratory-scale mechanical aeration system was used to examine the variation in oxygen transfer rates into water as a function of water temperature (0 to 40C). The over-all volumetric mass transfer coefficient, liquid phase base, increased linearly with water temperature at a rate of 2.84% per C. The relative aeration efficiency decreases with increasing elevation, water temperature, and dissolved oxygen concentration. For zero dissolved oxygen and elevation, the rate of oxygen transfer per unit volume and time is independent of water temperature for 0 to 50C. Equations were developed relating saturation dissolved oxygen concentration to temperature and atmospheric pressure to elevation and air temperature. An equation was developed for predicting average annual air temperature (for locations in the U.S.) from elevation, longitude, and latitude: T ± 96.3 - 1.352N + 0.142W - 1.59 E where T ± air temperature, F; N ± degrees north latitude; W ± degrees west longitude, and E ± elevation in thousands of feet.
